I desire to add that all the results I have related have been accomplished with the Secretary's assistance. No new legislation has been necessary and all that has been required of me has been to present the need and desirability of changes and improvements in order to receive the Secretary's sympathetic attention. He does not blindly yield to suggestions, but gives them the most earnest and thoughtful consideration. As the Secretary has often reiterated, his only requirement is that the proposed change shall add to the efficiency of the Navy in order that both the Navy's personnel and material may be capable of rendering, and may be made to render, 100 per cent efficiency. This policy of 100 per cent efficient service has been the basic creed of the Office of Operations, and when we shall have fulfilled that policy every unit of the fleet will at all times be ready to perform its functions, whatever the occasion that may require its service.

OBSESSED WITH IDEAS OF PRUSSIANIZING THE AMERICAN NAVY.

One line of testimony has been given to this committee which deals with what was done or left undone by me personally, although it refers to a period two years or more antecedent to the war. Admiral Fullam and Admiral Fiske have both told the committee in describing their dealings with me when I came to the department and found them occupying positions as assistant and advisers to the Secretary of the Navy, that in spite of my alleged courtesy and consideration, I would not take an interest in plans for war. I should like to explain this to the committee, as underlying it is a question of vital interest to the Navy of the United States, to the Congress of the United States, and to the people of the United States.

Admiral Fiske's conception—first, last, and all the time—of the first and essential step necessary to put the Navy in a condition for war was that the civilian Secretary of the Navy should be reduced to a position somewhere between that of a figurehead and a rubber stamp. Admiral Fullam took very much the same line, although when I first came into office his main idea seemed to be that it was essential in order to prepare the Navy for war, that the marines be taken off of our ships. I discovered very soon that this was a revival of an old contention raised some years before by Admiral Fullam, and I took no interest in raising it again.

When I had listened "with patience and courtesy" to Admiral Fiske a number of times explain his idea with reference to preparation for war, and it became clear to me that they were substantially as I have described above, I did lose interest and was unwilling to have him again thrash over the same old straw. Admiral Fiske presented practically nothing to me dealing with the preparations of the Navy for war during the two years he served as aid for operations which was not tinged with his primary feeling as I have described above. This was such an obsession with him that—situated as he was, an immediate aid and adviser to the Secretary of the Navy and presumably having some obligations of loyalty, not to me individually, but to his superior officer—he undertook, surreptitiously and secretly, to impose his ideas as above. In combination with six

other officers (subordinate officers in the department) and with a Member of Congress named by him in his book, who was a former officer in the Navy and at that time (1915) a member of the majority side of the House Naval Committee, Admiral Fiske got up proposed legislation for a chief of naval operations, which was taken up and pressed by the Member of Congress in question and was as follows. I quote from the bill H. R. 20975, third session, Sixty-third Congress, reported January 16, 1915:

There shall be a Chief of Naval Operations who shall be an officer on the active list of the Navy not below the grade of rear admiral, appointed for a term of four years by the President, by and with the advice and consent of the Senate, who, under the Secretary of the Navy, shall be responsible for the readiness of the Navy for war and be charged with its general direction.

Now, observe under this bill the Chief of Operations will be responsible for the readiness of the Navy for war, and be charged with the general direction of the Navy. He would oust the Secretary of the Navy and become the Secretary of the Navy.

The CHAIRMAN. But it says "under the Secretary of the Navy."

Secretary DANIELS. Well, of course, it says that, but as John D. Long pointed out, when any such words as those are used, it is not long before precedent hardens into militarism. [Continuing reading:]

All orders issued by the Chief of Naval Operations in performing the duties assigned him shall be performed under the authority of the Secretary of the Navy, and his orders shall be considered as emanating from the Secretary, and shall have full force and effect as such. To assist the Chief of Naval Operations in preparing general and detailed plans of war, there shall be assigned for this exclusive duty not less than 15 officers of and above the rank of lieutenant commander of the Navy or major of the Marine Corps.

It will be observed that Admiral Fiske proposed to make the Chief of Naval Operations responsible for the readiness of the Navy for war, a responsibility then and now divided among a number of able officers of the Navy, the commander in chief, and the Congress. Authority is a necessary complement of responsibility, and with this legislation on the statute books, Admiral Fiske, or whoever held the office, could have demanded authoritatively any legislation or taken any action in connection with the Navy which, in his opinion, was necessary to carry out the functions for which he was responsible. It was regarding this proposed legislation that I am correctly quoted by Admiral Fiske in his book by saying at the time that as far as the Secretary of the Navy was concerned, should this legislation pass, he might as well be at the top of the Washington Monument, without a telephone. I may add that Admiral Fiske talked to me so many times about this, and rarely about anything else, that he did not bring this in; and I was very glad, at first, to hear him, because I always give very careful and patient consideration to anything that the naval officers bring to me; and I told him to draw me up a diagram, pointing out how his plan would work. He did so, very elaborately, and when he finished I said, "Well, what power has the Secretary in all your organization?" "Oh," he said, "he is above everything. He is over everything." I said, "Well, what power has he got?" And, of course, the whole program, and the whole program of all this organization, is to place the Secretary of the Navy in the Washington Monument and not give him a telephone, so that he

will not know anything that is going on, and just "sign here." Un-American!

At the time Admiral Fiske found me so unresponsive to his proposed preparations for war, he was obsessed with the idea that the German general staff organization was, militarily, the most perfect thing on earth. Presumably the proposed legislation I have quoted was his conception of a Prussian staff. As a matter of fact, probably in no country—certainly in no English-speaking country—has there ever existed any such organization giving the military such absolute control. So far from being patterned after the Prussian general staff model, Admiral Fiske's surreptitious legislation would have put an officer of the United States Navy in a position where he would have had the powers and authority of the Prussian chief of the admiralty staff, Von Tirpitz, and the Kaiser himself combined in one.

Had I listened sympathetically to Admiral Fiske's war preparations along the line indicated by his surreptitious proposed legislation, the American Navy would have been at war long before April 6, 1917, but it would have been an internal war, and the wonderful record made by the Navy from April 6, 1917, to November 11, 1918—a record which this country can justly take pride in—would never have been made.

It is an unfortunate fact that a large per cent of the officers of the line of the Navy would have favored then, and would favor to-day, such legislation as Admiral Fiske proposed. This is due largely to the fact that so many prominent and distinguished officers, such as Admiral Fiske, have advocated such legislation in the past and indoctrinated some young officers with the idea that the American Navy could or should be independent of civilian control, whether of a civilian Secretary, a civilian President, or a civilian Congress.

It was but recently, when I found it so fully set forth in Admiral Fiske's book, "From Midshipman to Rear Admiral," that I learned of his underhand activities in the early part of 1915.

The regulations of the United States Navy provide—

No person belonging to the Navy or employed under the Navy Department shall attempt directly or indirectly to influence legislation in respect to the Navy without the expressed authority and approval of the department.

* * * * *

In accordance with the provisions of the preceding paragraphs, all officers of the Navy and Marine Corps shall refrain from any attempts to influence legislation by submitting drafts of proposed bills, or by arguments, recommendation, or otherwise, except through the regular official channels. This prohibition shall be construed as applying to all bills whose import tends in any way to affect the administration, status, or strength of the Navy, or of any corps or bureau. Such recommendations or suggestions for legislation as may seem desirable shall invariably be presented to the Secretary of the Navy for his consideration.

These regulations, I may say, existed many years before I became Secretary of the Navy. The regulations read this way in 1915, and yet Admiral Fiske, in secret conference with six other officers, prepared this bill without my knowledge or consent, and attempted, secretly and surreptitiously, to "put it over."

Let me say at once that I have never rigidly enforced the above-quoted provisions of the Navy Regulations. I have repeatedly not only authorized but encouraged bureau chiefs and other prominent

naval officials to appear before committees of Congress in advocacy of legislation which I personally did not favor. So far as I know, no Secretary of the Navy before me ever approved in toto the reports of the General Board. As a rule I have not done so either, but I was the first Secretary who ever furnished Congress with these reports so it might have the benefit not only of my own advice and opinions but of complete knowledge and the opinions of the distinguished officers constituting the General Board.

In 1914 Admiral Fiske thought there should be provision for a few thousand more naval personnel than I had recommended. He appeared before the Naval Committee and advocated these additional men; and it appears from his book that he did this with much trepidation, expecting to be severely disciplined. His trepidation was wholly unwarranted. Nevertheless in 1915 Admiral Fiske, as principal adviser to me, under the then organization of the Navy Department, holding a peculiar position of trust and confidence with respect to the Secretary of the Navy, undertook action concerning legislation which I will not undertake to characterize. At that time I had come to the conclusion that it was necessary to make some change in the organization of the Navy Department which I had found when I entered office nearly two years before. This conclusion was not reached hastily. The organization I found was given a full and fair trial, and I had consulted freely with numerous officers on the subject of changes necessary and desirable. I had listened for hours, not only to Admiral Fiske but to other advocates of the so-called "general staff" organization. The words "general staff" of themselves mean nothing. The Army has had a General Staff for many years, instituted by Secretary Root. Some years later Mr. Root, then Senator from New York, stated on the floor of the Senate that the General Staff of the Army as then operating was entirely different from what was intended and contemplated at the time the legislation he recommended was adopted. Yet the legislation had not been changed and the name was the same.

There have been all kinds of general staffs proposed for the Navy, but the underlying idea of every such proposition that I have seen is much like that set forth in the Fiske general staff or so-called Office of Operations, which I have quoted.

We have all as children read the fairy tales where the lovers were "married and lived happily ever after." During the seven years that I have been Secretary of the Navy I have listened to many proposed staff organizations which, if only adopted by a benighted Congress would insure that nothing would ever go wrong with the Navy. Of course it is impossible to prove definitely the results of an untried organization. But I have not been convinced in seven years, and I would not be convinced in 70 years, that it would be a desirable thing to turn over bodily the United States Navy to a clique of officers of the line that might be enabled to gain the favor of the changing administration.

A GENERAL STAFF WOULD HAVE PREVENTED 800-TON SUBMARINES.

Admiral Grant has testified before your committee, rather bitterly, as to the difficulties he experienced in getting the 800-ton submarine adopted. He does admit that the Secretary of the Navy would

listen, and the record shows that at least one chief of bureau and the Secretary of the Navy recommended building some 800-ton submarines. It is a fact that the Chief of Operations and the General Board were opposed to it. The record shows that the House Naval Committee went fully into the matter and had extensive hearings, and although Admiral Grant did not cause the abandonment of the smaller submarines (and I am not saying that the Chief of Operations and the General Board did not have good arguments and reasons for their position)—

The CHAIRMAN. What was the date of this, do you remember?

Secretary DANIELS. I think this was in 1915. I will find the date.

The CHAIRMAN. Who was Chief of Operations?

Secretary DANIELS. Admiral Benson. I remember now. Admiral Grant was put in charge of all the submarines in the spring of 1915, and got authority to do anything and everything necessary to get the submarines in fine condition and keep them so; and I will say, parenthetically, that if anything about the submarine did not function properly and was not well organized after the spring of 1915, Admiral Grant was in entire charge. I shall come to that, however, in another part of my hearing.

The record shows that the House Naval Committee went fully into the matter and had extensive hearings, and although Admiral Grant did not cause the abandonment of the smaller submarines (and I am not saying that the Chief of Operations and the General Board did not have good arguments and reasons for their position), the fact remains that in the very first appropriation bill after Admiral Grant began advocating the 800-ton submarine, which was really the first opportunity to take up their construction, there was a provision for 800-ton submarines. This provision was recommended by the Chief Constructor of the Navy and the civilian Secretary of the Navy. If we had had a general staff of the type proposed by Admiral Fiske, or even of a much milder type—one of the 57 varieties, which I believe have been proposed to me—and the Chief of Staff had been opposed to what Admiral Grant wished, that would have been the end of the matter. It is doubtful if we would have had a single 800-ton submarine authorized by this time.

POSITION OF CHIEF OF OPERATIONS CREATED.

Before passing from Admiral Fiske and the lack of interest in preparations for war, which he ascribes to me, I might remark that in 1915, after nearly two years' study of the problem, I did recommend a material change in the organization I found when I became Secretary of the Navy, by the establishment of an Office of Operations, with powers, however, entirely different from those proposed in the legislation surreptitiously brought forward by Admiral Fiske. At that time I was in complete ignorance of his surreptitious legislative activities. The committee will find that the legislative provision for the Office of Operations, as passed in 1915, was practically identical with that recommended by me. Under it you may call the Navy Department organization a General Staff if you will, though not the Fiske General Staff. Whatever it is called—and I want to emphasize this, Mr. Chairman—it proved sound under the stress of war. It gives the line officers of the Navy full authority

and responsibility within their proper sphere, while still allowing the civilian Secretary, the commander in chief, and Congress some latitude in fixing questions of policy, expenditure, etc. It is not perfect, but any organization which showed itself so flexible, efficient, and successful during the World War as that of the Navy Department, is perhaps entitled to some credit. Nevertheless, your committee will find that in a majority of the line officers appearing before it, if questioned, would advocate the General Staff organization of the department, or something approaching it. Agitation along this line in the Navy has been persistent for years. You gentlemen of the Congress with whom rests the ultimate responsibility will be importuned for legislation along this line in the future as in the past.

Now, I have here a hearing of April 28, 1904, before the House Committee on Naval Affairs, in which Mr. Charles H. Darling, Assistant Secretary of the Navy, took the ground and made a very able argument against transferring from a civilian head to a military head control of the Navy, and I think I will not read all of this, Mr. Chairman, but will put it in the record, if you think it is not necessary.

The CHAIRMAN. No; I guess not. You can put it in the hearing.

Secretary DANIELS. It is a very able argument, with questions and cross-questions, and as the result of all this in 1904 Congress refused to sanction any transfer of authority from a civilian to a military organization.

SECRETARY DARLING ON THE DANGER OF PRUSSIANIZING THE NAVY.

Sixteen years ago, under President Roosevelt, there was a comparatively mild movement in this direction, which was apparently so disguised that the then Secretary of the Navy did not at first appreciate it and recommended legislation making of the General Board a virtual General Staff. Nothing finally came of it, but there was much testimony before the Naval Affairs Committee of the House at that time, and I should like to invite attention to the statement made then by the Assistant Secretary of the Navy, Charles H. Darling, who "spoke out in meeting." His statements and reasoning are as applicable to-day as they were then. I find myself in full accord with them and wish to include them in my present statement for the benefit of the committee.

(The portion of the hearing referred to is here printed in the record, as follows:)

WASHINGTON, D. C., *Thursday, April 28, 1904.*

Hon. George E. Foss, chairman, presiding:

STATEMENT OF MR. CHARLES H. DARLING, ASSISTANT SECRETARY OF THE NAVY.

The CHAIRMAN. Here is the bill, Mr. Secretary. We will be glad to have your views briefly and in your own way as to this bill that is pending before the committee for consideration. As you will see, the bill provides "That the Secretary of the Navy is authorized, in his discretion, to constitute a General Board by detaching not to exceed seven officers on the active list of the Navy and Marine Corps, not below the rank of captain in the Navy, for such general military duties as the Secretary may from time to time direct."

Mr. DARLING. Would you prefer that I express my views in narrative form instead of answering interrogatories?

The CHAIRMAN. Yes; I think probably that would be more satisfactory, unless you want us to ask questions, and in that even we can. Go ahead in your own way.

Mr. DARLING. I do not appear here at my own solicitation to oppose this measure which has been presented by the Secretary. I do not feel like urging upon the committee my personal views.

Let me say, once for all, that the most cordial relations exist between myself and the Secretary, the admiral of the Navy, the chiefs of the respective bureaus, and all advocates of the general staff. The Secretary is fully acquainted with my views, and I speak with his full knowledge and consent.

Mr. DAYTON. That is the glory of this department—that it knows Congress wants the views of all men, knowing that even the best men disagree.

Mr. DARLING. I am in the position of a dissenting member of the court, and, with the profoundest respect for the Secretary and the advocates of the general staff, I am unable to agree with them in their views.

Among other reasons, I disapprove of this measure on three general grounds: First, the effect of this measure will be to make the Secretary of the Navy an ornamental figurehead; second, the measure savors too much of militarism to be consistent with the spirit of our institutions, even in the administration of the Navy Department; third, which is the corollary of the second, the military element of the Navy Department already has all the power and all the influence that it ought to have, either in the administration of the department or in making recommendations to Congress. I base my conclusions upon my observation and experience during the time I have been in the department.

Mr. DAYTON. How long have you been Assistant Secretary?

Mr. DARLING. Since the fall of 1901, during which time I have seen the passing of a Secretary and every chief of bureau save one. I came to the Navy Department from an inland State, having no special interest in the Navy Department or any of its branches. I came without prejudice and with nothing to unlearn.

Mr. DAYTON. I am glad to hear that there is one man like myself.

Mr. DARLING. So I have derived my conclusions from observing the working of the department.

While the bill provides that the Secretary may detail certain officers to such general military duties as he may from time to time direct, it is claimed that it is the intention of the bill to create only an advisory board. I am not concerned particularly with the wording of the bill. I am looking only to its effect, and that effect will be substantially the same whether it passes in its present form or whether it is limited to advisory purposes only.

With the exception of the third section, the Secretary already has authority to do all that he could do were this bill to become law. This demonstrates, therefore, that the bill relates only to the internal administration of the department. The board now exists within the department by virtue of an order of the Secretary acting within his administrative authority. We have, then, presented the case of such a board now created and so existing seeking from Congress an act of independent incorporation. Congress has created the Navy Department and, among other things, has given the Secretary general unwritten administrative powers. Among these unwritten powers is the power to create this board, which power has been exercised by the Secretary. This board, not content with deriving its powers from the Secretary, now asks a special act of incorporation.

Under this bill, stress has been laid upon the power of the Secretary to create or dissolve this board at will. I call your attention to the statement of the Secretary before the committee wherein he says: "Under this law the board is in the hollow of the hand of the Secretary. It may be dissolved at any moment." Passing two pages in his testimony, in answering a question asked by Congressman Rixey, we find:

"Mr. RIXEY. I understood you, Mr. Secretary, a few moments ago, to state that the bill would leave it in your discretion whether you would appoint this board or not.

"Secretary MOODY. Entirely.

"Mr. RIXEY. You would not consider the enactment of the bill as a direction to you to appoint the board?

"Secretary MOODY. I would consider, if I did not do it, that I failed to do it at my peril, and if I make mistakes on military questions without it, the country would hold me responsible for not using this authority given me. I think no Secretary would be likely to disregard the power given him here."

Here, then, lies the first fallacy. The department brings before you a bill and advocates this board on the ground that the Secretary would hold it in the hollow of his hand, with power to make or dissolve it at will, and then concedes that when this board has once become incorporated no Secretary would ever dissolve it. Perpetuity and perpetual succession here, as in all corporations, is the first purpose in incorporating. And if this bill were to become law, the board would not be dissolved. It would be much like the case of a bureau in which the Secretary now has authority on the termination of the office of a bureau chief to decline to recommend or appoint a successor and distribute the work among other bureaus as his judgment would dictate, and thereby strike down the bureau itself. But no Secretary would be likely to undertake the task of dissolving such a board, or strike down a bureau, or of consolidating the work of the bureaus, notwithstanding his authority, without an expressed provision of Congress.

Now, when this bill shall have become law, and when the Secretary has appointed this board and has appointed the member as military adviser, that adviser will be the only legally authorized official adviser of the Secretary. Upon the legal principle that the expression of the one is the exclusion of the other, this military adviser would at once claim that advice to the Secretary from the service was exclusively within his jurisdiction.

The CHAIRMAN. Judge, right there, don't you think he would call on the bureaus?

Mr. DARLING. I am coming to that in just a moment.

The CHAIRMAN. Excuse me.

Mr. DARLING. Give this chief adviser the highest rank in the Navy next to the admiral, and the word would soon be passed down the line that he was the official adviser, that none other need apply, and that all information must come to the Secretary through him. He being the legally authorized source of information and advice, the practice would be that all the Secretary's information with respect to the department would come filtered through that one source.

Now, it is suggested that the bureaus and all other sources are open. That is true, as a matter of law. The practice, however, would be to bring that officer, the chief spokesman of the advisory board (the Chief of Staff), immediately into contact with the Secretary, and without the slightest question, he would be in closer touch with the Secretary than any other or all others put together. And with that position given, you may limit this law or hedge it about as carefully as you will, that adviser will have the advantage whereby he will make himself the only recognized official adviser of the Secretary. Give the adviser that position, and the only limitations with respect to the subjects upon which he will give advice will be the restrictions that he imposes upon himself.

Napoleon, I think, once said: "Give me the educating of the children of France for 10 years and in 20 years I will rule the world."

Let a new secretary come into the department, uninformed on naval and military matters, give him one man who will be his only official adviser for six months, and in one year he will own the secretary.

It is also suggested that the secretary can free himself of this at once and at will. That is easier said than done. A secretary is not likely to feel that he is unduly influenced under those circumstances, but that constant dropping in his ears, like the constant dropping of water upon a stone, wears away all obstructions and moves him when he is not aware. The school boy uses his sponge to rub the marks from his slate, but, however vigorously he may apply the sponge, he eventually discovers that at some time, he knows not when, the pencil has scratched and the marks are there.

Again, the Secretary stated that this board should have but 7 members, and yet at the present time it has 12 in addition to the Admiral, making 13. When the Secretary came into the department, according to the Naval Register next preceding, it had 11. Now, in addition to the 13, it also appears in the last register that there are on duty with the General Board 2 commanders, 1 lieutenant commander, and 1 lieutenant, making 17. These last four are not members of the General Board, but are on duty with the board.

Mr. BUTLER. Excuse me; what are their duties?

Mr. DARLING. Such duties as the General Board may wish along their line. Understand, however, that these last four have no voting authority.

Mr. BUTLER. That makes 17 line officers?

Mr. DARLING. Yes; in addition to that, there are two others engaged in the study of target practice under the General Board.

Mr. RIXEY. What rank have they?

Mr. DARLING. A lieutenant commander and a lieutenant. I am not criticising the value of their work. I speak only concerning the view of the Secretary, that seven are enough.

Mr. MEYER. But, Mr. Secretary, are not some of these officers engaged in other duties?

Mr. DARLING. Yes, sir; a good many of them have other duties, but the point is that there are 17 or 19 men on or engaged with the General Board.

Now, if the Secretary will hold this board in the hollow of his hand, why this number, if seven, is sufficient? Does it need an act of Congress to reduce the board to its proper size?

Mr. BUTLER. Has he not authority to dissolve it or reduce it in number?

Mr. DARLING. It is the Secretary's creature.

The CHAIRMAN. It is created by regulation?

Mr. DARLING. Created by general order.

Mr. MEYER. His own general order?

Mr. DARLING. The general order of the Secretary.

Now, while there are seven only provided by this act, it would be perfectly competent to do under this act just what now appears by the register to have been done; that is, detail any number to duty not on but with the General Board, and with this act as a law the name of that number would be legion.

On the same principle the Secretary said that he would have no bureau chief or bureau officers on the board. Authority is now in his hands, and yet bureau officers are on the board.

The CHAIRMAN. In other words, judge, you take the position that he can do everything now that he can do under the first section of this bill?

Mr. DARLING. Yes, sir; and I maintain that more has been done than ought to have been done already. And you are asked to incorporate this board that it may have more power.

It may be suggested that this measure is a restrictive measure; but such is not the intention. No one has been before you, I dare say, advocating the passage of this bill on the ground that the board has now become so powerful that the department thought it necessary to have legislation in order to restrain it. That has never been suggested. That is not the proposition. Its purpose, on the other hand, is to extend or strengthen the powers of the General Board.

Now, in the matter of the necessity for its being established by law, it is claimed that its future efficiency depends upon its being so established, and that in view of the fact that it has been established by order as an experiment, good faith with Congress demands that it shall be established by law. Such, however, is not the history of the internal administration of the department.

The office of naval intelligence has been in existence something like 15 years. It has pursued the even tenor of its way during all that time, collecting information, digesting and preparing the same for the use of the Secretary, and yet has never been established by law.

The Naval War College has not been established by law.

The CHAIRMAN. How was it established?

Mr. DARLING. By order of the Secretary; just like the present General Board.

The board on construction was established by Secretary Tracy in 1889, and has never been established by law. By that order it was provided that certain bureau chiefs "shall constitute a board having general supervision over the designing, constructing, and equipping of new ships for the Navy." Under that order millions of dollars' worth of ships have been constructed. Questions of far-reaching importance to the Navy have been considered by this board. It has kept fairly within the spirit and letter of this order. It has never insisted that it should be incorporated, and consequently it has never occurred to any Secretary that it should be. Its work has been of exceeding great value to the department and to the service, and there is no more reason for incorporating the General Board than for incorporating this.

The Naval Academy was not at first established by law, and, like the general government of our navy yards, now rests largely on the authority of the Secretary to administer the internal affairs of the Navy Department.

It is true that as it has become necessary to erect buildings or incur expense with respect to some of these institutions, Congress has so far recognized them as to make appropriation for their maintenance, but except as

appropriations have been provided their existence has generally been left to that authority of the Secretary to administer his department. And I understand it to be one of the arguments for this bill that it carries with it no appropriation, and, I would therefore add, needs no recognition from Congress.

Referring to the question of the necessity for more military power and more military advice, while it is recognized that the Navy primarily exists for the purpose of maintaining the fleet afloat, a vast amount of the work in connection with the administration of the Navy is civilian work, pure and simple.

THE CHAIRMAN. Will it be called military, coming within these terms—general military duties?

MR. DARLING. It is maintained by some that everything pertaining to the administration of the Navy, even to the smallest details, is military work, but I am unable to agree with those holding such views. The building of a battleship is purely civilian work. There are private contractors that even build guns. The armor plate is made wholly by private contractors. Our big private shipyards can build a battleship from truck to keelson—every feature and detail of it. It is entirely a matter of business administration.

The building and administration of the navy yard has its exact counterpart in the various private yards of the country. The furnishing of supplies, the construction of buildings, the administration of yards, the management of shops, is all work of civil administration. We have the various corps and branches of the service—the Marine Corps, the Pay Corps, the civil engineers, the constructors, the professors of mathematics, and the line. Now, the line is overwhelming in size as compared with all others put together. We have for this military duty that we are talking about the office of Naval Intelligence, with naval attachés all over the world. They are at work getting together and preparing this same military information that is being referred to. We have the War College, the duties of which are to work out these same problems. We have the fleet afloat everywhere, under the command of line officers, and we have the work of the various bureaus. In addition to all this, we now have this General Board.

MR. RIXEY. Mr. Secretary, could you give us the number of officers who are employed or engaged in these departments which you have mentioned?

MR. DARLING. The January number of the Register shows that there are at the Naval War College proper two captains, three lieutenant commanders, one lieutenant, and one major of marines. In addition there are on special duty at the War College a rear admiral, retired; a rear admiral on the active list, and a captain, and in attendance on the course of the college one captain. The War College, however, does its greatest work during the summer season, when there are in general a far greater number of officers on duty there than now.

In the Office of Naval Intelligence there are one captain, two lieutenant commanders, one lieutenant, and one assistant engineer, retired.

MR. ROBERTS. How many attachés, Mr. Secretary?

MR. DARLING. There are now only four regular, but there are some additional ones on special duty at the present time.

MR. DAYTON. Does the Hydrographic Office have anything to do with obtaining this information?

MR. DARLING. Well, I may say, strictly speaking, no. I have no doubt but that information that comes in through that source is of military value. Of course, all matters of navigation bear upon that subject to a certain extent, but in regard to the military information we are speaking of, I think it may be said that the Hydrographic Office has no special duties charged upon it in that respect.

MR. RIXEY. I would like to ask you this question: Can you tell us briefly the duties of the War College?

MR. DARLING. The duties of the War College are to study war problems and military tactical questions.

MR. RIXEY. As to the size of fleets?

MR. DARLING. All things of that sort. That is a very elastic body—Congressmen, with very elastic duties. There is a president of the college and certain officers are assigned there from time to time, and they carry on such military and tactical investigations as seem to them in charge to be of importance to the service and advantage to the Government. Their investigations may take very wide scope. When a question comes up that they feel they want to study, it is practically left to the discretion of those in charge of the War College.

Mr. RIXEY. Is that War College a continuing body?

Mr. DARLING. Yes; well, a continuing body; what do you mean by that?

Mr. RIXEY. I mean by that, has it existence all the time?

Mr. DARLING. Yes, sir.

We have these forces: The War College, the Office of Naval Intelligence, various attachés, the fleet afloat, the officers of the line on regular and special duties, together with this General Board. These are all engaged to a greater or less degree in the study of war plans, tactical problems, military duties, and digesting military information.

The officers are able, conscientious, and enthusiastic, and it can not be said that the military work of the department is suffering or being neglected.

I know of no reason whatever why this board should be established by law. The claim that the board lacks standing and dignity is without foundation. Some of the ablest and brightest men in the Navy are serving on and with the board, and these men bring to the board the dignity and standing that it deserves.

It is in practice the most influential and the most controlling force in the Navy to-day. Although it has no authority to issue orders, nevertheless, on a proposition fairly within its jurisdiction, in practice it outweighs the judgment of any bureau.

It is asserted that the board should be established by law in order that it may have more strength and force and that its recommendations may become more binding upon the Secretary and the department.

If its work were confined to the fleet and such moral force were given to the recommendations of the board as to make them practically binding upon the department, the military element would then control the conduct of the fleets in all particulars. It would determine whether the fleet should cruise at the rate of 8 or 16 knots per hour; whether in single or squadron formation; whether navy yards should be congested from overwork or demoralized from idleness; whether contracts should be made and supplies obtained by competition or selection; whether the fleet should take long or short cruises, continuous or intermittent; whether we should assume conditions of peace or assimilate conditions of war; whether ships should be used with care and safety or take chances in darkness and fog.

These are the orders that affect the consumption of coal, the expenditure of supplies, the extent of repairs, the wear and tear of ships, and the liability to loss—in short, these are the orders that control your appropriations.

And when this military advisory board is made responsible for these orders the country will be confronted with the proposition that the hand that bears the sword will hold the purse, a principle diametrically opposed to the genius of our institutions.

Again, this chief adviser, outranking all others in the service save the admiral, with this advisory board, would constitute an oligarchy in the service, and it would soon be found that desirable assignments and opportunities for advancement could only be secured by catering to this board and accepting its theories. Those in close touch would be favored, those not in close touch would be forever out. There have always been cliques in the service, and they have always caused embarrassment. This board legalized would provide great opportunity for a clique to get possession of and administer the Navy. Should an occasional Dreyfus case result, it would be most disastrous to the country, to the Navy, and to the officers themselves.

Mr. ROBERTS. Mr. Secretary, have you expressed your view of the third section of this bill as to a military adviser?

Mr. DARLING. I have not discussed the third section specifically, but have stated my views with respect to this military adviser generally.

Mr. ROBERTS. If we stood by this, what would be your views on that?

Mr. DARLING. With respect to the advanced pay and increased rank, I know of no need of it whatever. It is perfectly competent, and I have never heard anyone question the right of the Secretary to have anyone for his adviser whom he desires.

Mr. ROBERTS. The thing that I had more particularly in mind was the increase of rank and pay.

Mr. DARLING. That does not appeal to me. The officer would be on duty at the department like any other officer.

The CHAIRMAN. You think that the board as now constituted is doing good work and is a good institution?

Mr. DARLING. Yes; I think the board has done some good work and is a good institution, but I would restrict rather than extend its powers and authority. The board has taken up a great many things that it ought not to. It has taken up the question of title to land—work that could be done in any law office, and which has no more military or tactical significance than the administration of a law office. It has undertaken the purchase of land. It has attempted to administer navy yards. It has undertaken to locate storehouses, machine shops, and other buildings within naval reservations. These questions are entirely without military significance. It has undertaken to construe and interpret treaties and contracts. It has undertaken to inform the department what legislation was needed. It has devoted much time and attention to the reorganization of the Navy Department, as well the civilian as the military side. It has prepared and circulated much literature advocating a general staff. In short, it has already invaded the province of civil administration and planted there the standard of conquest.

And so, while I say that the board has done much valuable work, I would, by careful regulation, limit its jurisdiction by order of the Secretary, without an act of Congress, and say to it, "Keep within those limits; for thus far shalt thou go and no farther."

Mr. ROBERTS. Do you see any particular objection to the pending bill, if there is a limitation put upon it that the powers of the board should be advisory only?

Mr. DARLING. Yes; for the reasons that I have stated.

Mr. ROBERTS. You would still think so?

Mr. DARLING. I have not the slightest doubt about it. Underneath all that appears on the surface of this bill it contains the foundation for the establishment of the great General Staff, of which we have heard so much. When you have an act spread upon the statute books of the Nation which recognized and adopts the plan laid down in this bill, the General Staff will need no further legislation. It is only just a step in departmental influence to all those schemes and subschemes and theories which are called the General Staff.

Mr. ROBERTS. Are you satisfied with the present bureau system in the department as giving the best results that could be obtained?

Mr. DARLING. All government is a matter of growth. There are things that could be improved. As a distinguished officer once replied, and, I thought, happily, when some one said that the bureau system was rotten and would go to pieces in a week in case of war: "It is not so; it simply needs the executive touch." That is exactly true.

Mr. ROBERTS. I was speaking more particularly of the administration of the department in time of peace. Do you think we are getting the best results with the least expenditure out of the bureau system; that there could not be improvement in the way of consolidation to some extent?

Mr. DARLING. I think there could be improvement, Congressmen, but I would not attempt that improvement along the line of this bill nor in the direction of the so-called General Staff.

The General Staff is essentially an Old World idea, and while the study of foreign navies is always profitable, it is unnecessary and unwise, in my judgment, to ape the monarchies of the Old World.

Our organization may be improved, but on the whole it is well adapted to our Yankee genius, and I believe that the American officer and the American sailor and marine may be depended upon in the day of his country's need.

Finally, I believe I hold these views in common with a large body of reliable, patriotic, conservative, thinking officers in the service.

Secretary DANIELS. As I have stated, in the early part of 1915 there was much discussion over my action in opposing the Prussianizing of naval administration. I had opposed the Fiske plan with its ouster of civilian authority and I had interned Admiral Fiske. Congress enacted an Americanized plan of operations, and it has been conducted upon American and not upon the Von Tirpitz model. As a result of my all-American policy certain papers were very indignant. One critic declared I had "personally blasted all hope of establishing that centralized, responsible military control which is the greatest need of the Navy." I regarded then and regard now that criticism as a decoration of honor. Of all the services I have tried to render

my country as Secretary of the Navy, nothing, except the full consecration of effort in the World War, in my judgment, has contributed so much to an American Navy as my successful fight against adopting the Von Tirpitz plan of organization of the Navy Department. During the debate in 1914-15 as to whether the American plan of civilian control should be superseded by the Prussian plan of military control, there were many editorials in leading journals. I append only one editorial, as follows. I wish to read this one editorial from the New York Evening Post of April 28, 1915, which is one of the most able criticisms I have ever read. [Reading:]

CIVILIAN CONTROL OF THE ARMY.

[Editorial in New York Evening Post of Apr. 28, 1915.]

The critics of Secretary Daniels, being driven from one position after another, are now making a stand against him on the ground that he has "personally blasted all hope of establishing that centralized, responsible military control which is the greatest need of the Navy." Ex-Secretary Meyer has again joined in the hue and cry by demanding a naval budget of a large lump sum from Congress, to be expended by the Secretary and his naval advisers alone as they see fit, and also a national council of defense, which shall all by itself formulate the defense policies of the Nation. The Navy Department clique, which is so upset over the failure of Secretary Daniels to appoint Rear Admiral Fiske to the new position of Chief of Naval Operations, is also ringing changes on this question, while the Tribune declares that if Secretary Daniels had only "consented the Navy would now have to all intents and purposes a general staff." But the unpatriotic North Carolinian had selfishly, it is alleged, "begrudged surrendering that inexperienced civilian control through his own office."

Well, if Mr. Daniels had done any less it strikes us that he would have been faithless to a fundamental policy of this Government. It is precisely civilian control over things military and naval. The founders of the Republic wrote that policy into the Constitution because they had personal experiences with British military control, which made them particularly insistent that civilian officials should be in charge. To turn over the framing of our Army and Navy policies to-day to the proposed national council, comprising, as we understand it, a majority of military and naval men, would be as dangerous a step toward militarism as could well be imagined. Buttressed by the absurd theory that military and naval experts should decide how much money we should expend for Army and Navy, when they are in no wise charged with the responsibility either for raising the money therefor or for ascertaining what is the real public sentiment as to armaments and war policies, we might then have a situation precisely analogous to that of Germany to-day. There the German general staff dictates to the Reichstag what it wants and, moreover, formulates the public opinion of the nation on matters military. As the war has clearly shown, the German general staff officers are the masters of the nation and not its servants.

Exactly the same thing is what lurks behind the proposal to substitute with us complete military control for civilian. The General Board of the Navy has raged because some of the Secretaries of the Navy and Congress regularly have refused to follow its recommendations as to the size of the Navy. They have preferred to put their inexperienced opinion above the expert. In our judgment, they have been both wise and patriotic in so doing. The expert in any field is subject to bias; and the military and naval experts particularly take counsel of their fears of attack from one source or another. From them emanate many alarms of war, while their narrow training, totally different from that of the civilian legislator or the civilians charged with the carrying on of foreign and national policies, often makes them dangerous national advisers. We know what a cry would go up if it should be proposed to turn over the conduct of our national affairs to a general staff of physicians and surgeons, on the ground that the dangers from unsound immigrants, from the spread of insanity, and the annual waste of human life due to preventable disease, made necessary the placing in their hands of our Nation's policies and the unrestricted expenditure of some \$250,000,000 a year.

As for ex-Secretary Meyer's proposal that Congress vote a lump sum to be expended annually by the Navy Department, this is so absurd as hardly to merit serious treatment. Congress would never consent to it, and neither would the American people, particularly not at this hour, when the European military experts are so completely discredited in their prophecies as to the insurance value of large armaments and as to the actual happenings in the progress of hostilities. Could experts be more thoroughly discomfited than the war lords of the German general staff? Pro-Germans in plenty do not hesitate to say to us that it has completely overreached itself; that its Belgian policy was a crime, and that its chief folly has been due to a total inability to understand what was involved in national policies and national sentiments abroad. Never were military men so fortunately situated; everything was in their favor in a Nation which obeyed their slightest wish, and never have men so written themselves down as hopeless blunderers. We do not believe for a moment that with this warning example before them the citizens of this country will be tempted to turn over its military and naval affairs to unformed diagnosticians.

But to reassure some of our frightened patriots it is only just to point out that Mr. Daniels is not only going to appoint a Chief of Operations—we venture to say that he will be quite as able an officer as Rear Admiral Fiske—but that he has repeatedly announced that he will make no choice until he has consulted with the leading officers of the service and worked out a complete reorganization of the Navy Department in order to make the new official the efficient head of the military side of the Navy Department. Even the Tribune runs the danger of waking up some morning and finding that Mr. Daniels has done within the department precisely what it desired, in which case we guarantee that it will take all the credit therefor to itself and give none to the Secretary.

I also append a copy of my testimony before the House Naval Affairs Committee along the line discussed by Secretary Darling when I appeared before the committee early in 1916. [Reading:]

At the last session of Congress you made a change in the organization of the Navy Department which was epoch making and which practically followed out the recommendations of what was known as the Moody Board. You authorized the appointment of a Chief of Naval Operations. Previously there was a council of aids, which Congress had refused to legalize. It was a fifth wheel in organization, and the last Congress changed that and made the Office of Operations. The President named Admiral Benson as the first Chief of Operations. I do not think it is well understood what that office is or the very efficient service it has rendered in the perfection of organization and efficiency of the Navy. If you will bear with me, I would like to refer and touch upon the importance of that office to show what it is empowered to do and what it has done.

The CHAIRMAN. What do you mean by "Secretary Darling"? You have referred to him as "Secretary Darling."

Secretary DANIELS. He was Acting Secretary—Assistant Secretary of the Navy.

The CHAIRMAN. Assistant Secretary of the Navy?

Secretary DANIELS. Yes. Then I have here the regulations for the office. This office was created in the following language:

"There shall be a chief of naval operations, who shall be an officer on the active list of the Navy, appointed by the President, by and with the advice and consent of the Senate, from among the officers of the line of the Navy not below the grade of captain for a period of four years, who shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet, and with the preparation and readiness of plans for its use in war: *Provided*, That if an officer of the grade of captain be appointed chief of naval operations he shall have the rank, title, and emoluments of a rear admiral while holding that position.

"During the temporary absence of the Secretary and the Assistant Secretary of the Navy the chief of naval operations shall be next in succession to act as Secretary of the Navy."

This office was organized, with Admiral Benson as first chief of operations, in June, 1915, the details and the regulations having been given very careful investigation and consideration after consultation with a number of the ablest officers in the Navy Department and in the service at large, were promulgated.

The functions and duties of the chief of operations, under the law, are covered in paragraph 126 of the Naval Regulations. These duties are thus prescribed:

"126. (1) The chief of naval operations shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet and with the preparation and readiness of plans for its use in war. (Act Mar. 3, 1915.)

"(2) This shall include the direction of the Naval War College, the Office of Naval Intelligence, the office of target practice and engineering competitions, the operations of the Radio Service and of other systems of communication, the operations of the Aeronautic Service, of mines and mining, of the naval defense districts, Naval Militia, and of the Coast Guard when operating with the Navy; the direction of all strategic and tactical matters, organization, maneuvers, target practice, drills and exercises, and of the training of the fleet for war; and the preparation, revision, and enforcement of all tactics, drill books, signal codes, and cipher codes. The orders issued by the chief of naval operations in the performance of the duties enumerated in this paragraph shall be considered as emanating from the Secretary of the Navy and shall have full force and effect as such.

"(3) The chief of naval operations shall be charged with the preparation, revision, and record of regulations for the government of the Navy, naval instructions, and general orders.

"(4) He shall advise the Secretary concerning the movements and operations of vessels of the Navy and prepare all orders issued by the Secretary in regard thereto, and shall keep the records of service of all fleets, squadrons, and ships.

"(5) He shall advise the Secretary in regard to the military features of all new ships and as to any proposed extensive alterations of a ship which will effect her military value, and all features which affect the military value of dry docks, including their location; also as to matters pertaining to fuel reservations and depots, the location of radio stations, reserves of ordnance and ammunition, fuel, stores, and other supplies of whatsoever nature, with a view to meeting effectively the demands of the fleet.

"(6) In preparing and maintaining in readiness plans for the use of the fleet in war he shall freely consult with and have the advice and assistance of the various bureaus, boards, and offices of the department, including the Marine Corps headquarters, in matters coming under their cognizance. After the approval of any given war plans by the Secretary, it shall be the duty of the Chief of Naval Operations to assign to the bureaus, boards, and offices such parts thereof as may be needed for the intelligent carrying out of their respective duties in regard to such plans.

"(7) The Chief of Naval Operations shall from time to time witness the operations of the fleet as an observer.

"(8) He shall have two principal senior assistants, officers not below the grade of captain, one as assistant for operations and the other as assistant for material.

"(9) He shall be ex officio a member of the General Board."

To assist him in this office he has 12 men of the Office of Naval Operations, 8 men in the Office of Naval Intelligence, 18 naval attachés abroad, 5 officers in target practice and engineering competition, and 10 at the War College, giving a total in the operations and at the War College of 53 officers in the Navy under his direction in carrying out the regulations and planning for war and getting information and communication.

In addition to that, while the General Board can not be said to be under his direction, because it is an organization that reports directly to the Secretary, he is a member of the General Board; and in the making of war plans, in the passing upon types of ships and every technical matter that comes under the purview of the Navy, there are 70 officers detailed for the work of operations, making plans for war, and kindred duties. Whenever there is need for additional officers for the work, they are detailed.

There seems to be an erroneous impression that under the present organization the Chief of Operations can exercise his functions only by courtesy or permission of the bureaus of the Navy Department. The functions of the Chief of Operations may be broadly divided into two general classes—those dealing with the operations of the fleet and those dealing with the preparation of plans for war. As regards the latter, he needs to utilize the bureaus of the

Navy Department; and it will be seen that the regulations give him full authority to require every bureau, board, and office of the department to furnish him with advice and assistance. It is difficult to see what more could be asked in this connection, for the organization is such that the Chief of Operations can demand the assistance he needs, regardless of personality.

I will not read all of this statement. It shows what the office has done and how it met the criticisms and the needs and responsibilities, and met them splendidly.

(The continuation of the above statement submitted by Secretary Daniels is here printed in the record, as follows:)

As regards the other broad division of his duties, the Chief of Operations has also full power and authority, and under the regulations orders issued by him have the full force and effect of orders from the Secretary of the Navy.

It is difficult to discuss in detail changes that have been proposed, because the majority of them are too definite. One suggested change, however, has been that the Chief of Operations should have a force under him to enable him to make war plans independently of the bureaus. It does not appear to be generally known that the Chief of Operations, in addition to the direct force under him—12 officers at present—has, in the officers under his direction in the Navy Department, Naval Intelligence, and Target Practice 13 other officers, and at the War College, Newport, also under his direction, 44 other officers. Under the regulations, also, he can call upon the General Board for any assistance in this matter in which it specializes. It is believed that it would be a serious mistake to organize the office of the Chief of Operations in any way with the idea that in making war plans it should be independent of the bureaus of the Navy Department. This is for two reasons:

The bureaus of the Navy Department, dealing with special subjects, are the repositories of knowledge and experience in those subjects infinitely superior to what could be obtained at any reasonable cost of personnel and effort by attempting to duplicate their knowledge and experience in the office of the Chief of Operations. It is obviously desirable that in the making of war plans these expert bureaus would be fully utilized. This is believed to be one distinct advantage of the present system.

Another essential reason why the bureaus of the department should be required to assist within their proper sphere in the preparation of war plans is that they are required to execute a material portion of the work involved, and it is essential that they should be fully advised and assist in their special fields from the inception.

A second feature of the present organization which appears to meet with some objection is that by which the Chief of Operations has charge of the operations of the fleet.

It is believed that in this respect the present organization fills a distinct need. It is not so long since the president of the War College was complaining, in substance, that the progress in the art of war made by the institution under his charge was not utilized by the fleet and that there was no system in this connection. Under the present system, with the War College and the operations of the fleet under a common head, there can be no ground for such complaint so far as the organization is concerned.

There is another condition, however, which is of prime importance in this connection. Under the system in use for a number of years past, the commander in chief had the responsibility for what may be expressed in broad terms as "the training of the fleet for war." The Atlantic Fleet, since January 1, 1906, has had six commanders in chief, each with his own staff, and each a zealous and capable officer with his ideas of what should be done, which naturally differed from the ideas of his predecessor and successor. There have recently testified before the Naval Committee the commander in chief of the Atlantic Fleet and the commander in chief of the Pacific Fleet. It is evident from their testimony that these able officers have radically different ideas, and that if they were interchanged, each, if given a free hand, would institute radical changes in his fleet.

Moreover, the department has had little or no means for judging of the efficiency of the fleet and its state of training for war, except reports of the commander in chief who was himself responsible for that upon which he was reporting. Furthermore, the Navy in its development has reached a stage

where soon we may expect to see at least two fleets, each with its own commander in chief.

Under the present system each year the ships of the battle fleet are given a standing for battle efficiency expressed by a numerical figure. It is found that in a given year this figure of efficiency for the twentieth ship, for instance, is probably only a third of that for the first ship, and that the first ship one year may stand very low the next year, and vice versa. Without attaching too much importance to numerical ratings as expressive of battle efficiency, it is evident that possibly the biggest field for improvement in the Navy today as an actual weapon of war is in bringing up the efficiency of the low ships to that of the highest ships. This requires standardized methods and the adoption and maintenance of the best according to some system possessed of continuity. It is believed that the United States Navy has now reached a growth and magnitude which requires that this work shall be directed from the department itself, and also that there should be in the department some authority upon whom the Secretary can rely and whom he can hold responsible for the training for war, not only of the Atlantic Fleet, but of all the Navy. Of course, this function must be exercised with judgment and discretion, to avoid crippling the initiative and zeal of the officers on the spot, but it is a function believed to be necessary for the best efficiency.

There have been two classes of criticism of the organization of the Navy Department which may be considered in a general way. One such was completely met by the legislation of March 4, 1915, though, as I have already indicated, this does not seem to be realized even by some officers in the Navy.

The statutes providing for the organization of the Navy Department, passed many years ago, stated that "the business of the Department of the Navy" should be distributed among certain bureaus, which should perform their duties "under the authority of the Secretary of the Navy, and their orders shall be considered as emanating from him and shall have full force and effect as such." It is difficult to see now an enormous concern such as the Navy could operate in any other way. The head of it can not attend to every detail himself. Some authority must be delegated to his immediate subordinates, and they in turn must delegate authority further down the line.

A criticism made of this system for many years was that under the organization there was no provision for what may be called, for want of a better term, the "military business" of the Navy Department. This allegation, if true, was a reflection, not upon the law, but upon the Secretary of the Navy. If the "military business" was part of the business of the department, the Secretary of the Navy should have assigned it to some bureau. As a matter of fact, for a great many years the "military business" of the Navy Department was handled by the Bureau of Navigation. At present the Chief of Operations is under the Secretary charged specifically by law with the "military business" of the department. It is evident, then, that since the institution of this office, authorized a year ago, the reproach that there was no provision for handling the "military business" of the department can no longer be warranted in any way.

There has been in the past another line of criticism of the Navy Department system which may be summarized as maintaining in the last analysis that the "military business" of the department was of such importance that officers charged with it should, under the Secretary, direct and dominate all the activities of the department, including the direction of the various bureaus and offices; in other words, should take over the complete administration of the department. This appears to be the underlying conception of many of those who demand that the Navy Department be administered by a general staff, although in foreign countries which have a staff for the navy, such as England and Germany, the staff in peace has no administrative functions and no direction of the executive organization of the department.

It is not believed that any system by which the Secretary of the Navy would be virtually a figurehead can operate satisfactorily under American institutions, which are based upon the ultimate subordination of the military to the civil.

A proposition made last year to establish under the Secretary a military officer, who should be responsible for the readiness of the Navy for war, comes under this class. That officer, having allotted to him by law responsibility which is now shared by a large number of officers of the Navy, by the Secretary of the Navy, by the President, and by Congress, could justly demand, in view of his responsibility, that as regards any matter in the Navy his

dictum should be supreme, as against every other officer of the Navy, the Secretary of the Navy, the President, and Congress itself. While this may seem improbable, it would still be a possibility, and is much more probable than many of the possible conditions alleged to be incident to the present system.

It is alleged, for instance, that at present the "military business" of the Navy Department might suffer because under the law some office or bureau might refuse to cooperate with the office charged with the "military business" of the department. There has been no such case since the present organization was instituted, and there can be no such occurrence if the present regulations governing the Navy are carried out.

The recommendation for a Chief of Naval Operations appears to have come originally from a board known as the Moody board, appointed by President Roosevelt in 1909. This board consisted of Justice Moody, formerly Secretary of the Navy; Judge Dayton, for many years a member of the Naval Committee; former Secretary of the Navy Paul Morton; and five retired rear admirals of the Navy, namely, Rear Admirals Luce, Mahan, Evans, Folger, and Cowles. This board recommended a Chief of Naval Operations in the Navy Department, who was to be the principal military adviser of the Secretary, but it specifically provided that he should have no administrative functions. The administrative functions in connection with the "military business" were to be handled by another officer. It is believed, however, that the present arrangement whereby the Chief of Operations, with the assistant for operations, covers substantially both the advisory and executive field contemplated by the Moody board, is somewhat superior to the arrangement recommended by the Moody board in this connection, while it carries out the intent of its recommendations.

There has been a suggestion, Mr. Chairman, of some change in the organization, and some gentlemen have proposed that instead of the American plan of organizing we should adopt a plan of autocratic governments. I think most of these gentlemen do not understand what the plan of the organization of the navy in England is, because the organization as you provided in your last bill is very kindred to that in Great Britain.

The statement concludes with this:

I have prepared here a very brief statement of the organization of the naval departments of Great Britain and of Germany.

I can read that now or just insert it in the record.

The CHAIRMAN. You might just put that in.

(The continuation of the statement referred to is here printed in the record, as follows:)

I have prepared here a very brief statement of the organization of the naval departments of Great Britain and of Germany, which I can read in a very few minutes, or which I can merely insert in the record, as you desire.

The CHAIRMAN. I suggest that you read it, Mr. Secretary.

Secretary DANIELS (reading):

MEMORANDA IN REGARD TO A GENERAL STAFF.

The term "general staff" is one which is loosely applied to a number of different forms of organization varying widely between themselves in character, scope, and power. In order to understand its functions in any particular case it is necessary to examine in some detail the entire administration of which it may form a part. For this purpose it is proposed to take as examples the British Navy, the German Navy, and the United States Army, in each of which there is a body partaking of the nature of a so-called "general staff," though in the first-named two services not so designated by name.

THE BRITISH ORGANIZATION.

The British Navy has for many years been administered by a board of admiralty commissioners, who exercise authority by virtue of letters patent from the Crown. The make-up of this board has varied from time to time, but at present it is constituted as follows: The first lord, the first sea lord, the second

sea lord, the third sea lord, the junior sea lord, the civil lord, and an additional civil lord. In addition to the commissioners as named above there is parliamentary or financial secretary, who is a member of Parliament and a member of the Government and a permanent secretary, who is a civilian. The commissioners exercise the powers of the office of "lord high admiral," and the letters patent from the Crown provide that any two or more of the commissioners may exercise these powers. This provision, however, is merely nominal, for by orders in council of January 14, 1869, and of March 19, 1872, there was made definite and permanent the supreme power of the first lord (a civilian), which long previous to these dates had become well established by uninterrupted usage. By these orders the first was held responsible to the Crown and to Parliament for all the business of the Admiralty, and the other members of the board were constituted his assistants in connection with such part of certain duties as might be assigned them by the first lord. It is therefore clear that both by precedent and by law the first lord, who is a member of Parliament and a member of the Government in power at any time, is in supreme and unquestioned control of the navy.

Under various assignments of duty the first sea lord is responsible to the first lord for the fighting efficiency and actual employment of the fleet. In the execution of these duties he has supervision of the mobilization of the fleet, of the intelligence, department of discipline, etc., and is the chief naval adviser in matters of maritime defense and naval strategy as influencing policy. About the end of the year 1911 or early in 1912 there was established by order of the first lord a "naval war staff," to systematize the consideration of all developments which bear upon strategy and tactics; this body is under the jurisdiction of the first sea lord. It is this body which is sometimes referred to as a "general staff," and the foregoing will serve to indicate its scope and power in relation to the naval establishment.

THE GERMAN ORGANIZATION.

The German Navy is organized in an entirely different manner and the apparent separation of the component parts of the organization depends entirely for its success on the form of the German Government itself. A brief summary of previously tried and abandoned organizations will contribute to a clearer understanding of that at present in control. For the first few years of the existence of the Prussian Navy (1848-1853) it formed a part and was under the control of the war ministry. In 1853 an independent naval board was created. In 1859 this board was split into two parts, the "Oberkommando," to discharge the function of the chief command and the "Marineverwaltung," for administrative duties. The latter was two years later developed into a naval ministry (Marineministerium), whose first head was also minister of war. Following the war of 1870 the "Oberkommando" was abolished and all functions of command and administration were assumed by an undivided admiralty under the authority of the imperial chancellor and the Emperor.

In 1889 a complete reorganization was effected; the "Oberkommando" was reestablished under the direct control of the Emperor, and this body exercised the authority of command over the fleets and the commander in chief of the home ports, who, in turn, were in charge of the military affairs of the ports as distinguished from the administrative affairs of personnel and matériel; the "Reichs-Marine-Amt" (imperial navy office) was established as an independent ministry subject to the imperial chancellor and the Emperor, and was charged with responsibility for all administrative duties. In addition there was a naval cabinet to the Emperor, which had to do with matters of promotion and appointment among officers of the higher ranks. It was soon found that the vital interrelationship between the departments made further changes essential, and thus resulted the complete reorganization of March 14, 1899, which established the present system of control of the Navy. The "Oberkommando" was once more abolished in so far as its functions of active command were concerned, but one of its sections, which had dealt with staff duties only, was retained and formed into the admiral staff of the navy (admiralstab der marine), which is still directly under the Emperor. The Reichs-Marine-Amt was retained unchanged and placed under the direct authority of the Emperor; in addition to these two bodies certain officers in positions of high command (commanders in chief of the home ports, chiefs of the high sea fleet and of the cruiser squadron, and the inspector of training) were given the first direct approach to the Emperor in matters relating to their own special functions, but in matters

under the cognizance of the Reichs-Marine-Amt they must cooperate with the navy secretary of state prior to laying the proposal before the Emperor. The Emperor also appoints direct an inspector general of the navy. The head of the Imperial German naval office (Reichs-Marine-Amt) is a naval secretary of state, and a Prussian minister of state, and as such is a member of the Bundesrath, and has the right of addressing in person the Reichstag in matters of naval finances; he is responsible for everything that relates to the matériel and personnel of the navy, and his functions can be described briefly as dealing with everything that costs money—his duties are, therefore, broadly administrative.

The "Admiralstab" is a body composed at present of 36 officers and is not concerned with administration, and in time of peace has advisory functions only; its chief is the Emperor's advisor on general policy in regard to the expansion, movements, distribution, and use of the fleet. In time of war the importance and duties of the chief of the admiralstab are generally enlarged and his power under the Emperor are practically unlimited for at such time matters of finance and administration are naturally subsidiary to the immediate necessity for victory. It is again clear in the German naval organization that the body referred to as a "general staff" is one without executive or administrative functions, except in time of war or peace it is subject to the Emperor, who is the civil head of the German government as well as commander in chief of the military and naval forces.

THE STAFF OF THE ARMY.

The General Staff of the United States Army was established by the act of Congress of February 14, 1903. By the terms of this act the General Staff Corps is composed of the Chief of Staff and 44 other officers detailed for periods of not more than four years from the Army at large, including all its branches. The authority of the Chief of Staff is under the direction of the President or of the Secretary of War under the direction of the President. The General Staff Corps has by law to do with the preparation of plans for national defense, and with all questions affecting the efficiency of the Army, in so far as the War Department is concerned. In an advisory capacity to the Chief of Staff and Secretary of War. The Chief of Staff, however, is by the law given authority over the Army at large and all the various administrative offices of the War Department. The General Staff of the War Department is organized by regulations to assist and advise the Chief of Staff in the exercise of the authority entrusted to him by law. It is, therefore, clear that in this case the General Staff is an administrative as well as an advisory body, and in this fundamental respect differs from the so-called general staff as they exist in the British and German navies.

ORGANIZATION OF THE NAVY.

The present organization of the United States Navy Department as regards staff work is closely akin to that of the British admiralty. The Chief of Naval Operations is, by the act of March 3, 1915, charged with duties approximately the same as those of the first sea lord, and his responsibility to the Secretary of the Navy is similar to that of the sea lord to the civilian first lord. Likewise the General Board of the United States Navy, created by Executive order, comes within the Division of Operations of the department and can be utilized to render to the Chief of Operations the same assistance as the naval war staff of the British Admiralty, also created by an executive order of the first lord, renders to the first sea lord in the discharge of his duties. In the case of either organization it is natural that a "naval war staff," "general board," or "general staff" should exercise such influence in time of war as to make it the predominant factor in advising the responsible executive head of the service, and at such times it would probably exercise something approaching executive functions through the agency of the Chief of Naval Operations.

It appears that the present United States naval organization is, so far as staff work is concerned, in accordance with the theory of development of the organization of the two great naval powers referred to. The outstanding conclusion which must be arrived at from a study of these organizations is that there is practical agreement on the principle that staff work can be most efficiently developed by relieving the staff of all the routine administrative

duties involved in the executive work of an organization of the magnitude of a large modern navy.

* * * * *

Secretary DANIELS. At the end of that hearing I said this, Mr. Chairman:

Secretary DANIELS. Mr. Chairman, at the close of the morning session I had about completed what I desired to say about the organization and the functions of the office of operations. I should like to add an extract from the message of the President of the United States to the House of Representatives in 1909, from Mr. Roosevelt, when he presented a report of the committee on naval reorganization, which appears in Document No. 743. He used these words: "I invite your attention to the sound and conservative character of the report."

Now listen, Mr. Chairman, to what President Roosevelt said:

"It is in full accord with American policy, for it recognizes the complete supremacy of the civil power as regards the military no less than the civil or manufacturing side of naval administration."

It is in accordance with that sound American view that we have organized the department of operations and are conducting it. I think on that line I have covered the matter as fully as I should like to take your time to do.

GIDEON WELLES OPPOSED MAKING THE SECRETARY OF THE NAVY A MERE
CLERK.

When the Navy of the United States was created in 1775, it was handled by a Marine Committee and in 1776 by what was called a Continental Navy Board, following 1779 by a Board of Admiralty.

In 1798 a Department of the Navy was created with a Secretary of the Navy, and in 1815 the general direction of affairs was placed in the hands of a Board of Navy Commissioners. This latter board which had been characterized as a debating society, continued in existence until 1842, when an organization, substantially that now in existence, was established. In other words, the business of the department was distributed amongst bureaus, each suited to a particular kind of work.

With the demands made upon the Navy Department during the Civil War, it became evident in 1862 that the creation of additional bureaus would be necessary in order to handle the increased business and the new developments, such as steam machinery, which was so extensively introduced about that time.

In 1865 an attempt was made to again appoint a board of admiralty consisting of five officers ranging in rank from vice admiral to lieutenant commander to relieve the Secretary of the Navy of his duties—that was the first Prussianizing attempt—but the proposition was defeated in Congress, the principal argument advanced against the creation of such a board being that the Secretary of the Navy could at any time convene a board of experts competent to pass judgment on any special subject upon which he desired information, whereas, under the proposed organization the board of admiralty might be composed of officers who had no particular knowledge of a subject which the Secretary might desire to have investigated.

The bureau system continued unmolested until 1869 when a new bill was introduced in Congress to create a board of survey to consist of three officers not below the grade of rear admiral, who would absorb the functions of the Secretary of the Navy and of the bureaus.

The peculiarly civil administration of the department was to give way to the military, and the position of the Secretary of the Navy to become that of a mere figurehead, who would give his approval to the decisions of the board of survey. This bill to reorganize the Navy came at the end of the administration of Secretary Gideon Welles, and it is interesting to note what that distinguished Secretary has to say on the subject. Gideon Welles says:

The House Naval Committee came unanimously to the conclusion, after patiently listening to Porter (Admiral), hearing Grimes (Senator), and understanding the wishes of Grant, that it was best to move slowly, and have therefore deferred further consideration of the bill until next December. * * * The bill among other provisions establishes a board of survey to consist of three admirals of which it is well understood Porter was to be the president. This would have placed him in the department as superior or superintendent.

It is obvious that the scheme of bringing Porter here to take charge of the Navy Department and the new Secretary also has been long since planned and is a part of Grant's military policy. * * * Borie was a passive tool. Borie was Secretary of the Navy. He is now a mere clerk to Vice Admiral Porter, not the Secretary of the Navy. This is Grant's work and purpose; the Navy is to be conducted on a military plan and system—law, usage, and system are set aside.

They are the words of Gideon Welles.

DID NOT DESIRE TO DISPLACE ADMIRAL DEWEY AND THE GENERAL BOARD.

The day after the naval appropriation act of March 3, 1915, was passed, the following statement was issued to the press in regard to the section of that law creating the Office of Chief of Naval Operations:

[Press notice, Mar. 4, 1915.]

It will be observed that in the naval appropriation act passed yesterday the clause defining the duties and position of the newly created Chief of Naval Operations differs materially from the original draft presented. "While favoring the principle, I was opposed to the provisions of the original draft," said Secretary Daniels to-day, "because it appeared to me to have the effect of abolishing the General Board, or at least of seriously curtailing its usefulness. It surely would have removed from the board's duties its chief and most important function of preparing war plans. These plans have for many years been prosecuted with diligence under the able guidance of the Admiral of the Navy, George Dewey. The result of his experience and knowledge of large problems, coupled with the labor and ability of the other officers detailed to duty on the board, could not safely be dispensed with. Needless to add that I could not be in sympathy with any measure that would minimize the value of the services of Admiral Dewey to the Navy. In the measure as finally passed it is believed the law will enable a more thorough cooperation between the department and the General Board to be effected, while retaining the leadership of Admiral Dewey in the larger naval problems. I recognize the value of his distinguished service and depend too much upon his practical judgment to be willing to minimize the work which he is doing so well."

CHIEF OF NAVAL OPERATIONS CHARGED WITH THE "OPERATIONS OF THE FLEET" AND THE "PREPARATION AND READINESS OF PLANS FOR ITS USE IN WAR."

The Office of Chief of Naval Operations was created by the following provision in the naval appropriation act of March 3, 1915:

There shall be a Chief of Naval Operations, who shall be an officer on the active list of the Navy appointed by the President, by and with the advice

and consent of the Senate, from among the officers of the line of the Navy not below the grade of captain, for a period of four years, who shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet, and with the preparation and readiness of plans for its use in war.

During the temporary absence of the Secretary and the Assistant Secretary of the Navy the Chief of Naval Operations shall be next in succession to act as Secretary of the Navy.

In accordance with the provisions of this act, I issued the following "New Navy Regulations Governing the Office of Chief of Operations":

SEC. 3. The Division of Operations of the Fleet, Article 126: 1. The Chief of Naval Operations shall, under the direction of the Secretary of the Navy, be charged with the operations of the fleet and with the preparation and readiness of plans for its use in war. (Act of Mar. 3, 1915.)

2. This shall include the direction of the Naval War College, the Office of Naval Intelligence, the Office of Target Practice, and Engineering Competitions; the operation of the Radio Service and of other systems of communication, of the naval defense districts, and of the Coast Guard when operating with the Navy; the direction of all strategic and tactical matters, organizations, maneuvers, target practice, drills, and exercises, and of the training of the fleet for war, and the preparation, revision, and enforcement of all tactics, drill books, signal codes, and cipher codes. The orders issued by the Chief of Naval Operations in the performance of the duties enumerated in this paragraph shall be considered as emanating from the Secretary of the Navy and shall have full force and effect as such.

3. The Chief of Naval Operations shall be charged with the preparation, revision, and record of regulations for the government of the Navy, naval instructions, and general orders.

4. He shall advise the Secretary concerning the movements and operations of vessels of the Navy and prepare all orders issued by the Secretary in regard thereto, and shall keep the records of service of all fleets, squadrons, and ships.

5. He shall advise the Secretary in regard to the military features of all new ships and as to any proposed extensive alterations of a ship which will affect her military value, and all features which affect the military value of dry docks, including their location; also as to matters pertaining to fuel reservations and depots, the location of radio stations, reserves of ordnance and ammunition, fuel, stores, and other supplies of whatsoever nature, with a view to meeting effectively the demands of the fleet.

6. In preparing and maintaining in readiness plans for the use of the fleet in war, he shall freely consult with and have the advice and assistance of the various bureaus, boards, and officers of the department, including the Marine Corps Headquarters, in matters coming under their cognizance. After the approval of any given war plans by the Secretary, it shall be the duty of the Chief of Naval Operations to assign to the bureaus, boards, and offices such parts thereof as may be needed for the intelligent carrying out of their respective duties in regard to such plans.

7. The Chief of Naval Operations shall from time to time witness the operations of the fleet as an observer.

8. He shall have as senior assistant an officer not below the grade of captain.

9. He shall ex officio be a member of the General Board.

10. During the temporary absence of the Secretary and the Assistant Secretary of the Navy, the Chief of Naval Operations shall be next in succession to act as Secretary of the Navy. (Act of Mar. 3, 1915.)

GRANT PUT IN CHARGE OF SUBMARINES IN ATTEMPT TO REMEDY DEFECTS AND INCREASE EFFICIENCY.

In 1915 we were having troubles with the submarines we had inherited from previous administrations, and in May I determined to take radical measures to put the entire submarine force in better condition. Far from attempting to conceal their shortcomings, I announced that the "showing made by the submarines in the recent maneuvers" strengthened my determination to "begin at once a

thorough investigation to actually determine the cause and, if possible, to find a remedy for the too frequent breakdowns of submarines"; and on May 27, 1915, I issued the following public statement:

I am introducing this, Mr. Chairman, because Admiral Grant has been before your committee and made certain statements about the submarines, and I wish to show that the Secretary of the Navy early in 1915 recognized the troubles with the submarine, and in order to remedy them appointed Admiral Grant in full charge of submarines. I issued the following public statement:

With the growing importance of the submarine as an instrument of warfare, I feel that too much attention can not be paid to this branch of the service and every effort of the department will be directed to improving the records made by submarines during the recent maneuvers. The submarine is still in an experimental stage and the boat of two years ago, as compared with those now in active service abroad, is probably even more comparatively obsolete than an automobile of three years ago would be to-day, as the improvement in the design and building of submarines, here as well as abroad, has been even more rapid than in the case of motor vehicles.

Of the 12 submarines which came to New York for the maneuvers, one was unable to proceed, and various others suffered from breakdowns necessitating repairs of greater or less importance which took them out of the game for varying lengths of time. The full reports are not in, and it is impossible to name which boats were out of commission from serious causes and which had merely the usual trivial defects which must be expected at any time and which can be remedied without any serious delay or impairment of their efficiency. Reports, unofficial, give a number varying from five to seven as the total submarines effective during a certain period of the maneuvers.

The machinery of a submarine is very delicate. There is, first of all, the propelling machinery for surface work, which is subject to all the faults of an automobile engine and can have all of its various diseases. There are, in addition, the storage batteries which do not anywhere near approach perfection as yet and which are continually giving trouble in their use. Then there are the motors used to drive the boat when under water, which, like all electrical machinery, are delicate and subject to sudden breakdowns. The failure of any one of these three elements mean the putting of the boat out of commission until repairs are made, and it can thus be easily seen that a much higher percentage of breakdowns must be expected than in other boats. The battery trouble, as already announced, we hope to have eliminated in our newer boats if the Edison battery lives up to its preliminary tests. The other troubles are being eliminated with each new design as the defects of the old designs become apparent. What I am most interested in is in finding out whether these breakdowns were such as must be expected in more or less experimental boats or whether they were due to faults of construction that should have been remedied or to defects in our system of reporting and making repairs. It is my intention to immediately investigate this matter and to spare no effort to remedy anything which is possible of being remedied. I have had this intention for some time, but have waited in this matter for the results of the actual tests under war conditions before making any announcement, as I considered that was the best proof as to whether or not these boats were capable of sustained service. In some cases the breakdowns are probably due to imperfect design owing to the lack of data at the time at which the boats were built. This would be particularly true of the *E-1* and *E-2*, which have been mentioned as breaking down, as they were the first boats built after the change from gasoline to heavy oil engines. One of the *K* boats appears to have been in trouble also but none of this class has been finally accepted by the department as being satisfactory, having had their preliminary tests, but the builders still being responsible for their effective performance.

In the meanwhile the plans for the 26 new submarines authorized by the Sixty-third Congress are being pushed with all possible speed, and I am greatly pleased with the rapid and efficient work of the Bureaus of Construction and Repair and Steam Engineer in this matter. Bids will be invited for their actual construction next week. These boats include two more of the new sea-going submarines, which we are going to try to make the last word in such craft. It must not be forgotten that all of the submarines which have been

in trouble recently were designed before 1912. The newer boats, both nearing completion and about to be begun, are believed to be vast improvements upon the old models, and it is thought that the greater part of previous weaknesses have been eliminated.

On May 28 I selected Admiral Grant to take charge of the entire submarine service, stating that he would be—

Given large powers in construction work of and the development of the submarine flotilla and its organization, so as to bring it up to the maximum state of efficiency.

ADVISORY COUNCIL CREATED IN JUNE, 1915.

To improve the organization of the Navy Department and bring all the chiefs of bureaus in closer touch with each other, the Chief of Naval Operations and myself, in June, 1915, I created the "Secretary's Advisory Council." In explaining the reasons for the creation of this council I stated, on June 24:

NAVY DEPARTMENT,

June 24, 1915.

Following the appointment of Rear Admiral Benson as Chief of Naval Operations, Secretary Daniels has assigned two captains as principal assistants in this new office, one to be known as Assistant of Operations, and one Assistant for Material. Capt. Volney Chase was a short time ago designated as Assistant of Operations, and yesterday Secretary Daniels assigned Capt. Josiah S. McKean as Assistant for Material. He will enter upon this detail August 1.

I would like to insert here, Mr. Chairman, a word of appreciation to Capt. Volney Chase. He was the First Assistant of the Chief of Operations; a singularly able, devoted, and wise officer. A finer gentleman I never knew; and he gave his life for his country just as truly in the office of the Chief of Operations by his working overtime and by the tremendous efforts he put forth in the early days of the war—he left the office one night and was dead the next morning—as if he had died on the field of battle in the early days of the war. From the time we broke off relations with Germany, in February, up to his death in July, he was rarely away from the office, day or night, and in those days which have been called in question, from February to July, Volney Chase did a service for his country not surpassed by any officer that the Navy has had. And I wish to add this: We have named a destroyer *Chase*, in his honor. It is very regrettable that this great officer, conscientious and efficient, through whose hands passed most of the important measures from the time we broke off relations until his death, about the 1st of July—I will get the exact date—should not be here to tell you and to tell the world in detailed and accurate way, which characterized him, the great work that the Navy Department did in those tense and straining days, days during which he served so faithfully and laid down his life preparing what other men reaped. [Continuing reading:]

The act creating the position of Chief of Naval Operations provided that he "shall, under the direction of the Secretary of the Navy, be charged with the operation of the fleet, and with the preparation and readiness of plans for its use in war." In order that the highest efficiency of the position may be secured, Secretary Daniels, after consultation with some of the ablest officers of the Navy, has decided that those duties necessary in material in the way of keeping the fleet always prepared for war heretofore performed by

the aid for Material, shall devolve upon the Chief of Operations. This plan will enable Admiral Benson to keep in touch with the actual material condition of the fleet, as well as its operation. In accordance with this policy, therefore, no aid for Material will be named to succeed Admiral A. G. Winterhalter, who will in a few days relieve Admiral Cowles as admiral of the Asiatic Fleet. It is believed this organization will secure such direct communication and cooperation between the chiefs of the bureaus and the Chief of Operations as will make for the highest efficiency of the fleet. Under it there will be no longer separation of the matériel preparation of the fleet from its operation, for under the Secretary, the Chief of Operations will have all the knowledge about matériel as well as how to utilize it quickly to the best advantage.

The organization of the aids system is, therefore, discontinued. Instead of a council of aids, made up of officers selected especially to compose what has been known as the "Secretary's Advisory Council," that council will be composed of: Assistant Secretary of the Navy, Franklin D. Roosevelt; Rear Admiral W. S. Benson, Chief of Naval Operations; Rear Admiral Victor Blue, Chief of the Bureau of Navigation; Rear Admiral Joseph Strauss, Chief of the Bureau of Ordnance; Rear Admiral W. S. Griffin, Chief of the Bureau of Steam Engineering; Rear Admiral D. W. Taylor, Chief of the Bureau of Construction and Repair; Rear Admiral H. R. Stanford, Chief of the Bureau of Yards and Docks; Rear Admiral Samuel McGowan, Chief of the Bureau of Supplies and Accounts; Rear Admiral W. C. Braisted, Chief of the Bureau of Medicine and Surgery; Maj. Gen. George Barnett, Commandant of the Marine Corps; Capt. Ridley McLean, Judge Advocate General of the Navy.

The composition of this council, it will be seen, is made up exclusively of officers whose positions are created by act of Congress. I wish to emphasize that, because I think, gentlemen, in all the organization and development of the Navy authority ought to be given—I mean, we ought to conduct the department through the administration of officers whose appointment is authorized by Congress, and that their responsibilities ought not to be minimized or transferred to anybody, because they are responsible to Congress. That is to say, the Chief of Ordnance has his appropriations which he spends, under the Secretary. The Chief of the Bureau of Steam Engineering and the Chief of the Bureau of Construction and Repair and the Chief of the Bureau of Yards and Docks and the Chief of the Bureau of Supplies and Accounts and the Commandant of the Marine Corps and the Judge Advocate General, and it would be the greatest mistake on earth to place all those officers under the Chief of Operations. He ought to have the closest touch with them and the closest cooperation, but it would be a mistake to make them mere clerks to the Chief of Operations, even if you could find a Chief of Operations who was a superman, and we have not found any such yet. [Continuing reading:]

The composition of this council, it will be seen, is made up exclusively of officers whose positions are created by act of Congress, charged with certain statutory duties, all of whom are appointed by the President and confirmed by the Senate. It will meet with the Secretary every Thursday and at such other times as may be necessary.

"I do not believe," said Secretary Daniels, "that in all its history, taken as a whole, the bureau chiefs were so universally recognized as masters of the professional work under their special direction as now."

By constituting an advisory council of statutory officers of the Navy Department who are responsible to Congress, the Secretary believes he will secure better results than under the system of aids. As a matter of fact, he has given more thought to the selection of the men who will form this council than to any other one thing, and he is confident that these weekly, and, when necessary, more frequent, meetings will secure the best cooperation in the work of the department.

"I have learned to rely upon the men who will compose this council," said Secretary Daniels. "The bureau chiefs touch at first hand every unit (matériel, operation, personnel) of the Navy, and I have had almost daily conferences with them about the big problems in their bureaus. Of course, these will continue, but in addition, the new plan will give at least formal weekly meetings for common council and interchange of views."

We have heard much, Mr. Chairman, about the failure of the department to make preparations in the years 1914 and 1915; much that was not so; much that were mistakes; much from misinformation; much from lack of information—most of it the last—so that I wish to give you what was done by Congress and by the Navy Department in those days when they have said that the Navy Department was not preparing for the great event.

IMPORTANT FEATURES OF NAVAL APPROPRIATION ACT OF MARCH 3, 1915.

Upon the passage of the naval appropriation act of March 3, 1915 (which made provision for the fiscal year 1916, which began July 1, 1915), I made the following statement:

The naval appropriation bill for 1916 is the most liberal measure for the increase and support of the Navy, carrying more valuable legislation than any naval appropriation bill ever enacted by Congress. The wisdom of the present Congress, is shown particularly in its resistance to attempts to discredit the Navy's matériel and personnel; in its adherence to the fundamental types of fighting vessels—battleships, destroyers, and submarines; in its recognition of aircraft and submarines as important auxiliaries of warfare, and of the latter's increased efficiency; in its creation of a naval reserve; in the establishment of the Office of Chief of Naval Operations and the ranks of admiral and vice admiral; in the abolition of the plucking board; in equipping navy yards for the construction of ships and the increase in the manufacture of munitions of war; in well-considered and liberal appropriations for the needs of the service in every line.

The Sixty-third Congress has been more generous than any other in providing for the Navy, having authorized in the two naval appropriation bills an entire division of five dreadnaughts which will each cost in the neighborhood of \$15,000,000, three sea-going submarines, which will cost \$1,500,000 each; 23 submarines, which will cost about \$500,000 each; 12 torpedo-boat destroyers, averaging in cost about \$900,000 each; and a fuel ship, to cost \$1,000,000.

The total appropriation for increase of the Navy authorized by the Sixty-third Congress is \$86,145,535, showing an increase over the Sixty-second Congress by the Sixty-third Congress of \$30,250,466.52 for additional ships for the Navy. To this should be added \$1,000,000 for aviation and \$800,000 for submarines reappropriated from savings effected in expenditures ashore over the last fiscal year. This \$1,800,000 of money reappropriated by reason of economies effected should be added to the \$86,145,531, making \$87,945,531 for new construction.

The real progress that will be made by the Navy as a result of its liberal and intelligent treatment by this Congress can not be expressed by dollars and cents. Any person or any Congress can spend money, but no other Congress has gone so far to see that its appropriation was applied where most vitally needed and without regard to merely political considerations. Everything has been subordinated to the battle fleet and its efficiency. The haphazard and sometimes prodigal appropriations of previous Congresses for unnecessarily costly buildings at navy yards, which has been so justly criticized by former Secretary of the Navy Meyer in the public press, has been done away with. Expenditures ashore have been reduced to an absolute minimum, and in this connection it is pleasant to record the cheerful cooperation of Members of Congress from navy-yard districts, who have patriotically risen to the occasion and cheerfully acquiesced in the desire of the department to, first of all, increase the strength and efficiency of the fleet. Of perhaps even greater eventual importance than the mere physical additions to the fleet are the steps which have been taken toward increasing the personnel and modernizing the military organization of the Navy. The "plucking board," which had outlived its usefulness, has been abolished, and a system of promotion to take its place will be one of the first things taken up by the new Congress when it assembles.

COMPARISON OF ESTIMATES AND APPROPRIATIONS.

A comparison of the provisions of the bill with the recommendations in the annual report of the Secretary of the Navy for the fiscal year 1914, and the accompanying estimates for the fiscal year 1915-16, shows how closely Congress followed the thought and reasoning of this report. The building program recommended by the Secretary was: Two dreadnaughts; six destroyers; eight submarines or more, one to be of seagoing, and seven or more of coast-defense type (with a supplementary recommendation for a larger increase in submarine craft "appropriating generously therefor without reducing the appropriation for other classes," and \$1,000,000 for aviation); one gunboat; one oiler.

The building program passed by Congress is as follows: Two dreadnaughts, 6 destroyers, 2 seagoing submarines, 16 smaller submarines, 1 oiler, \$1,000,000 for aviation.

Perhaps the best piece of legislation for the Navy passed in a decade is the provisions in the present bill authorizing a naval reserve. It creates a naval reserve composed of only honorably discharged men from the Navy, on graded pay according to the length of time they have served. This not only provides a reserve of trained and experienced men, ready upon a day's notice to man our reserve ships and to supplement the war complements of ships of the battle fleet, but perhaps its most important feature is that which permits men to enter the reserve on graded rates of pay according to the length of service in the Navy. This feature will greatly increase the efficiency of the enlisted personnel by inducing the experienced men to remain in the service for longer periods and thus cause the bulk of the enlisted personnel to be composed of trained and experienced men. Under the conditions of to-day, only one-third of the entire enlisted force of the Navy are men who have had more than four years service. The other two-thirds are now serving in their first enlistment. This has been the case for many years. It is believed that this feature of the bill will place our enlisted force on a better status than that of any other Navy in the world.

The bill provides for a new position in the Navy, to be known as the Chief of Operations, who, under the direction of the Secretary of the Navy, will be in charge of the operations of the fleet and preparation of plans for its use in war. This new position, it is believed will coordinate more perfectly the work of the War College, the General Board, the Office of Naval Intelligence, and the carrying out of maneuvers by the fleet.

You will observe, Mr. Chairman, it says, "will coordinate more perfectly the work of the War College, the General Board, the Office of Naval Intelligence, and the carrying out of maneuvers by the fleet."

Never a suggestion there that it must supersede the working bureaus and take upon itself the work that the Congress imposed upon them.

The wisest men in the Navy believe this provision will make the organization as perfect as it is possible to make any organization, and will centralize in the Navy Department all the utilities which go to make for the preparation for war.

Admirals and vice admirals.—For a long time it has been felt whenever there were any joint operations between the navies of this country and of other countries that the American Navy had not had the position to which it is entitled because other countries, some of them with much smaller navies, have given higher rank to the commanding officer. We have now in the American Navy in command of fleets no admiral. The only admiral we have is Admiral Dewey, who is at the head of the General Board and does not go to sea. The conference committee has agreed upon a provision which will remove this handicap under which our Navy has been compelled to operate. It is provided that the commander in chief of the fleet on the Atlantic, Pacific, and Asiatic waters shall rank as admirals and vice admirals. This rank is not created to be conferred upon any officer permanently, but he occupies it only so long as he is in command afloat. The American fleet has become so large that the officers who direct it are entitled to the highest rank given to officers of any Navy in the world.

Plucking board.—The conferees, following what was the clear direction of Congress in both branches, has abolished the plucking board. It is advertent to

the necessity of some legislation to permit officers to be promoted to the highest grades before they are old men. But there has been such a difference of opinion as to exactly what provisions would accomplish this with justice to the officers and the country that the conferees have decided to omit the substitution of something in the place of the plucking board until the next Congress, when the needs of the personnel will be taken up.

Pay clerks.—The position of pay clerks in the Navy has up to this time been a most unsatisfactory one. Every paymaster, upon being detailed to a ship, was allowed to appoint his own clerk, and upon his detachment the appointment of the clerk was automatically revoked. This gave no permanent status to the pay clerks, and caused a great deal of confusion in the changing of duties of paymasters. The measure providing for a permanent corps of pay clerks is an excellent one for the general duties to be performed; and it at the same time gives an opportunity to the clerical force of the enlisted personnel to receive advancement. This provision, therefore, will promote the efficiency of the corps having charge of supplying the Navy in peace and war.

Naval constructors.—The steady increase of the building program and the constant developments in naval architecture call for more naval constructors, and the Secretary of the Navy is given authority to transfer an additional number of ensigns to the Naval Construction Corps, not exceeding 5 in any one calendar year, up to a total not exceeding 24. The necessity for this has been heightened by reason of the changed methods of construction that will be learned as the result of the present European war.

Medals.—Heretofore there has been a provision of law by which an enlisted man who showed distinguished conduct in battle or extraordinary heroism can be given a medal of honor, but there has been no such provision for an officer. The bill provides that the President may give such medal of honor to an officer who deserves it.

Radio.—The development that has been made in radio during the last year has demonstrated the great value that the service can render in war, and its prime importance as a means of communication. Communication is now readily had between the radio station at Arlington and the small radio station at San Diego, and the erection of the high-powered stations at San Diego, Pearl Harbor, and Cavite will, it is believed, insure communication between the department and the Government's most distant possessions at all times of the day and at all seasons of the year.

Marine barracks.—The Sixty-first Congress appropriated \$400,000 for the construction of marine barracks in Panama. In view of the fact that the forces of the Army will occupy the Canal Zone, the Secretary of the Navy did not authorize the construction of the barracks provided for at Panama, and this bill authorizes the use of the \$400,000 appropriated at Panama to be spent, \$200,000 each for barracks at Mare Island and Norfolk.

Shipbuilding at navy yards.—Until a year ago none of our navy yards were prepared to build ships except New York and Mare Island. The naval bill passed at the first session of this Congress carried an appropriation for a building slip that would enable Boston and Philadelphia to build ships for the Navy. The present bill carries an appropriation to enable Norfolk and Charleston to construct ships in these yards, and during the year the Secretary has arranged to build submarines at the Portsmouth (N. H.) yard. It is believed that if all the navy yards are equipped to do construction of some character the investment in the yards will yield a better return, and that the competition between the yards and the private contractors would insure that the Government will secure the construction of new ships at the lowest possible price.

The investment of money we made then, Mr. Chairman, in equipping navy yards to build ships and larger facilities for repairing them, paid for themselves ten times over during the war. [Continues reading:]

During the last year the Secretary of the Navy has established an aviation school at Pensacola, utilizing the grounds and buildings which had been abandoned when the Pensacola Navy Yard was abolished. For the first time in the history of the Navy aircraft were used abroad during the occupation of Vera Cruz, and the Navy aviators were able to render valuable service. The war in Europe has shown the great importance of aircraft. The conference report makes a new departure in aeronautics in the Navy and appropriates \$1,000,000 for the development of aeronautics and the purchase of modern aircraft. Here-

tofore the appropriations for aeronautics have been divided among the several bureaus. It is now concentrated, and with the school at Pensacola and the larger appropriations Navy aeronautics will become a much more effective agency.

In addition, the bill provides for an advisory committee for aeronautics. It is believed that this advisory committee, with the authority given, composed of officers of the Army and Navy and men skilled in aeronautical engineering and its allied sciences, will bring together the aeronautic services of the Government and give to each branch the valued results of study and investigation.

The aeronautic service is particularly hazardous and calls for men of enterprise and daring. The bill provides proper compensation for the courageous men who undertake this dangerous service for the Navy and permits the Secretary of the Navy to assign to this service officers of higher rank than have heretofore been available.

The conferees have voiced public sentiment in favoring a large increase in the fighting power of the Navy and limited new construction to ships deemed the most effective in time of war. The European conflict has demonstrated the use of submarines with a speed of 25 knots, or more if possible, but not less than 20 knots each, to cost not to exceed \$1,500,000 each. The first session of this Congress authorized the first submarine of this character which had theretofore been authorized. Up to the present war the largest submarine had been of 800 tons displacement. These three seagoing submarines will have a displacement of not less than 1,100 tons and as far as is reliably known are the largest projected by any country. Provision is also made for the construction of 16 more submarines, to cost not to exceed \$550,000 each. Six destroyers are authorized, to cost not to exceed \$925,000 each, and one officer, to cost not to exceed \$1,100,000. The regular program of two dreadnoughts a year, originally recommended by the General Board, is carried out in this bill. These mighty ships, exclusive of armor and armament, will cost not to exceed \$7,800,000 each.

It is estimated that fully equipped they will each cost between fourteen and fifteen million dollars. The first session of the present Congress authorized three dreadnoughts, thus making the record of the Sixty-third Congress five of these most powerful fighting ships.

The total appropriations carried by this bill reported by the conferees is \$147,538,981.88, of which \$45,053,801 is for increase of the Navy, exclusive of \$1,000,000 for aeronautics, which should be added, making \$46,053,801 for increase of the Navy in this bill. If to the new construction carried in this bill is added the amount for new construction authorized at the last session of this Congress, which was \$41,091,734, it will be seen that the increase of the Navy authorized by the Sixty-third Congress is \$87,145,535, which is \$31,250,466.52 more than was carried in the appropriation bills of the Sixty-second Congress for increase of the Navy. The total appropriations for the Navy in this bill is \$147,538,981.88. It should be borne in mind, however, that the last session of this Congress authorized the sale of the *Idaho* and *Mississippi* for \$12,535,275.96 and the construction of the powerful dreadnaught *California*. Therefore, the total naval appropriation in said bill should be reduced \$4,635,000, the amount authorized for the construction of the *California* by last session out of the proceeds of the sale of the *Mississippi* and *Idaho*, and the total naval expenditures of the present session of this Congress should be reduced \$5,827,410, the sum to be expended on the *California*. These amounts came from the proceeds of the sale of the *Idaho* and *Mississippi*, and therefore do not come out of the regular funds in the Treasury derived from taxation.

As I said before, the committee has heard many statements of the lack of preparation of the Navy in 1914 and 1915, and in the early part of 1915 there was some criticism.

STATE OF THE NAVY IN 1915 SET FORTH IN A LETTER TO DR. GARFIELD.

On April 26, 1915, in response to a letter from Dr. Harry A. Garfield, president of Williams College, asking for a detailed statement of the state of the Navy at that time, I wrote the following letter:

WASHINGTON, D. C., April 24, 1915.

MY DEAR PRESIDENT GARFIELD: I am in receipt of your recent favor asking for "an authoritative statement concerning the present status of the Navy equip-

ment of the United States," and take pleasure in complying with your request as far as is compatible.

There are now in active service, fully commissioned, 225 vessels of all characters, which is 36 more than were fully commissioned when I became Secretary. There are also 101 vessels of various types, in reserve and in ordinary and un-commissioned, capable of rendering service in war. We have under construction and authorized 77 vessels (9 dreadnaughts, 23 destroyers, 38 submarines, and 7 auxiliaries) as compared with 54 vessels (5 dreadnaughts, 14 destroyers, 23 submarines, 3 gunboats, and 9 auxiliaries), which were under construction on March 1, 1915.

All the vessels enumerated, those in active service and those in reserve, are supplied with munitions of war. No Navy makes public the quantity of ammunition and torpedoes, mines, and other implements of naval warfare which it keeps ready. It may be said, however, that within the last two years the quantity of all has been steadily and greatly increased.

Now, this is what was increased in 1913 and 1915:

For example, we have increased the number of mines, on hand and in process of manufacture, by 244 per cent. With reference to torpedoes, the increase in two years has been 90 per cent. By the enlargement of the naval powder factory, we shall soon be able almost to double the former capacity, and like enlargement of the torpedo works and the equipment of a plant to construct mines will still further increase, at decreased cost, the quantity of such stock; and the possession of these plants in time of emergency will enable the department to be in a better state of preparedness as regards the supply of ammunition than ever before.

The personnel of the Navy is at present composed of 4,355 line, staff, and warrant officers and 53,171 enlisted men. Increases in the number of officers is dependent almost entirely upon the output of the Naval Academy, admission to which is restricted by statute. The number of enlisted men also is restricted, and the Navy is to-day recruited to the maximum strength allowed. There are now with the colors 5,824 more men—an increase of 12 per cent—than there were on March 1, 1914.

My professional training as a journalist has always inclined me to the conviction that any officer, within the prescribed limit recognized in the Navy, should feel free to express his opinion in regard to matters in the service; and there is not an officer who commands a ship to-day who could or would say that his ship, without or within, was not as good as it was two years ago, or that the officers who command it and the crews who man it are not as thoroughly disciplined, sober, loyal, and efficient as they were two years ago or as they ever had been.

The Atlantic Fleet has just returned from Guantanamo, where it has for many years held its annual winter practices. This year more battleships and destroyers have participated in the maneuvers, and for a longer period, than ever before.

Under the direction of Admiral Fletcher, upon plans evolved at the Naval War College and approved by the department, the fleet has been busied in tactics to try out its efficiency and readiness. All reports tell of the enthusiasm of officers and men in this practice and the splendid record made by the ships. The fleet is now in Tangier Sound and on the southern drill grounds, where it will be busy in target practice until May, when it moves to New York for a week's well-earned leave. Then will come the review at New York, followed by maneuvers in Narragansett Bay region, and finally the review in Hampton Roads prior to sailing through the Panama Canal to the Pacific en route to the exposition at San Francisco.

These spring practices followed close upon the heels of valuable maneuvers and tactics in October, November, and December last. This was indeed strenuous practice, but it is the way the Navy is kept fit and ready; and the new admiral in command of the fleet and the department planned such extensive evolutions because the only way that the Navy can be always prepared is by practice, and practice, and then more practice. This simple statement of the operations of the fleet since October is one of the best answers I can give to your question as to the Navy's preparedness. The necessity of keeping ships in Mexico last year denied Admiral Badger the opportunity for as long practice as he had wisely planned, but the sudden call for the expedition to Vera Cruz demanded and exacted unusual service, to which the fleet responded with an alacrity and readiness which amply justify the faith of the country that there

exists to-day no more efficient institution than the United States Navy. Some critics have said the efficiency of the fleet was reduced by reason of going to Vera Cruz. To our regret, certain maneuvers and target practice of value were necessarily omitted. The emergency experience, however, of a year of stress and strain was of far greater value in one important respect than the well-planned routine, because it gave a demonstration of the readiness of the Navy in every department, afloat and ashore, to meet an urgent call. Its flexibility was shown in adjusting itself to entirely new and unexpected situations as well as its remarkable adaptability in handling every problem presented to it.

It must be conceded by all that the best school and preparation for war is war itself, and it was almost under this condition that our fleet acted in proceeding almost in a day to Mexican waters. The stay at Vera Cruz, however, did not prevent practice, for the ships individually or in divisions during a great part of the time held tactical maneuvers, torpedo-proving practice, and subcaliber drills in preparation for target practice.

For many years officers have written and talked about the formation of advance-base material and the practice of exercising landing parties of seamen and marines in the use of this important adjunct to naval warfare. Congress appropriated money for this important plan of campaign, but never until January of last year was the Navy thus exercised. There had been plenty of talk, but not until January of last year was it undertaken. Then, under instructions from the department, Admiral Badger carried out a comprehensive exercise in which the professional advantages gained by officers and men were inestimable. Three months after this extensive practice had been given for the first time in our Navy the same fleet and the same men were called upon to land at Vera Cruz, and in the taking of that city the Navy carried out under fire what had been learned at Culebra.

These details are given because every man knows that the efficiency of the Navy depends upon constant practice, but nobody in the Navy thinks anything like perfection has been reached, and constant study and work are pursued with the aim of continued improvement. If the fleet was efficient in any degree before Admirals Badger and Fletcher carried out the drills thus detailed, it is much more efficient to-day, and it will be made more ready every year. All that capable and trained officers and men can do to accomplish this steady improvement is being done. Only the uninformed or the partisan deny the steady improvement of the past two years, thanks chiefly to Rear Admiral Badger and Admiral Fletcher.

But, you say, how about equipment and preparation for military emergencies? What has been done since Wilson's inauguration to make the Navy stronger in ships, in ammunition, in mines, in torpedoes? These questions are of the utmost importance. Let me answer them briefly:

First, as to ships: During the last two years of the Taft administration Congress authorized the construction of two dreadnaughts to cost about \$13,000,000 each. During the first two years of the Wilson administration, upon my recommendation, Congress authorized the construction of five dreadnaughts to cost about \$14,000,000 each. Stated in dollars, the Wilson administration, in its first two years, authorized \$70,000,000 to be spent on the chief fighting force of the Navy, as against \$26,000,000 authorized during the last two years of Taft's; stated in numbers, it authorized five dreadnaughts instead of two; and stated in effectiveness, the five dreadnaughts authorized under Wilson will mount 36 more 14-inch guns than the two authorized under Mr. Taft.

Second, as to submarines: These wonderful agencies of war have astonished the world in the present European conflict. The Sixty-third Congress, elected with Wilson, adopted my recommendation to give us all the money it could for submarines.

That was my recommendation. "to give us all the money you can for submarines."

It ordered the construction of three seagoing submarines, the largest ever authorized by any country, and 23 submarines of the same size and type which have done such fearful execution in the present war. These submarines will cost \$16,260,000. Now, what was done during the last two years under Taft?

Twelve submarines to cost \$7,958,936 were authorized. Some of our submarines are not as perfect as they could be, nor are the submarines of any other nation. Under this administration, however, the board of inspections has adopted stricter tests before accepting submarines from contractors. Nobody has, as yet, perfected a satisfactory engine or satisfactory battery for subma-

rines. Upon my invitation, Mr. Edison, last year, at the New York Navy Yard, went down into a submarine and closely studied its every feature. He thinks he has a battery that will meet the need. Our tests at the Brooklyn Navy Yard cause us to believe Mr. Edison has the right principle. Without waiting for the completion of his battery, he has been given an order for two, one to be put into an old submarine, accepted before March 4, 1913, whose battery does not give satisfaction, and one for a new submarine which I have ordered built in the Portsmouth (N. H.) Navy Yard. Private firms building submarines have not given entire satisfaction. We have equipped the Portsmouth Navy Yard to build submarines, and by competition between private and Government construction it is hoped that every obstacle may be overcome.

Third, as to torpedoes: A statement has been put in circulation that the Navy is not making adequate provision to supply itself with torpedoes. The only answer I can make is to state the fact that we either have on hand or have placed orders for all the torpedoes the General Board prescribes. Is this administration going backward in this respect? It would not be proper to make public the number of torpedoes we have on hand, but this much may be said: For every 100 torpedoes which the department had on hand in March, 1913, 96 more are completed or in course of manufacture. Therefore, within a few months, the supply of torpedoes will be almost doubled. Upon my recommendation Congress has enlarged the torpedo plant at Newport, R. I., more than trebling its capacity, and the cost of manufacturing torpedoes has been reduced from \$4,202.11 to \$3,245.72 each. The reduction has already effected a saving of \$326,700.

AS TO MINES AND MINING.

During the last two years unprecedented progress has been made in the expansion of our mining equipment. This was begun and was well under way before the last Congress met. The Navy is not, as many suppose, charged with the mining of our harbors. That is a function of the Army. The extent of the mining operations of the Navy is confined to the immediate vicinity of the fleets and such mining as may be necessary on the high seas. For the execution of this work and a further study and development of mines and mining the Navy now has three ships—the *San Francisco* and *Baltimore*, mine layers and mine depot ships, and the *Dubuque*, mine-training ship. The General Board as early as 1908 recognized the need of mine depot vessels and recommended the conversion of two old cruisers for this purpose.

The same year Congress authorized the conversion of the *San Francisco* and *Baltimore*. Work was started on the *San Francisco* June 12, 1908, but was not completed until December 2, 1911. Work on the *Baltimore* was not started until April 5, 1913, and was completed April 1, 1915. As to mine sweepers a division of seagoing tugs and a division of torpedo boats have recently been equipped with mine-sweeping gear, and the destroyer tender carries mine-sweeping gear for a division of destroyers operating with the fleet. Additional gear is being supplied. At Pensacola during the winter the *San Francisco* and submarine flotilla have been operating jointly in mining exercises. The department has begun the manufacture of mines and in a short time will have 31 mines for every 9 it had two years ago, increasing our stock 244 per cent. By manufacturing mines at a Government station in lieu of purchasing them a saving of \$178,750 has been effected.

AS TO GUNS.

The Bureau of Ordnance has developed a 14-inch gun that will shoot farther, shoot straighter, and hit harder than any gun now in use or known to be designed in a foreign country. Based upon former and current prices in contracts for guns and gun forgings we have saved \$280,425.33.

AS TO POWDER.

Upon my recommendation Congress increased the capacity of the Navy powder factory at Indianhead. When the extension, now under way, is complete, the capacity will be nearly doubled. The cost of manufacture has incidentally been reduced 2.7 cents per pound, saving already in the cost of powder manufactured \$150,000.

AS TO RADIO.

Radio has at last been successfully installed on submarines, and more than 75 other ships, which either had no radio or whose equipment was obsolete, have been supplied with modern equipment. Three entirely new shore stations have been added to the chain—Balboa (Canal Zone), Great Lakes, Ill., and Tutuila, Samoa.

AS TO AIRCRAFT.

The European war has emphasized the value of aircraft. The Navy has lagged behind in this instrument of war. Last year I appointed a board of aviation. It recommended the utilization of the abandoned navy yard at Pensacola as a training and repair station for aviation, and an Aviation Bureau in the department. This has been done. Upon my earnest recommendation Congress appropriated \$1,000,000 to begin, upon an elaborate plan, the real development of aviation in the Navy. It also approved my request to pay aviators an increase of 50 per cent and we are organizing a class of capable aviators. To make immediately effective this statute, three new hydroairplanes have just been purchased, which is but the beginning of the work of aviation, now well advanced along the lines of a well-considered plan. I regard this as one of the most far-reaching steps taken by the Wilson administration.

AS TO SAVINGS EFFECTED.

All this unprecedented increase in the Navy has been secured, too, without large increase in appropriations, how? By avoiding unnecessary expenditures ashore, by reducing the cost of work ashore while maintaining its quality and reducing appropriations for enlargement of shore stations, by securing real competition, and by economy. During the four years of Taft, \$21,928,572 was appropriated by Congress for the public works alone of shore stations. Two naval bills have been passed by the present administration, and they carry together, for the public works of shore stations, a total of \$3,920,880. We have greatly reduced expenditures ashore and greatly increased them afloat and the above figures attest the change for the better. When I became Secretary ships could be built in only two navy yards. We have equipped or are equipping five additional navy yards for the construction of Navy craft, and this is being done while at the same time there is a big decrease in appropriations ashore. By securing competition I saved \$1,077,210 in one contract for projectiles. Up to date, by first rejecting all bids and demanding more reasonable figures, I have saved \$1,110,084 in the purchase of armor plate, securing lower prices than my predecessor secured. In two other bureaus alone last year \$1,800,000 was saved—more than enough to enable Congress to reappropriate \$1,000,000 of the savings for aviation and the balance for submarines. There has been the same character of savings in other ways—too many items to enumerate. So much for the material and preparation. Of course, we need constantly to increase the ships and armament, but the increase in the past two years, larger than in any previous two years in the history of the country, is an earnest of what will come in the regular and orderly and necessary increase of naval equipment.

But of what worth is a ship without well-trained men? What has the Wilson administration done as to personnel? It is a pleasure to tell you that for the first time in years the enlistment is up to the limit prescribed by law and part of the year we have had a waiting list. Since I became Secretary of the Navy we have increased the enlistment 5,824 men, enabling us to commission fully 20 submarines, 4 battleships, 4 destroyers, 6 gunboats, 1 battleship, 6 cruisers, and 3 monitors, increasing the total number of commissioned vessels by 41 over the number commissioned on March 1, 1913. I regard this as a great achievement, particularly since the Navy had not formerly been able to secure enough men to fill the quota. It has been secured, too, without letting down the standard for admission, which has been maintained, and even raised. For every recruit accepted five were rejected because they did not come up to our high standard. To what is the increase of our enlistments attributed? The answer is easy: To the establishment of schools, opportunity to see the world, and for promotion afforded enlisted men hitherto denied them. In these two years 13 enlisted men have been appointed as assistant paymasters, 5 as midshipmen at Annapolis, and 12 as ensigns. It is true that prior to the Wilson administration it was possible for an enlisted man to be promoted to be ensign, but in the four years of the Taft administration only 3 were promoted, while

In the 2 years of the Wilson administration 11 have qualified. How does this happen? The new policy of education and assistance was put into operation in 1913. Now every ambitious and aspiring young enlisted man is given special instruction when he desires it. Upon my recommendation Congress passed an act which gives all the positions of pay clerk to these enlisted men who can qualify: This opens 200 more places to enlisted men. It is true to-day as never before that a boy may enlist in the Navy and by the display of ability be promoted to the grade of admiral. Not only has the enlistment been increased by 5,824 new recruits, but Congress gave us the best reserve bill any nation ever put upon the statute books. While reenlistments have increased 12 per cent, desertions have decreased 17 per cent. Another incentive to enlistment is the new policy which leaves an open door to young men to retire from the Navy other than through the door of the prison; and likewise the modern methods of treating men who have violated rules.

With special emphasis, I beg you to ask any well-informed man in or out of the service as to the ability and capacity of the various officers whom I have called as advisors and to the heads of the bureaus. You will find that the man selected in each bureau is recognized, both in our own and foreign navies, as an able expert in his line.

One word more: For years there has been an unsuccessful insistence that Congress should reestablish the grades of admiral and vice admiral. I earnestly urged the last Congress to create these positions. It authorized three of them. Now American naval officers while abroad will no longer be outranked by officers of nations with insignificant navies.

I have answered your questions at some length. There are two reasons for the length of my letter:

1. Because these two years have been epoch making in the Navy, distinguished by more wise and progressive naval legislation and more practical achievement than any previous like period (thanks chiefly to a patriotic Congress); and

2. Because certain persons, ignorant of their ignorance, and for selfish partisan reasons, have busied themselves with misrepresenting the true condition of the Navy, thereby causing some good people to fear that the Navy is not now, as in the past, the strong effective right arm of the Republic. All who would learn the truth may be assured that the Navy of 1915 is larger, better equipped, and in better condition than in any previous year, and that the fleet is becoming more efficient with every passing month. "We shall take leave to be strong upon the sea in the future as in the past," declared President Wilson in his message to Congress; and in the interest of the self-respecting peace, which is the only peace worth preparing for, it is devoutly to be hoped that this strength may not be questioned by others or endangered from within. The record above outlined shows that what he promised for the Navy has been fulfilled.

Sincerely, yours,

JOSEPHUS DANIELS,
Secretary of the Navy.

The CHAIRMAN. I think this is a good place to stop, and we will adjourn until 3.15 o'clock this afternoon.

(Thereupon, at 12 o'clock m., the committee took a recess until 3.15 o'clock p. m.)

AFTERNOON SESSION.

The subcommittee reconvened, subsequent to the taking of a recess, at 3.15 o'clock, Senator Frederick Hale (chairman) presiding.

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Mr. Chairman, when the recess was taken at noon we were discussing the preparations made before we entered the war, particularly in 1915 and 1916, in answer to the several criticisms of the department in those years. I wish to either put

in the hearing or to read a statement made by Admiral Benson, Chief of Naval Operations, at the alumni banquet at the Naval Academy, which gives the whole work of Operations and much of the work of the Navy touching Operations from the time Admiral Benson came into the office in 1915.

The CHAIRMAN. I think it would be all right for that matter to be put in the record.

Secretary DANIELS. Yes.

(The matter referred to is here printed in full in the record, as follows:)

SPEECH OF REAR ADMIRAL BENSON, CHIEF OF NAVAL OPERATIONS, AT THE ALUMNI BANQUET AT THE NAVAL ACADEMY.

Mr. Toastmaster, fellow graduates, and guests, in calling upon me to answer to the toast, "The Navy," the object of the graduates' association is, I take it, to satisfy, perhaps, the expectation of the service that I give an account of my stewardship as Chief of Naval Operations.

I may preface my remarks by saying that, as time has gone on and the work of the office has developed, more distinctly outlining some of the vast problems involved, I have become more and more fully convinced that those who conceived the idea of creating by law a Chief of Naval Operations have, in the establishment of this office, "built better than they knew." In speaking on this subject I do so without any intention of making odious comparisons and without any desire to attempt to enlarge upon the importance of the work or to magnify what has been already accomplished; and yet, in order to be quite sincere and candid, I must say that upon taking up this work a little over one year ago I started practically from the ground. There were then certain elements of routine being carried out which might in a way be called the fragments of organization, but certainly nothing more. There were no data from which the chief of the office could obtain information at short notice. Only a few hours after assuming office it was necessary that a vessel of a certain class be sent from Hampton Roads to New York, and it took hours to find out just what vessels were available in that vicinity, and particularly what ones were suitable for the duty to be performed. There were no definite data at hand relating to material or personnel. In order to find out about material it was necessary to send to some other office and get information piecemeal. Information as to personnel and as to the relation between personnel and matériel could only be obtained by consulting the several bureaux' files. In fact, no information except what was given in certain regular publications was available to show the relative strength of the various nations of the world. So it was necessary literally to begin at the bottom. It is true there were some efforts at organization which had been carried forward nearly to completion.

A board for the organization of the radio service had made its report and recommended an organization for adoption, but this report had not been approved and the older unformed system in the radio service was still in vogue. Messages for radio transmission were sent out by telephone to Arlington, if received during ordinary office hours, and were given attention by the Arlington operators at their convenience. Message received at night from Arlington or elsewhere had to await the opening of the office the next morning before being decoded and delivered.

Such facts as these serve to indicate the conditions formerly existing, and are recounted simply that the service may know what has been done since the establishment of this office and what is being done now, and I want especially to emphasize them in order that the service may have a true estimate of the situation, and not be led astray or unduly influenced by what seems to have been a persistent effort during the past year or so on the part of certain persons and in certain elements of the press to try to create the impression not only in the minds of the public, but even in the minds of naval officers themselves, that nothing has been done in the department to improve conditions. And let me state here that the conditions which I have found to exist could not in any degree be laid at the door of the Secretary. He has, at all times, shown the most earnest interest and the most cordial sympathy in all the various features recommended for the development of this office, and he has given particular attention to every measure tending to increase its efficiency and the efficiency of the service in general.

The report of the board on the organization of communications, which I have already mentioned, has since been approved and is now in operation, and I do not hesitate to express the firm belief that it is the most thorough and efficient organization of its kind to be found either in the service or out of it. The office space occupied by the Chief of Naval Operations and his staff has been expanded from its formerly overcrowded condition to include nine rooms. These rooms have been cleaned, renovated, and equipped, and they are now kept in a condition that leaves little more to be desired. One of these rooms has been fitted up especially to meet the needs of the communication service. A soundproof compartment has been constructed, in which the radio operators are on constant watch day and night, and a space adjoining this compartment has been fitted for the telegraph and telephone operators. A commissioned officer day and night keeps watch to code and decode and to receive and send messages of every character without delay.

The subject of extending communications throughout the world has been given careful attention and, under the direction of Capt. Bullard, the superintendent of the Naval Radio Service, phenomenal progress has been made toward the establishment of a system by which communication within our own country may be developed and improved and, in cooperation with the systems in Pan-American countries, expanded throughout the Western Continent. The subject of radiotelephony has, through the cooperation of Capt. Bullard and his men with the telephone companies, reached a development little short of marvelous. At the instance of the superintendent of radio, the various companies interested in this question agreed to mobilize their utilities and hold a demonstration which would show to what extent their systems of communications could be used.

Some two weeks ago, when this demonstration took place, I sat in my office and, within the short space of time of less than two hours, transacted business by land, wire, and radio telephone with the commandant at the Puget Sound Navy Yard, the commanding officer at Yerba Buena, San Francisco, the commandant at the Mare Island yard, the naval station at New Orleans, the aeronautic station at Pensacola, the commandant of the Charleston Navy Yard, the commanding officer of the *New Hampshire*, then at sea off the Capes of Virginia, the commandant of the Philadelphia yard, the president of the War College at Newport, and the commandant of the Boston yard. Communication was most satisfactory and conversation between myself and the officers with whom I talked was taken down by a stenographer in my office, so that a complete record of all business transacted was available at once.

Soon after the appointment of the Chief of Naval Operations, the duties of the aid for material were transferred, by the order of the Secretary of the Navy, to the cognizance of the Chief of Naval Operations, and were placed immediately in the hands of one of his assistants. This change has served to provide positive means for the Chief of Naval Operations constantly to keep in touch with the material condition of the fleet and with the preparedness of individual vessels for active service. Work of the material bureaus is quickly coordinated under the immediate knowledge and assistance of the office of Operations.

A plan of organization of the fleet on a large scale has been worked out and is now in operation. This plan is so arranged as to provide an organization for the entire naval force of the United States, or for any portion of it in any part of the world. The various elements of the fleet have been given definite organization and flag officers have been detailed to the command of each, so that it may be justly said that the fleet is, for the first time, completely and thoroughly organized.

One of the first steps taken for the improvement of the organization of the fleet was with a view to the betterment of the submarine service, and to this end an officer of high rank has been detailed to command the submarine flotilla.

The subject of aviation also has been given especial attention and every effort has been directed toward concentrating the development of aircraft toward a definite service. Aircraft have been placed in the same category as other craft, and the various bureaus have been assigned specific duties bearing upon their construction and development and have assumed the responsibility for the work coming within the cognizance of each.

A thoroughly digested and well-developed plan of mobilization for the entire fleet in the event of war has been submitted to the department and approved. Each bureau and officer in the department has been assigned its particular

duties in connection with the plan and reports quarterly to the department, giving in detail the progress of each toward preparedness to accomplish its task in mobilization.

The General Board has deliberated on the list of available merchant vessels useful for naval purposes in case of war, and has determined the characteristics required for the special assignment of each. Guided by these requirements, the board of inspection and survey is now engaged in making a careful inspection of these merchant vessels, reporting for each the necessary alterations and equipment to fulfill the duty to which they have been assigned in the naval auxiliary service. Each merchant vessel inspected is assigned to a certain yard, where, in the event of need, it would be altered and equipped for naval service and where it would be supplied and repaired. The necessary equipment and supplies for such vessels are being sent as rapidly as possible to the yard at which these ships would be outfitted, so that in the case of emergency or war this work will be accomplished in the least possible time. Records are being kept at the department in such condition that complete data are immediately available showing just what vessels could be used, what alterations would be necessary, and, in preparation for the event, all details, even to the drawing up of contracts, are being perfected in advance.

In past years the organization of naval districts has been merely a nominal one. The plan for the organization of naval districts has within the year been taken in hand and has been worked out in every detail. Each naval district will be organized according to a common scheme, and the general plan, together with a sample organization for one district, will be furnished to each naval district for filling in all data as to number and class of vessels, the organization and duty of personnel, etc. The question of mine localities within our ports and along our shores has been studied, and the number of mines for each district and for our outlying defenses has been determined. Officers have been assigned to the various duties in the district for war service, and the distribution of vessels for the district defenses has been made, each vessel being assigned to its well-defined function in the defense.

Plans have been completed for the mobilization of the Naval Militia, and detailed instructions have been prepared providing that each step in the mobilization shall proceed without interruption and with the utmost expedition. In addition, special attention has been directed to peace-time training of the Naval Militia, and arrangements have been made for sending the Naval Militia to sea this summer on board nine of the older battleships not attached to the active fleet. Arrangements have also been made for a cruise with citizen volunteers for training, on the general principle of the Plattsburg encampments conducted by the Army, and during four weeks in the latter part of August and the first half of September these volunteers will cruise at sea and will exercise during the last week with motor boats in conjunction with the battleships, destroyers, and submarines, working out such problems as would arise in time of war.

The organization of the ships in reserve has been given special attention. Not only have the complements been increased, but special attention has been paid to the ratings of the men on board, so that the important stations will at all times have a sufficient number of well-trained men properly to break in the additional personnel that would be required to fill the complements. The ships are kept in material readiness, so that it will be necessary only to fill the complements in order that they may be ready to join the active fleet. A system of periodical inspection of every ship belonging to the Navy has been established, and its good results are already apparent.

Regulations have been drawn up by a joint board for the proper control of the Coast Guard, which automatically comes under the Navy in time of war.

In response to the request of the department, the General Board has been indefatigable in making out the plans and selecting the locations for advanced bases and in determining the location of submarine bases and working out the detailed plans for their development.

The annual period of overhaul for vessels has been discontinued. The old system under which for three months, and often for a longer period, in every fifteen vessels of the fleet lay at a navy yard unreadiness in material respects and demoralized in personnel has been done away. These demoralizing influences, due to stagnation at navy yards, were well known to every officer, and it will be appreciated that they must have had a very bad effect upon the Navy. It was only natural, under the old system of lengthy overhauls, that spare parts

would be used up and important work postponed that could have and should have been done at once in order to keep the ships in first-class condition. Such prolonged periods of inactivity at a repair yard during which the unavoidable disorder incident to the pressure of large numbers of workmen on board, and sometimes with the added discomfort of climate, could not help but have a very serious and detrimental influence upon the ships' personnel, besides immensely increasing the expense of maintaining the fleet.

At the present time practically every vessel of the fleet is ready to perform its designed duty except possibly the *Georgia*, which is to have new boilers installed, and the *Connecticut*, which is having extended boiler work done, one or two of the earlier submarines now being utilized for experimental purposes, and some of the later destroyers.

The equipment of my office has been greatly improved and added to. Data on all essential subjects have been collected and kept near at hand and are constantly being added to. Because of this improvement I was able when called before the House Naval Committee during the present session to give full and exact information of our own and the other principal navies of the world, and was able to show not only in figures but graphically to the eye the number and type of ships of each of the principal navies of the world. Photographic silhouettes of the ships of the several navies were made and pinned upon sheets in groups according to type, so that a clear idea of the relative strength of the various fleets could be obtained at a glance. These sheets will eventually be placed upon the walls of one of the offices.

An annual program of operations of the fleet has been worked out and adopted and has so far been followed without difficulty. There is no reason to believe that it can not be successfully followed as a standard yearly program. In my office there are kept data and records from which at a moment's notice one can determine the whereabouts of every vessel of the service, and within a very few minutes the position of any merchant vessel can be located. On the walls of the office general charts and charts of places of special interest throughout the world are kept on chart rolls in the most convenient manner for easy reference. In another office there is a roll on which are maps showing the interior subdivisions of various countries and giving almost every kind of desirable information connected with the naval service.

Cooperation between the various bureaus and offices of the department with the office of the Chief of Naval Operations has been most cordial and complete and the practical result has been all that could be desired. One day in each week the Secretary holds in his office a council composed of the chiefs of bureaus, heads of the various offices, the Assistant Secretary of the Navy, and the Chief of Naval Operations. At these meetings various questions of importance affecting the whole service are considered, the progress of work on ships discussed, new enterprises gone into, and a decision arrived at under the most favorable circumstances for wise action. Through these councils all are kept informed of important work, and a hearty cooperation followed by satisfactory execution of the Secretary's decisions is the result. In addition to this weekly council, the Secretary of the Navy, through his own efforts, has organized a naval advisory council, known as the Naval Consulting Board, which, with his approval and sympathy, is collecting vast stores of information regarding the industrial resources of the country, and is perfecting a plan for the utilization of these industries for the support and assistance of the Army and Navy for the defense of the country in time of need.

A thoughtful consideration of the work that has been accomplished will show that all is being done now that could reasonably be expected from a so-called general staff. In my opinion, the organization that exists in the department, and that is now in successful operation, is accomplishing in a purely American and businesslike manner all that could possibly be expected from the creation of a general staff, and is, I believe, doing this in a much more satisfactory way. It is folly to talk of or to advocate clothing a Chief of Staff or a Chief of Naval Operations with authority independent of the head of the Navy. Such independent authority would lead on to confusion and would do great harm.

The fact that the bureaus as now constituted represent the different sections of the general staff, that they have their special appropriations and are responsible for the proper expenditure of moneys under their control, and of the proper development and operation of the various parts of the Naval Establishment under their cognizance, gives, in my opinion, to the organization of the Navy Department a distinctive strength and an added efficiency not possible under a so-called general staff organization. The present organization should

be made stable and permanent, and if legislation is necessary to make this absolutely sure, then there can be no doubt that such legislation should be enacted, but in considering any legislation care should be taken that too great restriction is not imposed upon the freedom of action of the head of the Navy.

I desire to add that all the results I have related have been accomplished with the Secretary's assistance. No new legislation has been necessary, and all that has been required of me has been to present the need and desirability of changes and improvements in order to receive the Secretary's sympathetic attention. He does not blindly yield to suggestions, but gives them the most earnest and thoughtful consideration. As the Secretary has often reiterated, his only requirement is that the proposed change shall add to the efficiency of the Navy in order that both the Navy's personnel and material may be capable of rendering and may be made to render 100 per cent efficiency. This policy of 100 per cent efficient service has been the basic creed of the office of operations, and when we shall have fulfilled that policy every unit of the fleet will at all times be ready to perform its functions, whatever the occasion that may require its service.

Secretary DANIELS. Continuing on this same line, the *Lusitania* was sunk on May 9, 1917, Admiral Benson became Chief of Naval Operations on May 11, 1915, and on May 15, 1915, there was a review of the fleet at New York by the President of the United States, one of the most notable reviews of the fleet in the history of the Navy. On that occasion Admiral Dewey, the Admiral of the Navy and the chairman of the General Board, was unable to be present, much to the regret of the President and all of the officers of the Navy and of all of the men in the fleet, who had hoped that he would honor the occasion and permit them to honor him; and he wrote the following letter, which I read at a dinner in New York, to the fleet [reading]:

THE ADMIRAL OF THE NAVY,
Washington, May 14, 1915.

MY DEAR MR. SECRETARY: I trust that you will be good enough to convey to the mayor and citizens of New York City my sincere regret at my inability to be present at the ceremonies incident to the review of the Atlantic Fleet and my cordial appreciation of the hospitality they have shown in the reception of the officers and men.

On this occasion I recall with the utmost pleasure the magnificent welcome I received in their great city upon my return from Manila on board the *Olympia* in September, 1899, and it is a source of deep satisfaction to know that the interest of our citizens in their great Navy has not diminished in the 16 years that have elapsed since that time.

The people of New York have just cause for pride in the fleet now assembled in their harbor. Not only is it composed of the finest and most efficient warships that we have ever had, but it is not excelled, except in size, by the fleet of any nation in the world. Our ships and guns are as good as any in the world; our officers are as good as any; and our enlisted men are superior in training, education, physical development, and devotion to duty to those of any other navy. (As president of the General Board for the last 15 years, I can say with absolute confidence that the efficiency of the fleet has steadily progressed, and has never been so high as it is to-day.)

However, we need more ships, more officers, and more men, and should continue the wise policy of increasing the size of our Navy, which must ever remain our first and best line of defense. This defense unless adequate is impotent; and adequacy is not reached until the Navy is strong enough to meet on equal terms the navy of the strongest probable adversary.

Very sincerely, yours,

GEORGE DEWEY.

HON. JOSEPHUS DANIELS,
Secretary of the Navy, Washington, D. C.

There was no man in the world, certainly no man in America, so well qualified as Admiral Dewey to express an opinion upon the efficiency of the Navy at that time. He had been the chairman of the General Board almost from the time he returned to America after the

victory at Manila, and until the day of his death there was no man in the Navy who was so keenly alive and who was so well informed about all naval activities as Admiral Dewey; and when he said "I can say with absolute confidence that the efficiency of the fleet has steadily progressed and has never been so high as it is to-day" that statement stands in perfect contradiction and refutation of any other statements to the contrary.

On May 15, four days after Admiral Benson became Chief of Naval Operations and a week after the sinking of the *Lusitania*, the President reviewed the Atlantic Fleet at New York, and in an address at a dinner given the officers that night I set forth clearly our purpose and intention to create a greater Navy, saying:

Our Navy is good; it is not good enough. With your help, as long as I am Secretary of the Navy we will all try to make it better. The Navy is strong; it is not strong enough. With the help of the whole American people, with the help of Congress and an administration thoroughly committed to the policy of "taking leave to be strong upon the seas," we will make it stronger. This review is not the end of a century's labors. We do not here exhibit our completed work. Indeed, we have here only that portion of the Atlantic Fleet which has been engaged in active maneuvers since February.

Rather, we here begin a new era, supported by the Chief Executive and by an enlightened and progressive Congress, which gave evidence of its faith in a strong Navy by the passage of the best Navy bill in the history of your country. That bill carried the largest appropriations ever voted for new construction. We are entering upon an era of progress such as the Navy has never known before, whose keynote will be onward and whose watchword will be forward—an era marked by the lifting of our Navy out of politics and by the subordination of all things afloat or ashore to the efficiency of the fleet in order that by our very strength we may be able to demand the right to live at peace with all the world.

In July, 1915, a month after the sinking of the *Lusitania*, I directed the General Board to express its opinion as to what the Navy must be in the future in order to stand upon an equality with the most efficient and most practically serviceable and to submit "a program * * * formulated in the most definite terms * * * planned for a consistent and progressive development of this great defensive arm of the Nation."

On July 30 the General Board reported as follows:

In compliance with the oral order of the Secretary of the Navy to express its opinion at the earliest practicable date as to a policy which should govern the development of the Navy and a building program, the General Board reports as follows:

I submit that report.

(The report referred to, pages 73 to 78, inclusive, of the Annual Report of the Navy Department for the fiscal year 1915, submitted by Secretary Daniels, is here printed in full in the record, as follows:)

[Appendix A.]

REPORT OF THE GENERAL BOARD.

DEPARTMENT OF THE NAVY, GENERAL BOARD,
Washington, November 9, 1915.

To: Secretary of the Navy.

Subject: Report in accordance with article 167R, paragraph 3.

In accordance with Navy Regulations, article 167R, paragraph 3, the General Board submits the following report. It does not include in this report a building program for the fiscal year of 1917 for reasons that appear in succeeding paragraphs.

2. In July last the General Board was called upon to express its opinion to the department "as to what the Navy must be in the future in order to stand upon an equality with the most efficient and most practically serviceable"; and to submit "a program * * * formulated in the most definite terms * * * planned for a consistent and progressive development of this great defensive arm of the Nation."

3. Accordingly, under date of July 30 (G. B., No. 420-2), the General Board reported as follows:

"In compliance with the oral order of the Secretary of the Navy to express its opinion at the earliest practicable date as to a policy which should govern the development of the Navy and a building program, the General Board reports as follows:

" POLICY.

"The Navy of the United States should ultimately be equal to the most powerful maintained by any other nation of the world. It should be gradually increased to this point by such a rate of development year by year, as may be permitted by the facilities of the country, but the limit above defined should be attained not later than 1925."

At the same time the General Board submitted a building program for the fiscal year 1917 only, which in its opinion would be adequate to the requirements of the Nation if continued in subsequent years on a similar scale.

4. In a letter dated October 7, 1915, the Secretary of the Navy directed the General Board to prepare "a building program for the Navy that will continue over a period of five years, with an expenditure of about \$100,000,000 each year for five years, on new construction only." This the General Board did, under date of October 12, 1915 (G. B., 420-2), with special consideration as to the first year's schedule.

5. The General Board is convinced of the great advantages, both military and economic, which will follow upon the acceptance of the general principle of a building program extending over a period of years. This is the first time that any administration has decided to present to Congress a continuing shipbuilding program. On one hand a continuing program enables the Navy Department to plan with greater foresight than is possible with an annual noncontinuing program. The military end to be reached at the close of such a period is thus made clearly evident by the Navy Department to Congress and to the country. On the other hand a degree of financial security is offered the industries of the country by the fore-knowledge which they thus obtain as to probable naval expenditures. This will encourage them to invest money in enlarging their plants for naval shipbuilding and all its allied industries. At the same time the strong probability of continued work throughout the period of the program will tend to reduce contract prices.

6. The General Board believes that the course of the present war in Europe affords convincing reasons for modifying the opinion which it has expressed for the past 11 years as to the proper size of the Navy. A navy in firm control of the seas from the outbreak of the war is the prime essential to the defense of a country situated as is the United States, bordering upon two great oceans. A Navy strong enough only to defend our coast from actual invasion will not suffice. Defense from invasion is not the only function of the Navy. It must protect our sea-borne commerce and drive that of the enemy from the sea. The best way to accomplish all these objects is to find and defeat the hostile fleet or any of its detachments at a distance from our coast sufficiently great to prevent interruption of our normal course of national life. The current war has shown that a Navy of the size recommended by this board in previous years can no longer be considered as adequate to the defensive needs of the United States. Our present Navy is not sufficient to give due weight to the diplomatic remonstrances of the United States in peace nor to enforce its policies in war.

LESSONS OF THE CURRENT WAR.

7. Considering a building program for the Navy Department the General Board has noted the progress of the war abroad in order to profit by its lessons in making recommendations to the department as to the type and relative numbers of ships to be laid down.

8. The superiority of the naval forces of the entente allies has been so great as to remain without serious challenge. By this great superiority they have securely held the objective of all naval effort; namely, the control and utilization of ocean communication on behalf of their own trade and commerce and military transportation, while denying such utilization to their enemies.

9. Owing to the disparity of the opposing naval forces, the main naval strength of the Central Powers has not yet undertaken the task of meeting that of the enemy, and the naval events of the war have been confined to a double series of minor incidents. In the first series fall the world-wide attacks upon the commerce of the entente allies by a small number of hostile raiders, which have finally been destroyed or driven from the seas by systematic pursuit.

10. In the second series falls the work of the submarines. The deeds of the submarines have been so spectacular that in default of engagements between the main fleets undue weight has been attached to them. It is desirable to arrive at a true estimate of their importance, which, although undeniable, is less than the public believes. The North Seas, across which the combatants face each other, is not of great extent, and its comparatively limited area offers a field not too large for the submarine to maneuver in any part of it.

11. Consequently, at the beginning of the war, in the North Sea and elsewhere about Great Britain, and later in the Mediterranean, where conditions were not entirely dissimilar, the German submarines obtained some striking successes against the Allies before the latter, who held the general control of the sea, discovered the proper method of guarding against attack by their invisible enemy. Both in the North Sea and in the Mediterranean the submarine upon its first appearance scored heavily. Its high score was obtained by surprise; it was not due to inherent combatant superiority.

12. After 6 months of war the submarine form of attack drew renewed attention by its direction against hostile commerce. American public attention was redoubled toward this side of the war owing to the humanitarian interests involved, and to the diplomatic questions which were raised thereby. To hastily formed public opinion, it seemed that submarines were accomplishing great military results because little else of importance occurred in the maritime war to attract public attention. Yet at the present time, when the Allies have learned in great measure how to protect their commerce, as they learned a few months previously to protect their navies from the submarine menace, it is apparent that the submarine is not an instrument fitted to dominate naval warfare. It appears from British returns that the first 8 months of this submarine warfare against British commerce resulted in the loss of 183 merchant vessels and 175 trawlers. The total British merchant tonnage lost was not greatly in excess of one-half a million; the total loss under all flags was about 650,000 tons. In the same time the total arrivals and departures in British ports averaged from 1,350 to 1,400 per week, or nearly 50,000 in all. Allied commerce is continuing under a loss in no way vital. The submarine is a most useful auxiliary, whose importance will no doubt increase, but at present there is no evidence that it will become supreme.

13. As to types of ships, the conclusion to be drawn so far from the history of the current war is that the battleship is still the principal reliance of navies, as it has been in the past.

NEED OF FAST SHIPS.

14. The United States Navy has hitherto been somewhat ill balanced as to the different types of ships represented in it, as battleships need auxiliaries of every sort, both combatant and administrative, for their support in battle and in being. These auxiliaries have not been authorized in proper proportion.

15. With its two extensive coast lines the United States offers great opportunities to an enemy to descend by surprise upon its shores. To meet such attack the tendency of the country is to place too much reliance upon localized defenses such as fortifications, mines, and submarines. These are essential, but these alone can not accomplish and defeat him before he reaches the neighborhood of the coasts. For this purpose the country must rely upon the seagoing fleet. To forestall the attack of the enemy our main fighting force must be concentrated at a strategic center, ready to move and defeat the hostile main body before it has entered an area where its presence is seriously dangerous to this country's interests. When concentrated, the main fleet can expect to

move in time to forestall the enemy's intentions only if it has an adequate information service to provide early and continuous intelligence of the enemy's movements. An efficient scouting force composed of battle cruisers and scouts must be thrown far beyond the main body to assure this indispensable service of information, which can not otherwise be secured. In default of information the main fleet can only act blindly.

THE USE TO BE MADE OF SCOUTS.

16. In the general development of our naval strength, the time has now come to provide for battle cruisers and scouts. The main duty of both types is to get information. For this purpose numbers are necessary, and to provide these numbers without undue cost we have recourse to the scout type, wherein the size is as small as will afford adequate speed and radius for the accomplishment of the work. A scout in the pursuance of her duties should rather avoid than seek battle. Yet she must seek and maintain contact with the enemy, and, therefore, can not dispense with a small armament for her protection when unavoidably forced into an engagement by ships which she can not evade.

THE USE TO BE MADE OF BATTLE CRUISERS.

17. The battle cruiser, also chiefly meant to secure information, nevertheless has a somewhat different rôle from that of the scout. In addition to high speed and endurance the battle cruiser has high offensive powers, so that if necessary she may fight for information and break through a battle screen. Another important duty of the battle cruiser is to support the protective screen of lighter craft about her own fleet, which is formed to detect the approach of the enemy and guard the main body from surprise.

18. The battle cruiser can do all that the scout can do and more, but her greater powers entail greater cost. If the financial question were not involved, all ships built to seek information would be of the battle-cruiser type.

19. By her size, speed, and armament, the battle cruiser is well able to perform other combatant services than her primary one of offering security and information to the main body of battleships. She may be used to protect national sea routes, both military and commercial, and attack those of the enemy. As high speed is particularly important in torpedo warfare, she may aid the battleships in a general action by taking up a favorable torpedo position where her own heavy guns will also be effective.

20. Precedent to a general naval action we may normally expect the seas to be swept by the lighter and faster craft of both belligerents seeking to damage hostile trade, to discover the intentions of the enemy and to draw him into eccentric and unwise movements. Such has been the principal employment of battle cruisers in the present war. They have been in contact with the enemy and their performances have attracted much public attention, but as yet the main forces of battleships have not been engaged and the control of the sea remains in the hands of the powers having the superior battle fleet.

21. As in the case of submarines, so in the case of battle cruisers, the particular course of the present war does not justify the prevalent exaggerated idea of their importance.

NEED OF FLEET AUXILIARIES.

22. The General Board has little to add to its report of last year concerning other types of ships recommended. The General Board has thought necessary to recommend a reasonable increase of fleet auxiliaries which are necessary to the movements and maintenance of the fleet.

PERSONNEL.

23. The General Board recommends that legislation be sought for the fiscal year 1917 which will authorize an active personnel, officers and enlisted force, capable of—

(a) Keeping in full commission all battleships under 15 years of age from date of authorization; all destroyers and submarines under 12 years from date of authorization, half of the cruisers, all gunboats, and all necessary auxiliaries that go with the active fleet.

(b) Providing partial complements for all other ships in the Navy that would be placed in active use in time of war.

(c) Providing the necessary personnel for training and for shore stations.

ENLISTED MEN—NAVY.

24. The partial crews mentioned under (b) should be 50 per cent of the full complement for battleships, cruisers, destroyers, and submarines. They should be permanent in order that they may be kept thoroughly trained and the ships maintained as efficient units of the fleet, ready for immediate service in case of emergency by simply filling the complements. For other ships the partial crews should be adequate for their upkeep.

25. This does not provide sufficient personnel for war. With full war complements for all ships of the Navy ready for service in 1917 and a minimum number required at shore stations 74,700 men will be needed. In addition, upon the outbreak of war the personnel of the Navy must be greatly expanded to provide for aviation, coast defense districts, patrol draft, and other auxiliary duties of every sort, as well as for a reserve of men under training to replace casualties. The Coast Guard, Naval Militia, and Naval Reserve will be far from sufficient to meet these demands. The Navy is the first line of defense of the country. For peace requirements in the fiscal year 1917 the General Board regards as inadequate any smaller force than 67,000 men in the regular Navy.

MARINE CORPS.

26. The Marine Corps should also be increased. There are now new demands from many points to provide guards at magazines, powder factories, and other important property. To meet them it has been necessary to interfere seriously with the maintenance of detachments of proper strength on board ship and with the continuance of the training of the advance-base force. These new demands would be accentuated if the United States were itself at war. The Navy Department has approved the recommendation of the General Board that the strength of the Marine Corps should be 20 per cent of that of the Navy. The General Board recommends that the authorized strength of the enlisted men of the Marine Corps for the fiscal year 1917 be 13,400 men.

OFFICERS.

27. At the present time the expansion of the Navy calls for an increase in the number of officers and revision of their distribution in the various grades.

28. In recommending an increase in the number of officers of the Navy the General Board has had in view—

(a) Adequate complements for all ships included under paragraph 23.

(b) A sufficient number to fill the necessary stations on shore.

To accomplish this the General Board finds that the total number of commissioned line officers, exclusive of the flag officers, should number 2,700 for the fiscal year 1917. The General Board recommends that Congress be requested to authorize this number, to be reached through the Naval Academy, as speedily as possible.

29. In every grade, the numbers in the grade should correspond with the number of positions to be filled whose responsibilities are in accordance with the rank. A very considerable increase is needed in the number of lieutenants and lieutenant commanders; less proportional increase is needed in the higher grades. As the Navy increases the duties appropriate to each grade will increase in about the same ratio as the whole strength of the Navy.

30. The various ranks of the Navy are established to correspond broadly to various classes of duty whose importance and responsibilities vary. Increased responsibilities are assigned to increased rank. At present the numbers in all the grades except those of ensign and lieutenant (junior grade) are fixed by law. The present increase in numbers in the body of officers is entirely in those two grades.

31. The General Board invites particular attention to the serious congestion in the grade of lieutenant (junior grade), which demands a remedy at the earliest practicable moment. The present condition is a serious detriment to the efficiency of the service, and it is rapidly growing worse.

32. The General Board limits the part of its report regarding the numbers in grade to an earnest recommendation that those numbers be established by Congress as a percentage of the entire number of officers. At the present time the grades have a strength established by fixed numbers (except as noted in the grades of ensign and lieutenant junior grade) without reference to the total number of officers. This method has no flexibility; in order to keep the numbers

in grades properly proportioned to the needs of the service it is necessary to revise them periodically. This readjustment, while it is made from time to time by Congress, has not been done frequently enough to meet the needs of the service. The establishment of fixed percentages in grades would automatically provide for readjustment, while at the same time Congress would keep the whole matter under its control, by establishing the total number of officers instead of the numbers in each of the several grades.

33. The officers of the Marine Corps, line and staff, should number 4 per cent of the total number of enlisted men of that corps. They should be recruited from the graduates of the Naval Academy.

34. The numbers of officers of the Medical and Pay Corps should be increased in accordance with the requirements of the service, as stated in paragraph 28; those of the other staff corps should be increased in accordance with the requirements of their special duties. Entries to the Pay Corps should be from graduates of the Naval Academy.

35. The laws of promotion should be so adjusted as to provide that officers of the rank of ensign in the line and those of corresponding rank in the Marine Corps, Pay Corps, and Civil Engineer Corps, shall have promotion to the next higher grade after the same length of service in the lower grade, and the General Board so recommends.

36. In concluding its remarks upon the personnel, the General Board invites attention to the fact that the repeal of the feature of the law of 1899 providing for the forces retirement of line officers operates to cause a stagnation in promotion. It recommends that the department seek from Congress remedial measures to insure a proper flow of promotion in line, staff, and Marine Corps, as otherwise the service will suffer grave loss of efficiency.

GEORGE DEWEY.

Secretary DANIELS. Later, on October 7, 1915, I directed the General Board to prepare a five-year program, calling for the best ships that would strengthen our Navy and would, as rapidly as possible, make it incomparably the most adequate Navy in the world.

On October 12 I received the General Board's report with their recommendations.

On October 15 the General Board presented estimates to Congress through the Treasury Department, as required by law, for the largest building program ever proposed in the history of the Nation, and the greatest ever proposed or enacted in any one single bill by any nation in the world. In my annual report, dated December 1, 1915, I presented to the President—which he transmitted to Congress—recommendations for this five-year program, which was afterwards reduced to three years, to make the American Navy ready for any eventuality.

(The document referred to presented by Secretary Daniels is here printed in the record in full as follows:)

ANNUAL REPORT OF THE SECRETARY OF THE NAVY.

NAVY DEPARTMENT,
December 1, 1915.

Five-year building program.—In presenting this report I feel it my duty to urge above everything else the necessity of the adoption by Congress of a continuing program of construction. After much reflection, conference with able experts in the Navy and patriotic men in the civil walks of life, such a program has been evolved and is submitted herewith. For the first time in the report of a Secretary of the Navy a plan is submitted which covers not only the necessities of the immediate future, but has been extended to cover a period of five years. Planning to-day what we will begin to-morrow in order to have it completed in the future is the essence of all true preparedness. It is believed that steady and constructive building plans that look ahead and permit each year's construction to fit into the general plan for our Navy as the piece of mosaic fits into the whole design, and which includes all we have learned from the struggle in Europe, as well as the knowledge of our own needs acquired in war games and

maneuvers, is the surest way to raise the standard of naval efficiency. Nothing is to be gained by the expenditure of millions of dollars in the haste of threatened war or in the panic of actual war. Less is to be gained for the proper strengthening of the Navy by sudden fluctuations and unexpected changes in policy. If a vote had been taken a few months ago as to the types of ships to be constructed, a large majority of the people would doubtless have voted to go into the building of submarines on a scale so large as to leave little money for other fighting craft. Recently in navy circles the pendulum may be said to have swung away from an overlarge undersea program with emphasis again placed upon the dreadnaught. In addition, the need for battle cruisers seems imperative. The wise policy, approved by the ablest experts and enforced by the lessons of the war across the ocean, is toward a well-proportioned Navy, the units being composed of the types which our fleet would have to meet and overcome in case of war.

A continuing program, looking ahead as well as profiting from experience, ought to give us a better proportioned Navy than under the present and past single-year method. The single-year method denied the country the obvious advantage which a well-digested continuous program would insure. It is more costly to build without reference to future years than if a plan is mapped out and adopted for a period long enough to secure the benefit that should come from longer contracts. Experience has taught us that in any year three ships of any type can be built at less cost per ship than if the contract is made for only one in a given year. Wise experience of public funds, therefore, as well as increased efficiency, will be promoted by the adoption of a continuing program.

My first thought was to present a plan for a 10-year period, but the argument against determining upon a program for a longer term than five years seemed conclusive, for in this day of invention and development it would hardly be safe to fix upon certain types of ships for a long term of years. We know what other countries have built and are building, and we know the needs which constant practice and maneuvers of the past 12 months by our own fleet have taught us. Therefore the best expert judgment approves the number and types of ships which are recommended. If there are those who believe even within these five years changes in types of ships or in equipment or armament will be so marked as to make the carrying out of the recommendations deny the benefit of new discoveries, the complete answer is this: Congress is asked to make appropriations only for a year at a time, in accordance with custom. Any succeeding Congress will make such alterations as experience may prove desirable, without a reduction of the strength of the fleet to be constructed upon the plan proposed. When a continuous policy was embraced in a bill presented to the national assembly of one of the leading powers nearly 20 years ago it was objected that by accepting it the legislative branch would be depriving itself of a considerable portion of that power of the purse which constitutes the only effective bulwark of its rights. The assembly did not abate one jot or tittle of its rights, and that body two years later, upon the recommendation of the naval administration, again increased its fleet, adding submarines and other units which naval experts had found necessary to a well-proportioned navy. The strength of the continuing program proposed for our country would depend upon its development in such a way as to prove its value.

If it be argued that one session of Congress or one Congress should not attempt to bind its successor, it is only necessary to point out that every Congress fixes a program to last more than a single Congress. When the Sixty-third Congress, which voted more money to naval increase than any of its predecessors, authorized the construction of 5 dreadnaughts, 12 destroyers, and 26 submarines—3 to be larger than any nation had constructed—it made appropriations only for about one-third of the amount it will cost to build the craft authorized. The Sixty-fourth Congress will make appropriations to continue their construction. Such binding of one Congress by another (if it can be called binding) is necessary in the building of modern warships, for they are so large and costly that it requires 34 months to build a \$15,000,000 dreadnaught and two years to build destroyers and submarines. This seems too long a time, and it is too long; but formerly it took 41 months to build a \$5,000,000 battleship. Every effort is being made to reduce the time necessary to complete a naval craft, and the time has been reduced upon some awards. This policy will be continued wherever feasible, always remembering that hurried construction is never conducive to the best and most thor-

ough workmanship. Bids opened November 17, however, do not give hope for the reduction desired.

In 1903 the General Board of the Navy, in its confidential report to the Secretary of the Navy, recommended a continuous building program, but no Secretary of the Navy urged its adoption. Indeed, up to December, 1913, when I printed the full report of the General Board as an appendix to the Secretary's report, neither the Members of Congress nor the public had access to the recommendations of that board of naval statesmen. Their report was a sealed book. Secretaries had, indeed, in the executive sessions of the Naval Affairs Committee, given some of the figures as to the number and types of ships approved by the General Board, but such information was deemed confidential. It appealed to me as a sound proposition to give the widest publicity to the formal report of this board, so that the country might have the opinion of naval experts, as well as the recommendations of the Secretary and the administration. To be sure, if the official estimates made to Congress did not harmonize with the recommendations of the General Board, the difference opened the way for a discussion as to which policy was the wiser. But discussion makes for knowledge and wise decision. The General Board is influenced by its professional views, while an administration takes into consideration the whole national policy, and does not overlook the question of national revenues. The two reports of the General Board will be found in Appendix A and Appendix B.

It was in 1903 that the General Board formulated a policy "having in view an estimate and forecast of the future as to what would be the development of foreign countries with which conflict might be probable and what our own development should be to insure peace." At that time the General Board recommended "the adoption of a continuous naval policy to be pursued by Congress in making appropriations whereby the strength of the fleet shall be increased regularly." The basis of the fleet then recommended was 48 battleships by 1919 and lesser units and auxiliaries were recommended in the proportions believed to be best to complete a fighting fleet. It contemplated two battleships each year. When their report for a continuing program was submitted 10 battleships were completed and 14 had already been authorized, and a two-battleship program would, by 1919, have secured the authorization of 24 more, all of which would have been completed by 1919. As against the five dreadnaughts authorized by the last Congress, the Secretary of the Navy, in 1903, the very first year after the General Board's recommendation, asked for only one more battleship, and that session authorized only one. Later on, in March, 1913, no doubt having in mind the failure of naval authorities and Congress to adopt a continuous policy, the General Board made this statement:

There is not now, and there has never been in any true sense, a governmental or departmental naval policy. The fleet as it exists is the growth of an inadequately expressed public opinion; and the growth has followed the law of expediency to meet temporary emergencies, and has had little or no relation to the true meaning of naval power, or to the Nation's need therefor for the preservation of peace and for the support and advancement of our national policies.

The Sixty-third Congress took long strides toward formulating a better naval policy, enacting long-desired legislation of the most serviceable character which will increase the efficiency and strength of the fleet. It opened new doors for promotion of officers and men. It remains for the Sixty-fourth Congress to add to that record the adoption of a continuous five-year program that will make the Navy every year more worthy of this great Republic. The objection may be made to such a continuous program that advantage would not be taken of all progress and experience in the period fixed upon. The General Board, when in 1903 suggested a program that would give us 48 battleships by 1919, answered that objection in this language:

While necessarily desirable and possible to keep in view the general outline of a building policy that should be systematically pursued, no one can forecast the development in the art of shipbuilding at any one time to lay down the characteristics of vessels to be laid down in a given time to bring the fleet up to its maximum strength. It is necessary to improve in design from year to year. Vessels laid down from year to year may differ in minor respects, but not in respect to power.

In view of the varying programs of the past, imposing upon us to-day the duty of making large expenditures to strengthen the Navy to make good past deficiencies, I submit to you, for transmission to Congress, a definite program of construction which not merely recommends a certain number of battleships

to be ready at a certain date, but specifies year by year the number to be begun and the amounts to be expended. The following is the program recommended, and I hope Congress will indorse it by so large a vote of its Members as to make certain its continuance by Congress to come:

	1917	1918	1919	1920	1921
Dreadnaughts.....	(2) \$15,500,000	(2) \$26,580,000	(2) \$37,600,000	(2) \$37,600,000	(2) \$37,600,000
Battle cruisers.....	(2) 11,158,000	11,921,000	(2) 17,500,000	(2) 17,118,500	(1) 23,460,500
Scout cruisers.....	(3) 6,900,000	(1) 6,350,000	(2) 10,000,000	(2) 8,650,000	(2) 10,000,000
Destroyers.....	(15) 10,500,000	(10) 16,900,000	(5) 10,000,000	(10) 10,300,000	(10) 13,600,000
Fleet submarines.....	(5) 4,425,000	(4) 5,577,300	(2) 5,437,500	(2) 4,215,000	(2) 3,400,000
Coast submarines.....	(25) 5,750,000	(15) 13,950,000	(15) 9,750,000	(15) 9,750,000	(15) 9,750,000
Gunboats.....	(2) 760,000	(1) 1,140,000	380,000	(1) 380,000
Hospital ships.....	(1) 1,250,000	1,200,000	(1) 790,587	(1) 1,766,000
Ammunition ships.....	(1) 700,000	655,250
Fuel-oil ships.....	700,000	(1) 655,250	(1) 1,175,000
Repair ship.....
Total.....	57,003,000	84,273,750	90,767,500	89,133,087	101,786,750
For completion of ships previously authorized.....	28,369,127	20,149,000
Total.....	85,372,127	104,422,750	90,767,500	89,133,087	101,786,750
Aviation.....	2,000,000	1,000,000	1,000,000	1,000,000	1,000,000
Reserve of munitions.....	8,000,000	5,000,000	5,000,000	5,000,000	2,000,000
Grand total..	95,372,127	110,422,750	96,767,500	95,133,087	104,786,750

Grand total for five years, \$502,482,214.

If this program is carried out, accepting the General Board estimates of survival for present vessels, the Navy would be composed of the following vessels, built or building, in 1921:

Battleships, first line.....	27
Battle cruisers.....	6
Battleships, second line.....	25
Armored cruisers.....	10
Scout cruisers.....	13
Cruisers, first class.....	5
Cruisers, second class.....	3
Cruisers, third class.....	10
Destroyers.....	108
Fleet submarines.....	18
Coast submarines.....	157
Monitors.....	6
Gunboats.....	20
Supply ships.....	4
Fuel ships.....	15
Transports.....	4
Tenders to torpedo vessels.....	3
Special types.....	8
Ammunition ships.....	2

In planning this program, involving for a number of years a greatly increased annual expenditure upon new construction, it became necessary to consider carefully its annual distribution.

The General Board was called upon for advice in this connection, and the department has accepted its recommendations as regards numbers of capital ships. As regards their distribution over a five-year period, it was concluded, in view of all the circumstances, that it would be best to make this as nearly uniform as might be. This course has obvious practical advantages, particularly in view of the present congested condition of the shipbuilding industry in this country. Moreover, since the maximum rate of expenditure upon the capital ships, which take some years to build in any case, will not be reached immediately, it enables us to concentrate more at first upon submarines and other quickly built craft, so that we will get earlier returns for our expenditure in the shape of completed vessels.

My recommendation of a five-year program embraces the same number as proposed by the General Board in the distribution it made in the five-year program of dreadnaughts, battle cruisers, scouts, and destroyers. I recommend 15 fleet submarines where the General Board recommends 9, and I recommend 85 coast submarines as against 58 recommended by the General Board. For additional reserve ammunition my recommendation is \$25,000,000, whereas the General Board recommends \$11,000,000. They recommend something more for other craft. My total for the five years is \$502,482,214. The General Board's total is \$499,876,000, a very slight difference for the five years, though the board's recommendation for the first year is much larger than the department's estimate.

As regards the battleships included in the program, the characteristics recommended for them by the General Board involved a very material increase in displacement over our previous battleships, which are themselves larger than those built or building by any other nation. While allowing in the program the estimated cost of these enormous vessels, the department has not finally approved them. As a definite determination of their exact characteristics is not necessary at this time and as to-morrow's developments abroad may require modifications of their characteristics, the department feels it necessary to give this question most careful investigation and consideration.

It will be observed that the proposed program for new construction includes a substantial number of battle cruisers and scouts. The former type has not hitherto been included in the estimates of the department or authorized by Congress. Of the latter, we have now upon the Navy list but three representatives, authorized April 27, 1904, and now out of date. It is believed that in the light of recent events it is necessary to expand the program to include these types of vessels if the Navy is to be prepared to meet contingencies certain to confront it in case of war.

In the early months of the present war the world witnessed a demonstration of what could be accomplished in the direction of commerce destruction by a limited number of small vessels operating in the open and deprived of shore bases for refueling, refitting, and refuge. The small, fast vessels of the German Navy thus engaged were able to overhaul merchantmen with ease, and at the same time to avoid for a considerable period the numerous vessels endeavoring to capture or destroy them. Three of the German cruisers eventually formed a junction with the *Scharnhorst* and *Gneisenau*, of the armored cruiser class, which may be considered the predecessor of the battle cruiser of to-day. An encounter off Coronel, Chile, November 1, 1914, between this small squadron and an inferior division of English vessels of earlier types, such as now exist in the United States Navy, ended disastrously for the English; but when two battle cruisers, with other vessels, encountered this same squadron at the Falkland Islands, December 8, 1914, the German ships found themselves unable to cope with the superior power and unable to escape from the superior speed of the battle cruisers. Moreover, the superior speed of the battle cruisers had much strategic value, in that it enabled them to reach with great promptness their field of action.

It is a notable fact that in every naval event of consequence which has occurred in the North Sea area the leading parts have been taken by vessels of the battle cruiser and scout types, and it is evident that had either side lacked such vessels it would have been at a disadvantage. When the battle-cruiser type was first brought out, it was argued that it could lie in the line with battleships and be used as a battleship upon occasion. Experience of the war, however, seems to indicate that their primary function will be in independent action, and that if a possible antagonist is possessed of any material number of vessels whose speed enables them to certainly elude the battleship, and which are so powerful that they need not apprehend torpedo craft, it is necessary to have the battle cruiser to cope with them.

While under the conditions of the part, attacks upon the over-seas merchant marine of the United States, in case of war, would have done little damage owing to its limited size, it is hoped that by the time these vessels are built our over-seas merchant marine will be more extensive. Apart from this it will be absolutely necessary in case of war to prevent the light, fast vessels of the enemy from committing depredations on the United States coast and destroying the auxiliary and supply vessels of the fleet.

In addition to the illuminating experience of the present war it may be pointed out that several times during the last year or 18 months' careful war maneuvers have been undertaken by the United States Navy for the purpose of

investigating its present capacity for defending this country against hostile attack. It is practically the unanimous opinion of the responsible officers who engaged in these maneuvers that for the defense in question an adequate supply of proper scouts is essential. Improvised scouts, such as destroyers, are not satisfactory. It is necessary that the scout should be a vessel designed for scouting duties and sufficiently large and robust to be able to do its work practically without regard to weather conditions.

In case of war, the country having the superior fleet will probably control the sea, but experience has demonstrated the fact that fast cruisers may keep the sea for an indefinite period, obtaining supplies and coal from captured merchantmen and in the meantime do an inestimable damage to the commerce and lines of communication of the country with the more powerful navy. Without fast cruisers of equal or greater power, both in speed and armament, the real control of the sea and protection to commerce and lines of communication can not be assured. In actual fleet operations, such a problem as must confront the United States in case of war with an over-seas enemy, the fast cruiser becomes the eyes of the fleet, to them the commander in chief must look for his information of the whereabouts and movements of the enemy's fleet; to insure success, our eyes must at least be equal if not superior to the eyes of the enemy; in other words, our fast cruisers must be equal to if not superior to those of the enemy.

Secretary DANIELS. In 1915, on January 25, I made an address to the War College at Newport, which you will find in the *New York World* of June 25, 1915, outlining the policy of the Secretary of the Navy toward large naval expansion, particularly urging that the naval officers should face new conditions in a new character of war and be ready to daringly go forward and to do whatever might be necessary to make the American Navy bold, audacious, and victorious. That article in the *World* is as follows:

DANIELS OUT FOR A GREAT NAVY OF MODERN CALIBER.

IN ADDRESS BEFORE WAR COLLEGE SECRETARY DANIELS DWELLS ON DEVELOPMENT OF SUBMARINES AND AIRCRAFT AND PLEADS THAT OUT-OF-DATE SHIPS AND METHODS BE DISCARDED FOR NEW.

NEWPORT, R. I., *June 26.*

In an address at the opening session of the Navy War College here to-day Secretary Daniels appealed to American naval officers to profit by the lessons being taught by the great war in Europe and to discard fearlessly all theories which fail to stand the acid test. He referred briefly to the Navy program for the coming year and expressed confidence that Congress would authorize any increase recommended.

"In personnel and material the Navy is larger than ever before," Mr. Daniels said. "Its men are trained and fit. Its experts in every department are active to remedy any defects of the past and take advantage of all that has been learned in the only true school in which this knowledge may be obtained, by observing through our experts in Europe all that may be learned from actual war.

OLD TACTICS DISAPPEARING.

"As you look abroad you see the foundation of old theories crumbling every day. Old tactics, old strategies, old theories of naval warfare which have stood unchallenged as almost axiomatic since the trilemes of Carthage and Rome grappled together in the Mediterranean are disappearing overnight.

"If war upon the land has reverted to the bayonet and the hand grenade, war upon the sea has leaped forward at a single stride and broken almost every shackle of ancient convention.

"We have seen the main fleet of the greatest sea Nation in the world withdrawn from the seas to some secluded harbor without having fired a shot during the first year of a mighty conflict. We have seen battles begun at ranges believed to be impossible and ships disabled by shots from guns as yet invisible. We have been told that modern sea fights would be determined in the first 10 minutes, yet we have seen that it took six hours to decide one of the greatest ocean battles of the present war. We have seen ships of shallow draft used as fortresses to protect land armies on the Belgian coast.

"We read only yesterday of submarines gliding unchallenged past the impregnable fortress of Gibraltar and the guardian ships that watch the straits. We have seen fast cruisers raiding the coast and eluding their pursuers by the help of dirigibles hovering far above and warning through the new miracle, wireless telegraphy, the ship beneath.

TERROR OF THE SUBMARINE.

"With what weapons, by what strategy, shall we meet the terror of the submarine; the still unrevealed possibilities of the airship? It is to you, gentlemen, that this question must be put. It is to you your Secretary of the Navy looks for an answer.

"My earnest word, my solemn plea, to-day is to urge you fearlessly to discard worship of all things that are old, and to adopt courageously anything that is new the moment that some development of the present convinces you that the old way is no longer the right way, or that the new way points to the path of victory.

"It is the courage of the American people in facing new conditions from the time our forefathers dared and mastered the terrors of the wilderness and built therein a new Nation with a new Government that has made us great to-day. Holding wisely to what is good in the past, to such principles as stand the acid test of this great war, do not fear to cast aside what have proved to be mere shackles of convention and daringly to go forward.

PLEDGES HIS ASSISTANCE.

"I hereby pledge myself to spare no effort to assist this onward march. Rest assured that what you plan will find a sympathetic and attentive ear.

"I want to feel that when my term of office closes my successor will find, in orderly arrangement, the most perfect plans and methods human wisdom can invent, kept always up to date, for the conduct of our Navy in time of war, and it is here that the studies necessary for such plans must be carried on."

The program for 48 battleships by 1919, he said, would have been carried out if all Congresses had been as liberal as the Sixty-third. He expected the next Congress to make liberal appropriations and further aid in the expansion by providing funds for weapons not now in existence.

Those who heard his speech interpreted it as a plea for great fleets of sea-going submarines and aerial craft.

On Monday, June 28, the New York World had the following editorial, which I will put in the record and I will read one paragraph:

"Mr. Daniels has seen in this fateful time 'old theories crumbling every day' and 'old tactics, old strategies disappearing overnight.'"

And they also added:

Reminding his hearers that "the courage of the American people in facing new conditions" has made the Nation great, Secretary Daniels meets the new conditions.

That speech I call your attention to is of the same tenor of urging new methods, discarding old tactics, that was much more ably and convincingly presented by the President in his speech in 1917.

In 1915 we were pressing and urging bold methods and the discarding of old methods.

(The editorial referred to is here printed in full in the record, as follows:)

[The World, Monday, June 28, 1915.]

A NAVY UP TO DATE.

Secretary Daniels's strong speech at the opening session of the Naval War College should satisfy those who have been his severest critics. It should displease no one except ultrapacifists, and 1915 is not their year for commending their policies to the public.

Mr. Daniels has seen in this fateful time "old theories crumbling every day" and "old tactics, old strategies disappearing overnight." He has seen great superdreadnaughts hiding in guarded havens while the unseen terror of the underseas ravages at distances hitherto deemed impossible. He has noted fast cruisers using hovering dirigibles as eyes to guide their raids on enemy coasts.

Reminding his hearers that "the courage of the American people in facing new conditions" has made the Nation great, Secretary Daniels meets the new conditions. He does not propose a Navy of menacing size, but a Navy up to date. To this end he has made arrangements for fuller use of the best expert thought within the department, without compromising the necessary safeguard of civilian control.

Next, to Mr. Bryan, Mr. Daniels has been the member of the President's Cabinet most often and most harshly criticized. Nothing in his conduct of the office has justified the abuse that has been wrecked upon him. If he successfully devotes himself to such modernization of the Navy as recent developments suggest, the need for which he so well states, he will disarm opposition by distinguished service.

Secretary DANIELS. So much has been stated here about dilatoriness, and the fact that the Navy and the Secretary of the Navy did not, after the sinking of the *Lusitania*, move as rapidly and as earnestly as possible to secure a greater Navy, and to put our Navy in condition for the day that came. I put in the record an article from the New York Herald of July, 1915, a statement which I made in July, 1915, to the New York World, an article in the New York World, dated July 25, headed "How Daniels and Garrison plan to build bigger Navy and Army—Four superdreadnaughts, 100 submarines, big fleet of destroyers, increase of 18,000 in personnel, and recognition by Congress of Edison inventors' board among proposals of Secretary of Navy," etc.

I also present an article from the San Francisco Call, the headlines being "Daniels is busy on plan for better Navy."

I present what the press said about the plans and policies in the spring of 1915. Similar articles appeared in almost every paper in the United States, telling the people that the Secretary of the Navy and the Navy Department were alert, energetic, active, doing all possible to create a stronger public sentiment, so that when Congress should take up the great recommendations made, there should be a public sentiment behind the recommendations that would justify Congress in the larger appropriations made; and as a matter of fact, when Congress did take up these recommendations, it was supported by public opinion in the drafting and passage of the great bill which they began to work on on the 1st of December, 1915, and enacted August 29, 1916.

(The newspaper articles last referred to are here printed in full in the record, as follows:)

DANIELS IS BUSY ON PLAN FOR BETTER NAVY.

[By International News Service.]

WASHINGTON, June 11.

Secretary of the Navy Daniels, Rear Admiral Benson (Chief of the Navy Staff), Rear Admiral Caldwell, and other officials began actively to-day to prepare for a greater Navy.

This activity in the Navy is intended to keep pace with the progressive movement of Secretary of War Garrison and his Army Staff. They will have plans ready soon for a greater Army.

The character of the work being done by both the Army and Navy heads indicates now that neither of the executive branches will be caught napping should there be an extra session of Congress.

Secretary Daniels said to-day that the chief topics of discussion were the types of cruisers to be on the construction program, the protection of battleships from torpedoes, and the best plans to secure a naval reserve.

The reserve is to consist of 25,000 additional men, who are to mostly former sailors of the Navy. The compensation for the Navy men who are enlisted will be in proportion to the length of their service as active sailors.

There seems to be no question that the construction program will include several battle cruisers, of which the United States has none on its list. The question of protecting warships, and especially battleships, from torpedoes is one of tremendous importance. With the development of this question it is promised by officials that there will be special attention paid to the development and improvement in all up-to-date essentials of the submarine service.

HOW DANIELS AND GARRISON PLAN TO BUILD BIGGER NAVY AND ARMY—FOUR SUPER-DREADNAUGHTS, 100 SUBMARINES, BIG FLEET OF DESTROYERS, INCREASE OF 18,000 IN PERSONNEL, AND RECOGNITION BY CONGRESS OF EDISON INVENTORS' BOARD AMONG PROPOSALS OF SECRETARY OF THE NAVY—WAR SECRETARY WANTS ARMY OF REGULARS AND MILITIA OF 410,000 MEN, RESERVE FORCE OF CITIZENS, EQUIPMENT FOR 1,000,000, MILITARY ACADEMY ON PACIFIC COAST, MORE BIG GUNS FOR COAST DEFENSE.

[Special to the World.]

WASHINGTON, July 25.

From authoritative sources the World has obtained a general outline of the reports that Secretary Daniels and Secretary Garrison will present to President Wilson regarding a definite program for a larger Navy and Army. It is upon these reports, as finally approved by the President, that the two Secretaries will base their estimates of expenditures which Congress will be asked to provide. The Navy program is:

1. The construction of at least four superdreadnaughts and probably two battle cruisers of the British *Queen Elizabeth* type. The United States Navy at the beginning of this year was 10 first-line ships behind the number required by the policy laid down by the Navy General Board in 1913.

2. The construction of a large number of destroyers. The Navy, on the basis of its present number of big ships, built and building, was 92 destroyers short of the complement determined upon by the General Board of four destroyers to each battleship. The Navy now has 40 battleships of all types and only 68 destroyers.

3. The construction of upward of 100 submarines, furnishing a complement of 50 for each coast.

4. The construction in the aeronautical base at Pensacola, Fla., of a plant for the construction of hydroaeroplanes, capable of turning out at least three machines a week, or as fast as officers can be trained to operate them.

5. Increase in enlistment authorizations to bring the enlisted personnel immediately up to the full strength for all ships, built and building, which might be utilized in time of war—an increase of about 18,000 men.

6. Enlargement of the capacity of the Naval Academy at Annapolis with a view of overcoming at the earliest possible moment the existing shortage of 900 officers, on the basis of the ships built and building, to say nothing of the needed increases through extensions in the aeronautical and submersible branches of the Naval Establishment.

7. Authorization for the expenditure of a large lump sum at the direction of the Secretary of the Navy, with a view of taking advantage of improvements and desirable innovations immediately upon their discovery.

8. Legislation giving the Board of Civilian Inventors, which Secretary Daniels recently created, a status before the law.

DANIELS TELLS THE WORLD OF PLANS TO IMPROVE NAVY.

By JOSEPHUS DANIELS, Secretary of the Navy.

[By telegraph to the editor of the World.]

MOREHEAD, N. C., July 25.

We are now studying what has been learned by the European war that will constitute the best guide for the larger naval program. The outstanding lessons are three:

1. The value of the submarine: The last Congress authorized twice as many submarines as any previous Congress and also authorized the building of three seagoing submarines larger than any nation has yet constructed. We are building one submarine in the navy yard at Portsmouth, N. H., and must build others in navy yards, thus securing competition between Government plants and private construction companies. We are expecting to get better batteries; two have already been ordered from Edison and will be shortly installed, one in an old and one in a new submarine. Naval experts and civilians are trying to improve the motors, which are now difficult to obtain. We are planning for new submarine bases ashore and for new tenders for submarines. The perfection of the submarine and the construction of a large number of additional ones may be said to be receiving most earnest consideration by naval experts and naval statesmen.

2. The European war has emphasized the value of aircraft as a naval aid. The last Congress recognized the importance of aircraft and gave us \$1,000,000 to begin a fleet of scouts in the air. We have established at the abandoned navy yard at Pensacola an aeroplane station with school for instruction and shops to repair machines, and the construction officers will soon have completed the plans for the construction of our aeroplanes at Pensacola. Important experiments are being made at the navy yard in Washington. I had made contracts to buy hydroaeroplanes in Germany and in France just before war was declared. These can not be secured now. But we have placed orders also with home companies and are buying all types that are suitable for our service made by American manufacturing concerns. Almost daily we are assigning young officers to the Pensacola school, so we will have trained men to fly in the new craft ordered.

3. The need of fast cruisers has been emphasized. The General Board and construction officers are now busy discussing the character of fast cruisers and battle cruisers. Our policy in the Navy hitherto has been to sacrifice speed to armor and guns. Now we see the need, if necessary, of sacrificing armor to speed. We must have ships that in heavy seas can make 40 knots. The types are yet to be determined upon.

These are the big things the big war has emphasized as the immediate need in our naval program.

Have we need to change our policy as to torpedo destroyers and dreadnaughts and armor? These are matters our ablest experts at home and abroad are studying and discussing. The General Board is holding daily sessions discussing these and other naval problems. The number of additional officers and men is under consideration. Until these studies are completed I can make no definite statement. It will be a program of progress and development along lines learned by experience.

MR. DANIELS SURE LARGER NAVY WILL RECEIVE SUPPORT—SECRETARY PREPARING PROGRAM RECOMMENDING INCREASES—SENTIMENT CHANGES IN CONGRESS.

[New York Herald.]

HERALD BUREAU,
Washington, D. C., Thursday.

Josephus Daniels, Secretary of the Navy, said to-day that he was preparing to recommend increases for a larger Navy in accordance with the program of the administration for a greater national defense without regard to the condition of the revenues of the United States. He is confident after sounding public opinion, that the people desire a larger navy and are willing to pay for it.

Mr. Daniels also let it be known that he will be ready to discuss a greater naval program with President Wilson by the middle of August, when he hopes the recommendations of the General Board will be in concrete form. He will urge the adoption of the program as the minimum for Congress to decide upon, hoping that the Senate and the House will see fit to increase it.

President Wilson, in calling for estimates from the members of the Cabinet, did not ask the Secretaries of the Navy and War Department to make them as low as possible, considering the revenues available. This, however, was done a year ago. The opinion prevails that in the question of national defense revenues should be of secondary consideration, within a reasonable figure, and that the increases required should be decided upon without regard for a sugar tariff, a war tax, and the like.

The General Board of the Navy, which usually goes to Newport in the summer, is in daily session here, close to Mr. Daniels, and there is reason to believe that the recommendations will be ready several weeks in advance of the usual time. Mr. Daniels hopes to have a general outline of the recommendations of the board when he takes the question up with the President, although he does not expect to have the full report until later.

How much of an increase in the Navy will be recommended is, of course, uncertain as yet, but the board's report, which always has been much larger than the building program approved by the Secretary of the Navy, is understood to stand a much better chance of acceptance this year than ever before. The guesses on the increased appropriations which will be asked range from \$50,000,000 to \$150,000,000.

Mr. Daniels has been sounding sentiment recently on the idea of a larger Navy, reading editorials from newspapers in the interior as well as the larger cities, and talking with Members of Congress who always stood for small naval appropriations, and is sure that the attitude is changing rapidly. Members of Congress who voted before for a single battleship, he found, now are willing to back large increases.

Secretary DANIELS. Early in the hearings, Mr. Chairman, I called attention to the fact that since March 5, 1913, the Navy Department had secured appropriations from Congress which have amounted to \$1,800,000,000 more than the total expenditures of the Navy during all the years since 1794, and that with all this large expenditure, amounting in full to \$5,825,299,944.74, there has never been in any paper in the United States, by any man in the United States, that I have ever seen, any statement that there was one dollar of any graft, or any favoritism, or any misappropriation. On the contrary, the business men of America, the large business men, who knew about war expenditures and war conditions, have given their opinion that the business side of the Navy was conducted in a manner to make it a model for the great business enterprises of America. I think it is a miracle, in view of the fact that the money must be spent promptly, that over \$5,000,000,000 should have gone through the hands of the Navy Department without a criticism.

The World War occasioned no reorganization of the Navy's supply system, the one object for years having been to work along the lines laid down by Secretary of War John C. Calhoun in his 1820 annual report.

The only difference between peace and war formation ought to be in magnitude, and the only change in passing from the former to the latter should consist in giving to it the augmentation which will then be necessary.

There was practically no change—simply expansion—and such outside help as was accepted by the Navy came because the Nation's total demands suddenly exceeded its supply of certain commodities, this necessitating centralized distribution.

In making Navy purchases, the principle of free and unrestricted competition among bona fide dealers was not departed from, bids being publicly opened throughout the war and each bidder having full knowledge of his competitors' offers.

The bidding list was increased from 6,000 to 18,000 firms. All brokers, speculators, and objectionable middlemen were effectually excluded. And, although the amount of supplies purchased by the Navy increased from a total of \$27,000,000 in the heaviest prewar year to \$30,000,000 in one single day, there was no delay or confusion, and nothing occurred like the Civil War scandals thus described by Secretary of the Navy Gideon Welles in his annual report for 1864 (just before the Supply Corps took charge):

Under the practice that has prevailed, the whole system has become tainted with demoralization and fraud by which the honest and fair dealer is too often driven from the market.

Money expenditures by the Navy from the outbreak of war to date totaled over \$4,193,000,000, or one and one-third times as much as had been previously expended during the entire 123 years since the Navy was founded (including four wars).

Although the enlisted force of the Navy suddenly expanded from a scant sixty-odd thousand to 500,000 men, there was at all times sufficient clothing of satisfactory quality available when needed.

To meet the war demand, the Navy increased temporarily its storage space at home by over 13,000,000 square feet.

Despite the scarcity of certain articles of food and the constant and persistent pressure from outside amounting in effect to actual propaganda for relaxation of the rigidity of the Navy's specifications—especially on meats—no such thing was done, and the standard of subsistence was never lowered.

The Navy subsisted satisfactorily more than 900,000 troops transported to France and another 1,200,000 returning.

Navy cost inspectors supervised work under contracts and commandeered orders amounting to over \$886,000,000 with a recorded saving to the Government of more than \$125,000,000.

Practically all American ships engaged in overseas service were fueled by the Navy, and, due to special storage and up-to-date bunkering facilities, sailing schedules were invariably adhered to.

Navy shipments overseas embraced 12,000 tons of gasoline, 130,000 tons of coal, 746,000 tons of fuel oil, and 1,200,000 tons of miscellaneous supplies, all of which were sent in pursuance of Supplies and Accounts intrabureau order 201, of July 26, 1917:

Requisitions, requests, and recommendations from Vice Admiral Sims, senior naval officer in command in Europe, are to be acted upon the same day they are received, and, unless there be some insurmountable obstacle, in exact agreement with his wishes; that is to say, when I properly have any discretion in the premises, it is to be understood that that discretion has already been exercised when Admiral Sims's wishes become known.

Advice of action taken will be immediately cabled to Admiral Sims in every case.

I am aware that, almost without exception, the foregoing rule has been in effect ever since Admiral Sims went abroad, but the necessity for instant action and unconditional support of everything that he does or wants to do is so obviously important that this order is issued to the end that immediate and favorable action may hereafter be invariable.

Mr. Chairman, I will not read any more of this set of documents, but will simply insert the balance in the record. It shows the work of the Bureau of Purchase and Supplies during the war.

NAVY DEPARTMENT.
BUREAU OF SUPPLIES AND ACCOUNTS.
Washington, D. C., March 31, 1920.

MEMORANDUM FOR THE SECRETARY OF THE NAVY.

The World War occasioned no reorganization of the Navy's supply system, the one object for years having been to work along the lines laid down by Secretary of War John C. Calhoun in his 1820 annual report:

"The only difference between peace and war formation ought to be in magnitude; and the only change in passing from the former to the latter should consist in giving to it the augmentation which will then be necessary."

There was practically no change—simply expansion—and such outside help as was accepted by the Navy came because the Nation's total demands suddenly exceeded its supply of certain commodities, this necessitating centralized distribution.

In making Navy purchases the principle of free and unrestricted competition among bona fide dealers was not departed from, bids being publicly opened throughout the war, and each bidder having full knowledge of his competitors' offers.

The bidding list was increased from 6,000 to 18,000 firms. All brokers, speculators, and objectionable middlemen were effectually excluded. And, although the amount of supplies purchased by the Navy increased from a total of \$27,000,000 in the heaviest prewar year to \$30,000,000 in one single day, there was no delay or confusion, and nothing occurred like the Civil War scandal thus described by Secretary of the Navy Gideon Welles in his annual report for 1864 (just before the supply corps took charge):

"Under the practice that has prevailed, the whole system has become tainted with demoralization and fraud, by which the honest and fair dealer is too often driven from the market."

Money expenditure by the Navy from the outbreak of the war to date totaled over \$4,193,000,000, or 1½ times as much as had been previously expended during the entire 123 years since the Navy was founded (including four wars).

Although the enlisted force of the Navy suddenly expanded from a scant sixty-odd thousand to over 500,000 men, there was at all times sufficient clothing of satisfactory quality available when needed.

To meet the war demand the Navy increased temporarily its storage space at home by over 13,000,000 square feet.

Despite the scarcity of certain articles of food and the constant and persistent pressure from outside, amounting in effect to actual propaganda for relaxation of the rigidity of the Navy's specifications—especially on meats—no such thing was done, and the standard of subsistence was never lowered.

The Navy subsisted satisfactorily more than 900,000 troops transported to France and another 1,200,000 returning.

Navy cost inspectors supervised work under contracts and commandeered orders amounting to over \$886,000,000 with a recorded saving to the Government of more than \$125,000,000.

Practically all American ships engaged in overseas service were fueled by the Navy; and, due to special storage and up-to-date bunkering facilities, sailing schedules were invariably adhered to.

Navy shipments overseas embraced 12,000 tons of gasoline, 130,000 tons of coal, 746,000 tons of fuel oil, and 1,200,000 tons of miscellaneous supplies, all of which were sent in pursuance of supplies and accounts intrabureau order 201 of July 26, 1917:

"Requisitions, requests, and recommendations from Vice Admiral Sims, senior naval officer in command in Europe, are to be acted upon the same day they are received and, unless there be some insurmountable obstacle, in exact agreement with his wishes; that is to say, when I properly have any discretion in the premises, it is to be understood that that discretion has already been exercised when Admiral Sims's become known.

"Advice of action taken will be immediately cabled to Admiral Sims in every case.

"I am aware that, almost without exception, the foregoing rule has been in effect ever since Admiral Sims went abroad; but the necessity for instant action and unconditional support of everything that he does or wants to do is so obviously important that this order is issued to the end that immediate and favorable action may hereafter be invariable."

The foregoing two pages of summarization are intended to show at a glance some of the principal things accomplished by and under the Bureau of Supplies and Accounts.

The succeeding pages of this memorandum will be devoted to a statement of the principal facts in somewhat more detail; a clearer understanding of the situation being afforded by reference to the following inclosures:

Standard stowage list.

Lists of provisions and general supplies for supply ships.

Form of standard stock catalogue.

Standard clothing list.

Standard provision lists.

Form used for recording facilities and capacities of mills for turning out articles needed for Navy use.

Index of subjects contained in logistics report dated 31 March, 1916.

Index of subject contained in logistics report dated 31 March, 1917.

Chart showing organization of the Bureau of Supplies and Accounts before the war.

Chart showing organization of the Bureau of Supplies and Accounts at the signing of the armistice.

Statement of purchases under the Bureau of Supplies and Accounts during the fiscal years 1914 and 1917.

Analysis of total expenditures for the fiscal years 1913 and 1917.

In order that the scope of this work may be appreciated, it is necessary to indicate the relations of Supplies and Accounts to the other bureaus and offices of the Navy Department. The Navy has had since 1889 a centralized system by which Supplies and Accounts purchases the stocks of all supplies, materials, and equipage that are required to make the vessels of the fleet habitable and manageable; also the materials and supplies necessary for the mechanical and laboring forces at navy yards and stations; the stocks of fuel oil and gasoline; all clothing, provisions, and canteen supplies; navigational instruments; building materials and practically all materials for ordnance. These purchases are made on specifications prepared or approved by the particular bureaus of the department which are to use them and will ultimately pay therefor out of the appropriations made for each bureau by Congress. The materials are inspected either at the works of the contractor or at the navy yard by an inspector under the cognizance of the bureau concerned, in order that it may be fully satisfied that the quality is according to the specifications which the bureau originally prepared.

The deliveries are made to the supply department of the navy yard, and there inspected, stored, held for issue by requisitions submitted by the head of the yard department or by vessels of the fleet, and shipments made to other yards and stations. The supply department also accounts for all stores received, issued, and on hand. The accounting department keeps track of the time and job and cost of work upon which every mechanic and laborer in the navy yard is employed. The disbursing department pays off the yard working force and also pays public bills for deliveries made.

There is, therefore, a series of checks all along the line—the supply department keeps the stock; the hull or engineering department inspects it as to quality and quantity; and the disbursing department pays for it.

At each navy yard and station—whether industrial or nonindustrial—the work of the yard in the building or repair of the vessels of the fleet is divided between several departments, hull, engineering, public works, and supply departments, each department spending money out of funds allotted to it for specific purposes by the bureau having cognizance of the appropriation.

The supply officer is responsible for the maintenance of the vast run of miscellaneous fleet supplies, materials and equipage, clothing, provisions, fuel, and the like.

Special articles not carried in stock, such as machine tools, explosives, ordnance, or special articles of equipage, such as radio equipment, boats and the like, are obtained on requisitions and specifications prepared by the head of the yard department or in the bureau concerned—in any event the requisitions

must be approved by the chief of the bureau against whose appropriations the value of the stores when purchased or issued will be charged.

This indicates in a brief way the coupling up of the user and payer for an article with the purchaser and custodian thereof in the Navy Department organization.

It follows logically that every increase or decrease in an activity under the material bureaus of Ordnance, Construction and Repair, Steam Engineering, and Yards and Docks is felt and reflected in or under Supplies and Accounts; and similarly, to a lesser degree, the same fact applies to the Bureaus of Medicine and Surgery and Navigation and to Operations.

RESERVE STOCK.

It was realized in 1915 that the stocks primarily of Navy standard items were too low. As a business proposition, the turning over of capital invested in material four times each year was an excellent showing; but from a military point of view it was wholly inadvisable and dangerous, for the simple reason that stocks could not be replenished quickly when an abnormal condition existed with respect to the ordinary laws of supply and demand, which was to be expected when all industrial plants were called upon to manufacture munitions for the Government—shortage of labor, congestion in transportation, shortage of fuel and raw materials—all necessitated the accumulation of a reserve stock for military purposes to carry over until the time industry could be fully organized.

This led the Paymaster General of the Navy to issue instructions December 21, 1915, in part as follows:

"The commandant is requested to please direct the supply officer, when in replenishing stock of all actively-moving Navy standard articles, to so increase the quantities of such items as will be sufficient to maintain at all times a six months' reserve stock—the reserve stock, therefore, of any article to be the quantity in addition to the quantity which would be sufficient to complete the fitting out of all vessels—in active service and in reserve—and to provide probable repairs thereto, for which each yard is the home port.

"The foregoing instructions are not intended to modify in any way the maintenance of stock for such articles as boiler tubes, structural steel, special treatment steel, and other items concerning which previous specific instructions have been issued. The stocks of such articles are to be maintained under the instructions now in force. The foregoing list of items as quoted from the letter of the General Board is illustrative only, and was intended to show the general scope of the increases to be made in the stock of naval supply account. The increase, of course, should not be made in items which deteriorate readily or are liable to become obsolete. Care should also be taken in increasing the stocks on hand to give preference to articles difficult to purchase or requiring time to obtain delivery.

"As stated in the foregoing, the increases in stock should be not more than can be accommodated with present storage facilities."

An effort was made to limit the reserve stock to the requirements for six months; but in many instances stocks had to be ordered a full year in advance, such as brass and copper rods, sheets, tubes, etc.—this by reason of the fact that all mills turning out composition products were taxed to the utmost with orders from abroad.

STORAGE FACILITIES.

A study of storage facilities was then undertaken. All of the primary outfitting yards—Boston, New York, Philadelphia, Norfolk, Mare Island, and Puget Sound being so overtaxed to accommodate the then stocks on hand that but little increase or accumulation of reserve material could reasonably be expected. Plans for temporary structures were prepared and designs adopted, so that the work could be taken in hand immediately after the funds therefor were made available.

MAXIMUM STORAGE CAPACITY OF VESSELS OF THE FLEET.

Under date of January 11, 1916, the following letter was sent to the commanders in chief of the Atlantic and Pacific active and reserve fleets:

"There are forwarded herewith mimeograph copies of a tabulated list showing the maximum storage capacity of the ships of the different fleets. It is the intention to ultimately have these lists printed and distributed to all

ships, navy yards and stations, in order that everyone concerned may know exactly what quantities of supplies of all kinds can be accommodated by the various ships of the Navy, and particularly that outfitting yards may have dependable figures in this respect for accumulating sufficient quantities of provisions and stores, as indicated.

"It is deemed expedient, however, to request that careful consideration be given the figures contained in this list in so far as they pertain to the ships under your command, with a view to reconciling manifest disparities in the quantities of supplies that sister ships indicate that they can stow. For instance, it will be noted that whereas the *New York* can carry 180 days' naval supply account stock, her sister ship, the *Texas*, states that she can carry 210 days of such supplies; and vice versa, whereas the *Texas* can stow but 150 days' dry stores and the *New York* can stow 180 days, it may be that there are inherent differences in the construction of the storerooms of these ships, or that some other material reason makes it impossible for them to carry identical quantities of supplies. It is believed, however, that it will be found in some instances that these disparities can be eliminated; and that sister ships can accommodate exactly the same quantities of supplies.

"With that end in view, it is desired that copies of this list be distributed to the vessels under your command, with such instructions as you may deem proper to have any inaccuracies which may be found to exist properly corrected. After sufficient time has elapsed for all ships under your command to report to you any corrections to be made in the figures, it is desired that one list be returned here, showing in red ink all the corrections that you desire to have made before this list is finally printed.

"As it is desired to have this list printed at the first possible moment, anything that can be done toward expediting the return of the corrected list will be greatly appreciated."

CARGO LISTS.

Lists of provisions and general supplies for supply ships were then prepared, as shown in inclosure B, C, and D, all of which are self-explanatory.

ARTICLE IMPORTED FROM ABROAD.

While our country produced practically all items within itself or could provide substitutes therefor, there were a number of important items required in connection with Navy work which were imported only from abroad; and intensive studies were conducted with respect to the supplies of tin, sodium nitrate, shellac, kapok, dyes, cork, flax, etc.

STANDARD STOCK.

In order to avoid the danger of accumulating stocks liable to become obsolete a Standard Stock Catalogue was prepared. This catalogue covers all items of supplies and materials necessary to meet the ordinary requirements of ships and manufacturing departments at yards and stations. It was not intended for any single yard nor for ships alone nor for the exclusive use of the manufacturing departments—it being a catalogue for the whole Navy. The use of the catalogue has resulted in standardizing material and eliminating the carrying of a large variety of sizes—the diameter of a screw or the thickness of a sheet of metal to be used for a specific purpose having been to some extent a matter of individual selection and it frequently happened that material not carried in stock was specified in drawings or called for on ships' requisitions because information as to the material regularly carried in stock was not readily obtainable; but, with the Standard Stock Catalogue in the planning sections and drafting rooms of every manufacturing department and in the supply department of every ship, as well as in every supply department on shore, coordination was possible with a maximum of efficiency in supplying adequate stores for the Navy without unnecessary waste. Inclosure E will indicate the form used. The Standard Stock Catalogue is now a volume 4 inches thick.

CLOTHING.

The policy with respect to clothing is set forth in the following letter from the Paymaster General of the Navy to the provisions and clothing depot, New York, dated March 7, 1916:

"It is desired for military and economic reasons to more uniformly administer the supply of clothing and small stores both afloat and ashore. To this end,

it would seem to be advisable to fix a time-limit quantity to be carried on board ship and at the depot.

"Except for a negligible few, the ships of the fleets can carry at least six months' clothing; whereas a great many can carry an even larger supply. There does not appear to be any good reason why all ships should not carry clothing to last the same length of time. If a few ships carry a year's supply while others have but half that quantity, there would not appear to be any advantage accruing to the ships as a fleet unit by reason of the greater carrying capacity of a few vessels; whereas when the supply gives out on a majority of the ships, we need a supply ship to replenish them; and the fact that a few ships are still sufficient unto themselves will not alter the circumstances.

"Therefore, why not have them all fitted out for the same length of time and then we will know exactly what quantity it will require to replenish a fleet after it has left port and exactly when a new supply will be needed.

"This refers, of course, to articles of clothing only and not to small stores or other small articles such as buttons, braid, rating badges, sewing thread, etc., of which—on account of the small space occupied—all ships can readily carry a year's supply.

"If instructions are issued, therefore, that all vessels (expected to cruise with the fleet) in fitting out for sea shall take a six months' supply of clothing—the articles being enumerated—and one year's stock of small stores and other small items not included in the six months' list, much time will be saved and confusion avoided if the fleet is suddenly mobilized.

"The question which now arises is as to the stocks which should be maintained ashore and as to the points at which these stocks should be maintained.

"As it is always practicable to foresee the needs for clothing and small stores, particularly if the above outlined plan is carried out, there would seem to be no reason why emergency requisitions should ever be necessary; and it is thought that the best results might be obtained by carrying clothing and small stores in stock at three yards only—New York, Mare Island, and Cavite—requisitions from ships being forwarded sufficiently in advance to the distributing yard to permit of shipment to the home yard by the time the clothing and small stores are needed.

"By thus pooling the stocks at three yards, an undue accumulation of odd sizes will be avoided, losses by deterioration of inactive stock minimized and more definite information at all times as to exactly how the Navy stands with regard to its clothing supply will be at hand.

"It is understood, of course, that the question of insufficient storage space at New York might preclude the possibility of such a plan; so, before any steps are taken toward putting it into operation, comment and recommendation with regard to the entire situation and in particular respect to whether or not the provisions and clothing depot would be able to handle the increased stock, are requested.

"In this connection attention is invited to the following, which is quoted from Supplies and Accounts, June 24 Quarterly Logistic Report:

"The present stocks of clothing are based on a supply sufficient for the needs of about 50,000 men, and the probabilities are that the Naval Militia will be already equipped with sufficient clothing. It is intended that the initial requirements for the 100,000 men shall be met first by pooling the stocks on hand at all depots ashore and afloat and by increasing quantities of raw materials considerably larger than the stocks it has been customary to carry in the past, within the limit, of course, of the funds available in time of peace. The demands for various articles comprising the outfit of clothing will depend very largely upon the theater of operations, for if in West Indian waters the great demand will be for white clothing and light underwear. During the Spanish war the fleet operations occurred during the summer, and large quantities of light underwear, white jumpers, trousers, and hats were in demand. No special effort was made then to procure large quantities of other items of clothing; and it is believed that the requirements for the enlisted personnel were then met and without complaint.

"It would appear advisable, therefore, to limit the clothing outfits to underwear, socks, shoes, shirts, trousers (blue and white), and jerseys. The stocks of cotton drill, blue cloth, blue flannel, lining materials, etc., will be materially increased as far as funds will permit, as above stated. Furthermore, each ship will be required to report the total issues of each item of clothing during the

previous period of three months in order that it can be determined what excess stocks are on hand, and it is confidently believed that the stocks, if pooled in this manner, will, together with the increase in raw materials, be almost sufficient to supply the ordinary demands of 100,000 men.

"The clothing factories will, of course, be worked to their maximum capacities, and in case they are unable to turn out such additional quantities of clothing which may be needed and which may not be on hand after providing for the pooling of stocks as above stated, it is the intention to make up a standard outfit of blues and whites and to forward them to the large manufacturers of men's clothing in order that their facilities for turning out outfits if needed can be determined.

"Shoes on special lasts require a comparatively long period of time to manufacture and recourse would be had to either dividing the contracts among several large shoe manufacturers or to purchase from the very considerable local stocks conforming to the Navy standard as closely as possible such additional quantities as may be needed.

"In the event of a campaign in the Atlantic, practically all stocks of clothing at the west coast stations will be ordered shipped, when war is imminent, to the navy yard, New York. With reference to increasing the supply of raw materials, however, this will be rendered difficult to accomplish because of the very meager stock of indigo and alizarin dyes in the United States at the present time. Practically all of these dyes are manufactured in Germany and it appears next to impossible to obtain any from that source within the near future.

"The dye condition is a serious menace to the continued use of navy blue as a color for uniforms, and this condition will invariably exist in case trade with the usual source of supply is interrupted as at present, providing, of course, local industries fail to take up the manufacture of these dyes to supply domestic demands. Under present conditions, to increase largely the stock of blue material, it would be necessary to use an inferior substitute or change to some other color.

"It is particularly requested that consideration of this question be given and a reply to this letter be made at the earliest convenience of the officer in charge."

The foregoing resulted in the preparation of standard clothing lists, as per inclosure F; and this was followed by standard provision lists, as per inclosures B, G, H, and I, which are self-explanatory.

FUEL AND TRANSPORTATION.

Studies were then commenced of the storage facilities necessary for the supply of fuel, and its transportation, for the fleet, whether operating off home bases or at distant points abroad. Standard time charter parties and bare ship charters were prepared, the commercial facilities of all ports—both at home and as many abroad as possible—being inquired into; names and capacities of mines producing Navy standard coal were listed and approved, and plans laid for the establishment of the following coaling depots, with the storage stated opposite each:

	Coal.	Fuel oil.	Gasoline.		Coal.	Fuel oil.	Gasoline.
	<i>Tons.</i>	<i>Barrels.</i>	<i>Gallons.</i>		<i>Tons.</i>	<i>Barrels.</i>	<i>Gallons.</i>
Portsmouth.....	12,000			Norfolk.....		734,000	90,000
Boston.....	10,000	50,000	90,000	Sewalls Point.....	300,000		
South Boston.....	75,000			Newport News.....	300,000		
Melville.....	45,000	203,000	90,000	Charleston.....	93,000	34,000	90,000
New York.....	9,000			Key West.....	13,000	34,000	180,000
Constable Hook.....	250,000			Guantanamo.....	21,000	355,000	90,000
Philadelphia.....	60,000			Panama Canal.....	100,000	42,000	
Baltimore.....	60,000						

Plans were prepared for the procurement of coal barges, water barges, ash lighters, and side-coaling devices, and a thorough and complete index made of the reports submitted by the Board of Inspection and Survey as to merchant ships which could be readily converted into colliers, tankers, supply ships, cargo vessels, and the like.

MOBILIZATION OF RESOURCES.

An investigation was instituted during 1915 and 1916 as to the facilities of the various mills, factories, and manufacturers of the United States for producing the things that would be needed and the capacities of the mills to turn them out; and inclosure J will indicate the form of the record maintained for this purpose. The plan contemplated the classification of manufacturers into inspection districts and for reports to be obtained directly by the inspector of engineering or hull or ordnance material in charge of each district. This work was of tremendous volume, as can readily be realized; and when this country was finally drawn into the war the demands of the Army and the Navy were so great as to necessitate their being coupled up with industry—the first step toward which was the creation of the General Munitions Board and later the War Industries Board, the work of which, with its commodity section organization plan, proved of such conspicuous value during the war.

In order to provide for the proper coordination of the work of Supplies and Accounts with that of the other bureaus of the Navy Department, the logistics committee was created July 7, 1916. This committee consisted of representatives officially designated by the Chiefs of the Bureaus of Construction and Repair, Steam Engineering, Ordnance, Yards and Docks, Medicine and Surgery, and the Chief of the Bureau of Supplies and Accounts, as such, acting as chairman.

It was the duty of the logistics committee to: "(b) Determine the initial requirements as to fuel, clothing, food, and supplies of all kinds, and the probable requirements for subsequent plans of the war; (c) ascertain the sources of supply of such material, amounts available, and times necessary for delivery; (d) make detailed plans for the purchase, delivery, inspection, and shipment of fuel, clothing, food, and other supplies."

The records of the committee were kept in the logistics section of Supplies and Accounts. The value of the work of this committee was mentioned in the logistics report of the Paymaster General of the Navy to the Chief of Naval Operations, under date of September 30, 1916, in part as follows:

"Though the work of the committee is actually done by the representatives of the several individual bureaus, it centers here, and is so closely connected with the activities of the Supplies and Accounts that it is considered not unfitting that the work accomplished should be briefly commented upon in this report.

"The committee has prepared and adopted a uniform source-of-supply card. It has further definitely decided exactly how this card is to be handled. The plan laid down will prevent the duplication of inquiries which has existed to some extent in the past. It has been decided to use for every article a guide card which will show as accurately as possible the initial and subsequent requirements for that material; these guides to be filed with the source-of-supply cards, thus making it easy to see at a glance both the demand and the supply for any particular item.

"As soon as all requirements are thus determined, it will be practicable to intelligently decide wherein the reserve stocks already obtained can most advantageously be augmented and also what other articles should be added to our military reserve. This question of reserve stocks has, on account of its close relation to storage facilities, necessarily been considered in conjunction with the latter subject, and the logistics committee has been and is giving careful thought to the matter of additional buildings for housing such supplies at all fitting-out yards, favorable recommendations having already been made in the case of Philadelphia and Norfolk.

"The Standard Stock Catalogue is proving to be a very valuable help to the logistics committee, which is now getting up additional information to be incorporated in the catalogue to furnish in this manner detailed instructions for the proper stowage of certain materials which are subject to rapid deterioration if not properly stored, or else are liable to be provocative of accidents which might result seriously. As this information concerning the particular requirements at various yards is required, the catalogue will be corrected.

"The committee has gone on record as being in favor of obtaining annual appropriations to cover the purchase of reserve machinery and equipment that would be most urgently needed in case of war. Naval Supply Account could be used to purchase any supplies needed for the Navy; but, if materials are purchased thereunder and then deteriorate before being used, the current ap-

appropriations concerned would be charged with the value of such supplies. If such materials are purchased for purely war needs, some provision must be made to meet this prospective obligation. It appears that the current appropriations may not be expected to meet the obligation; hence special appropriations for the purpose seem desirable.

"Attention is also being given to those necessary articles that are procured abroad with a view to ascertaining requirements as soon as possible, and then getting the material, or, if possible, determining upon satisfactory domestic substitute.

"Copies of the minutes of the three meetings of the permanent logistics committee—held, respectively, August 4, August 31, and September 2^d, 1916—are transmitted herewith as Exhibits 6, 7, and 8.

"The Paymaster General can not properly close this report without inviting special attention to the manner in which the permanent logistics committee got under way.

"The order of July 31 said:

"The committee will carry on," and almost from the moment the members first assembled it was obvious that there had been devised the means of solving a great many more or less vexed questions, particularly in the line of possible overlapping and duplication of effort.

"As will be seen from the accompanying copies of the minutes of the three

harmony. By reason of this, and judging from the spirit of cheerful cooperation invariably exhibited by the representatives of all of the bureaus concerned, the interbureau permanent logistics committee gives promise of progressively valuable work toward accomplishing real preparedness."

An idea as to the scope of the work performed by S and A in the preparation of the plans for war may be gained from Inclosure "K," which is an index of the subjects contained in the Logistics Report, dated March 31, 1916, and Inclosure "L," an index of the Logistics Report of March 31, 1917, hereto attached.

So much for the preparations that were made in advance of actual hostilities.

When war was declared the personnel of S. and A. consisted of 10 officers and 125 clerks.

The organization was: Transportation Division, Fuel and Logistics Division, Purchase Division, Fleet Division, Disbursing Division, Accounting Division.

The system of purchase had been established; the system of stores, their receipt, care, and issue had been in vogue, with a constant effort year by year to improve the efficiency of the centralized supply system; the accounting system had been in operation for several years, and the disbursing system had been simplified. So, when war was declared, activities along all lines were quickened as if by a magic touch. The Navy at once prepared to meet the supreme test for which it was created and all forces were bent upon getting into the strife and winning the war in short order. Expansion on a wide and elaborate plan was necessary. Bases had to be established, storehouses built or rented, and materials manufactured—involving transportation of raw materials, as well as the finished product, over congested railroad lines in our own country and through a sea beset by submarines and strewn with mines to reach the bases abroad.

TRANSPORTATION DIVISION.

Two divisions were established to handle shipment matters and solve the various transportation problems as they arose. First, the Overseas Transportation Division, with an officer of the Regular Navy in charge, to handle transoceanic shipments, and, second, the Inland Traffic Division, with an officer of the Railroad Administration in charge, to handle domestic freight.

Over 1,000,000 tons of Navy cargo were shipped abroad with practically no loss at sea. There was a gradual increase of tonnage from 3,000 tons in May, 1917, to 142,921 tons in September, 1918, when the high-water mark, so far as overseas shipments were concerned, was reached. The mine project in the North Sea alone required over 83,000 tons of material.

The directions with reference to the handling of this vast quantity of stores were issued by the Overseas Division. During the loading operations the officer in charge was in constant touch both day and night with the yard at

which vessels were loading, in order to be able to adjust any matters which might arise and tend to delay sailings. Vessels were loaded with the utmost dispatch. Frequently cargoes were placed on board at New York, Philadelphia, and Norfolk in from two to four days. The material transported consisted of an indefinite variety of articles, including delicate instruments and wireless apparatus; bulky items, such as aeroplanes and boats, as well as provisions and munitions.

All requests for shipments were acted upon promptly, however, those received from the fighting forces at the front being given preference in accordance with the specific directions of the Paymaster General in the following intrabureau order issued July 26, 1917:

"Requisitions, requests, and recommendations from Vice Admiral Sims, senior naval officer in command in Europe, are to be acted upon the same day they are received and, unless there be some insurmountable obstacle, in exact agreement with his wishes; that is to say, when I properly have any discretion in the premises, it is to be understood that that discretion has already been exercised when Admiral Sims's wishes become known."

When it is recalled that there were few overseas shipments on account of the Navy previous to the outbreak of hostilities, and that rail movements increased about 1,500 to 2,000 per cent, the difficulties to be overcome in expanding, without rupture, to meet the new conditions are obvious.

Numerous and urgent requests were received from contractors and Government officials to have car equipment furnished, to have shipments expedited and to have embargoes removed, all of which were promptly acted upon by inland traffic, in conjunction with the Railroad Administration, when necessary.

Prior to the taking over of the railroads by the Government, it was clearly evident that unless special measures were adopted there would be serious delays in transporting Navy matériel and completing the Navy building program, owing to rail freight congestion. At that time the roads to the Atlantic terminals were clogged with tonnage primarily intended for this Government and the Governments allied against the Central Powers; and it was with great difficulty that prompt movements of consignments in which the Navy was interested, including those between contractors, were obtained.

This led to the development of what was designated as the "Navy shipping envelope," in which the waybill or car card was placed. The use of this envelope, which was of special design and clearly indicated to the railroad employees the Navy's interests in the consignment, resulted in lessening the delays in delivery. This shipping envelope was later adopted by the War Department and the United States Shipping Board and was an important contributing factor toward expediting transportation of munitions and supplies.

As the war progressed the transportation problem became more acute. With a view to surrounding the movement of matériel and supplies for the Navy and Navy contractors with every possible safeguard for prompt dispatch, representatives were placed in the principal eastern and middle western cities where congestion was heaviest. These representatives were known as field traffic officers, and it was their duty to cooperate with the railroad officials in an effort to keep Navy freight moving freely through the congested sections and to expedite through their districts matériel urgently needed.

Weekly reports submitted by the field traffic officers, indicating activities regarding transportation difficulties met with, as affecting Navy shipments, enabled the Navy to foresee and prepare the necessary details for moving its freight expeditiously.

At the same time, attention was given by this division to new lines, better delivering facilities at the primary yards and stations, notably at Mare Island, Calif.; New Orleans, La.; and Norfolk, Va. The White Plains and Indian Head extension, permitting the forwarding of freight for the proving ground direct by rail instead of through the Washington yard and thence by barge to destination, was started during hostilities and recently completed.

In addition to the movement of material and supplies action was taken to transport the necessary workmen to and from certain yards in order to carry out the various activities, as it was impossible for these men to obtain living quarters in close proximity to the yards. Arrangements were made with the Railroad Administration for special trains, known as "labor specials," to carry these men, part of the expense of the operation thereof being defrayed from Navy appropriation.

The following appropriations for freight were made by Congress for the fiscal years 1917-18 and 1919:

1917:	
Act Aug. 29, 1916	\$725, 000. 00
1917-18:	
Act Mar. 4, 1917	850, 000. 00
Act June 15, 1917	1, 750, 000. 00
Deficiency act Feb. 25, 1919	4, 578, 200. 12
	7, 178, 200. 12
1919:	
Act Jan. 7, 1918	4, 000, 000. 00
Deficiency act Feb. 25, 1919	10, 000, 000. 00
	14, 000, 000. 00
Total	21, 903, 200. 12

FUEL AND LOGISTICS DIVISION.

Commandeering of tankers.—Upon the outbreak of hostilities it became necessary for the Navy to secure additional tank vessels in order to meet the needs of naval forces operating overseas, the Navy tankers *Kanawha*, *Cuyama*, and *Maumee* being entirely inadequate to meet the demands for shipment of fuel oil and gasoline.

It was practically impossible to secure tankers by ordinary means, even at the prevailing commercial rate of from 240s. to 300s. per ton for voyages between United States port and United Kingdom or French Atlantic ports. These rates were based upon the owners assuming all war-risk insurance, both for steamer and cargo.

On June 2, 1917, after much negotiation, the following tentative rates were proposed to the Navy:

From one North Atlantic port to one port in United Kingdom or one French Atlantic port: Fuel oil, 100s. per ton per cargo, intake weight; naphtha, 100s. per ton per cargo, intake weight.

If loaded at one United States Gulf port, for same destination: Fuel oil, 120s. per ton per cargo, intake weight; naphtha, 122s. per ton per cargo, intake weight.

The foregoing rates would apply only to voyage on the steamer covered, and would be subject to bimonthly revision.

The foregoing rates were deemed excessive, it being believed that a rate of \$4.25 per dead-weight ton per month on a time-charter basis would be a fair charter rate. This rate was determined as follows, based on a 7,000-ton steamer, the cost per vessel to owners at \$100 per ton:

Crew's wages	\$78, 000
Provisions, engine and deck, supplies, water	30, 000
Management and consulting engineer	8, 000
Small repairs, boiler cleaning, etc	12, 000
Dry-docking, general hull and machinery repairing, survey, etc	15, 000
	141, 000
Marine insurance, 8 per cent	58, 000
Depreciation, 6 per cent	42, 000
Interest on outlay, 5 per cent	44, 850
	283, 850
Profit, 6 per cent	42, 000
Per annum	325, 850

Allowing one month annually for dry-docking, repairs, survey, etc., about \$4.25 per dead-weight ton monthly plus war risk.

On July 21, 1917, the following vessels were commandeered, after due investigation as to the ability of the owners to furnish without detriment to

their commercial trade or to shipments they were making for account of allied Governments:

Vessel.	Cargo capacity.	Owner.
	<i>Tons.</i>	
Standard Arrow.....	12,500	Standard Oil Co. of New York.
Rayo.....	5,200	Do.
Gargoyle.....	8,500	Vacuum Oil Co.
William Rockefeller.....	9,700	Standard Oil Co. of New Jersey.
Topila.....	7,000	Southern Pacific (Associated Oil Co.).
Los Angeles.....	11,000	Union Oil Co.
Gold Shell.....	7,600	Shell Co.

Time charters were made for these vessels at a tentative rate of \$4.25 per dead-weight ton per month, subsequently changed to a permanent rate of \$4.15 per dead-weight ton per month, in accordance with advice received from the United States Shipping Board that this rate had been determined as equitable and in accordance with their authority by law to establish rates (act June 15, 1917). The tanker *Rayo* was employed for a brief period pending delivery of the *Standard Arrow*. Tankers subsequently chartered for the Navy were obtained through the United States Shipping Board, all on a time charter basis at the rate of \$4.15 per dead-weight ton per month.

The rate of 100 shillings per ton quoted to the Navy on a trip basis would amount to about \$15.70 per dead-weight ton per month on a time charter basis. Based on the length of time each vessel commandeered was employed, the Navy effected a saving of approximately \$9,000,000.

Purchases of fuel during period April 1, 1917, to July 1, 1919.—Fuel in the following quantities was purchased during the period April 1, 1917, to July 1, 1919, for all naval purposes, both ashore and afloat:

Coal.....	tons..	7,500,893
Fuel oil.....	barrels..	15,428,490
Gas oil.....	do.....	103,811
Distillate.....	gallons..	605,773
Gasoline.....	do.....	25,067,675

A complete survey was made of the coal and petroleum industry, covering output, cost of production, demands for essential war industries, and requirements for allied powers. Based on this investigation, Navy orders were placed with the different suppliers for deliveries on an advanced-payment basis, final prices being left for later determination. The ultimate fixed prices were established after exhaustive inquiries made by various governmental agencies into operating and transportation costs, fluctuations in miners' wages, etc.

Shipments of fuel overseas.—The following shipments of fuel were made overseas during the period April 1, 1917, to July 1, 1919:

France:	Tons.	Mediterranean:	Tons.
Coal.....	62,174.00	Coal.....	9,853.00
Fuel oil.....	140,670.24	Fuel oil.....	11,545.24
England:		Azores and Bermuda:	
Coal.....	4,909.00	Coal.....	79,894.00
Fuel oil.....	511,778.65	Fuel oil.....	66,175.59
Motor gasoline.....	2,939.49	Motor gasoline.....	6,891.20
Aviation gasoline.....	1,115.00		

The appropriations by Congress for fuel for the Navy during the war were:

Act Aug. 29, 1916, fuel and transportation, 1917.....	\$5,000,000
Act Mar. 4, 1917, fuel and transportation, 1917-18.....	6,500,000
Deficiency act June 15, 1918, fuel and transportation, 1917-18.....	19,362,420
Act July 1, 1918, fuel and transportation, 1919.....	49,400,000

Total..... 80,262,420

PURCHASE DIVISION.

"The Navy took them over, and the Navy brought them back."

This is something of the inside story of how it was done. Approximately 550,000 officers and men were required for that work. In the Purchase Division

of Supplies and Accounts, a little over 500 officers, yeomen, yeomen (F), stenographers, clerks, and messengers fed, clothed, and equipped those 500,000 men. The Purchase Division supplied the ships with all their needs from bread, butter, and jam to kapok mattresses, sounding tubes, binoculars, lifeboats, and rafts. The Purchase Division bought submarine chasers for the patrol of the seas and the material for the construction of destroyers.

Almost insurmountable difficulties were encountered in getting food that was scarce, machinery, and highly technical material; resort was made to every method known or that could be devised, asking, appealing, demanding bids in personal conferences or by carefully written urgent letters, telephone, or telegraph; but the goods were obtained eventually and they were available when needed.

It was predicted early in the war that victory would be won by supplies, defeat forced by the lack of supplies; and it was on this fundamental principle that the Purchase Division worked. Each and every individual was made to feel by the officer in charge a personal responsibility to do all in his or her power to shorten and to win the war.

The secret of its success.—The secret of the success of the Navy's purchasing system lies in its lack of secrecy.

It was maintained that "things must not only be right, but look right," and to this end the public was afforded the fullest opportunity to assure itself that Navy purchasing was being conducted on this principle.

The Navy's preparation.—At the beginning of the war the warehouses of the Navy were not only well stocked but there were in the possession of the Purchase Division comprehensive statements of prospective and specifically calculated needs of supplies. For a year or more before the United States entered the war, every provision was being made to meet that contingency. Quickly and without comment, except within itself, the Navy undertook the preparation of the most exhaustive logistics probably ever prepared by the Government. This investigation embraced every important industrial establishment in the United States, a statistical report of what it manufactured, its normal daily capacity, its possible capacity working under pressure three shifts a day, its present number of employees, the approximate number it might employ if worked to its capacity, and what expansion might be made in its line of production. With this information down in black and white, calculation was made of how much production might be obtained from this or that factory, what the delivery ought to be and where every needed article could be bought. Approximate inventory was then taken of stock on hand at every navy yard and on board every ship, and estimate made of the probable supply of stock that navy yard or ship would need immediately in the event that war was declared. Some of these statements were retained in the Purchase Division; others were sent in sealed communications to the navy yards and ships. Instructions were given that these statements were only to be opened after the declaration of war. So it was that, in the hour the President declared a state of war existed between America and Germany, these envelopes were unsealed and there was laid out before the administrative officers a full and comprehensive plan of procedure. There was a complete statement as to the supplies to be carried aboard ships and in the yards' warehouses. If these supplies were not available the Purchase Division's reports showed where they could be obtained immediately. No time was wasted; the Navy was enabled to get right down to business, because it had its objective in view. The working out of plans had been started a year or more before the declaration of war; they were completed, or practically completed, not more than a few days before the presidential announcement came. That factor is principally responsible for the ease with which the Navy obtained its needed materials.

With the work so well laid out, the needs clearly defined, purposes well established, with the proper spirit and with the earnestness and industry which the Purchase Division possessed, supplies were bought, business was greatly increased, and the organization expanded from 28 people to over 500. And through it all the machinery ran smoothly.

The Naval Committee of the House of Representatives, at the end of a long and tediously minute investigation into the preparations for the great conflict, said:

"The Bureau of Supplies and Accounts has established and well deserves a nation-wide reputation for efficiency."

High lights on Navy business.—The Purchase Division places over 99 per cent of total number of contracts made by the Navy Department; buys all ma-

terials, with but few minor exceptions; has over 18,000 names on its mailing list. During the war it increased its personnel from 28 to over 500; handled an average of 624 requisitions a day from June 30, 1917, to November 11, 1918 (average in prewar times about 100 per day); entered into over 18,500 contracts; issued over 6,200 Navy orders (commandeering); increased its business from total of \$27,000,000 during fiscal year 1915-16 to over \$500,000,000 during 1917-18; purchased over \$30,000,000 worth of supplies in a single day; purchased approximately \$70,000,000 worth of supplies in August, 1918; purchased approximately \$40,000,000 worth of copper; purchased \$15,599,791.20 worth of blankets; purchased \$1,022,800 worth of corned beef in a single contract; purchased \$55,078,957.84 worth of T. N. T., \$12,900,000 of which was under a single contract; spent a grand total of \$873,544,947.78 for supplies. After the armistice it reduced its personnel approximately one-third from November 11 to January 1; made a further reduction to less than 170 at end of fiscal year; canceled 1,299 contracts; canceled 835 contracts without liability to Government, value of cancellations without liability to Government, \$23,830,163.23; canceled 194 contracts with liability (total value of above 194 contracts, \$23,681,849.16); paid for cancellation \$3,215,642.93; adjusted 5,820 Navy orders; has handled an average of 378 requisitions per day; total value of schedules and requisitions canceled after bids had been obtained, but before award was made \$57,148,487.89; realized \$4,985,618.16 from sale of surplus, abandoned, and condemned materials from December 1, 1918, to June 30, 1919; transferred material between navy yards to amount of \$7,312,296.

At the beginning of the war, the Navy had a total strength of 64,000 officers and men; at the signing of the armistice, it approximated 550,000.

In taking care of its greatly increased force, the Purchase Division employed the same methods and followed the same principles that it had followed for many years previous.

"To innovate is not to reform," said Edmund Burke. The administrative machinery was the same in the purchase of \$70,000,000 worth of supplies in a month as in the purchase of \$5,000,000. Expansion of the existing system was so logically brought about that the new ideas arising from necessity were, as a matter of course, easily followed, easily understood, and in no sense conflicting with old methods.

One of the first needs to make itself felt was a division of work into clearly defined lines and limits in order that there might be uniformity of procedure, harmony of action, and centralized authority in these little "states" or sections.

The following sections were created: Requisition, schedule, mimeograph and printing, specifications, mailing list, emergency purchase, award, contract, legal.

A glance at the above visualizes the steps taken from the receipt of a requisition to the placing of the contract and the adjustment of any legal problems which may arise thereafter.

In order, however, that the requisition may be approved for purchase in the manner calculated to bring about the best results, to secure the greatest competition, the cheapest price and the quickest delivery, and in order that the award may be made to the person offering the most satisfactory material, as judged from the positive knowledge of the technicist, the following "material" sections were established with a civilian expert or officer having an expert knowledge of that commodity at the head of each: Steel, chemical, nonferrous metals, lumber, textile (later subdivided into woolen goods, cotton goods, and clothing), provisions, hardware and small tools, ordnance material, automotive (aeroplanes and motor cars), optical glass.

In addition to the commodity sections, the following sections were formed for the purpose of handling special matters under their cognizance: Navy order (to take care of commandeering), open purchase (for the supervision of local purchases authorized at the navy yards), stock upkeep (to maintain a standard stock at the yards), salvage and sales (to dispose of or utilize excess materials, abandoned or obsolete), correspondence section.

Personnel.—The purchasing personnel expanded from 28 to over 500, approximately one-sixth of this number being officers and the remainder equally divided between enlisted and civilian employees. The civilian experts in charge of commodity sections were not dollar-a-year men, but gave their experience and broad knowledge to the Navy at salaries greatly reduced from their earning capacity in civil life and not nearly commensurate with their ability. Their connection with the Navy has been aptly termed by the Paymaster General as "outside talent with inside control."

The principles of Navy purchasing and official procedure were detailed and discussed in weekly conferences held by the officer in charge of the Purchase Division and frequently attended by the Paymaster General, at which the entire administrative force was present. A report of each conference was afterwards mimeographed and distributed to every employee. In this way newcomers became familiar with the well-defined work of each section of this large and rapidly growing organization.

Expansion of business.—The following table shows in detail the amazing expansion of business during the war and the gradual resumption of a peace-time status after the armistice—another instance where money talks:

	Value of bureau orders.	Value of Navy orders.	Value of contracts.	Total value of contracts, Navy orders and bureau orders.
1917.				
April.....				\$25,457,770.66
May.....				30,070,295.84
June.....				35,152,189.53
July.....	\$9,251.15	\$2,501,863.10	\$42,408,863.97	44,920,078.22
August.....	4,059.47	3,313,589.15	47,559,267.14	50,876,895.76
September.....	11,250.46	3,823,044.84	23,915,277.48	27,749,572.78
October.....	12,262.28	6,166,618.74	46,068,986.38	52,237,867.40
November.....	13,056.60	11,150,159.55	23,240,159.75	34,403,375.90

The first step toward purchase.—The first step toward a purchase is the preparation of a requisition by the ship, yard, or bureau which is in need of the material mentioned, the requisition definitely stating the use to which the material will be put. Every requisition is forwarded to the requisition section of the Purchase Division, which determines how purchase shall be made. It may be made either by the Purchase Division under its regular printed forms by the receipt of mailed proposals, or it may be made by the emergency purchase section, where, in case of urgent need, time is not taken to prepare and mail proposal blanks, but bids are obtained by telegraph or telephone, or it may be made at the discretion of the officer in charge of the requisition section, by the supply officer of the local navy yard concerned.

Before the war the average number of requisitions handled was about 100 per day. The total number of requisitions received and acted upon during the fiscal year 1919 was 140,249—63,070 were handled before November 11 (the date of the armistice), or an average of 3,710 per week, or 624 per day; 77,179 were handled from November 11 to January 30, an average of 2,205 per week, or 378 per day. While the above figures show that immediately upon the signing of the armistice the volume of purchases was tremendously decreased, the amount still being received is more than 300 per cent above prewar conditions.

The method of obtaining bids—Classified mailing list.—Prior to the war the Purchase Division maintained a mailing list of 12,000 names. During the war this list was expanded to over 18,000 names. To these firms was sent each week a "Notice of proposed purchases," which described the material, the quantity required, stated the schedule number under which proposals were to be ob-

tained, and the date bids were to be opened. This notice of proposed purchases was also used for the dissemination of information of a general nature, Government rulings, regulations of different governmental war organizations, etc.

The mailing-list section was established at the very outset of the war for the purpose of classifying material and manufacturers in order that proposal blanks might be forwarded to all prospective bidders in advance of the date set for the opening of bids. These proposal blanks state the quantity required, specifications for the material, conditions of delivery, special instructions as to packing and shipping, and, in fact, all the information needed to prepare bids. The Purchase Division undertook to actually place these schedule blanks in the hands of interested manufacturers, a great convenience to the bidder and a benefit also to the Government. As a result broader competition has been obtained; between 20 and 50 bids are frequently received on a single item.

The classified mailing list covers about 15,000 items, and listed under each item are the names of all manufacturers or dealers who are in a position to bid on that material.

Firms have not been placed on this list simply because they are known to manufacture or sell the kind of material specified. A card is first sent to each concern requesting information as to the exact nature of its business, whether it is a partnership, if so, the names of the partners, if a company or a corporation, the names of the officers and their official position, the location of branch offices and their managers, factory address, location of warehouses, and a complete list of all material manufactured or dealt in. If the information furnished is satisfactory and the concern stands well in its particular industry, it is then placed on the mailing list to receive all future schedules for supplies in its line of production.

Rush work.—Formerly all schedules were printed by the Government Printing Office; but, when war supplies were needed, it was impossible for the forms to be printed. A mimeograph section was thereupon established, by means of which schedules were prepared in the Purchase Division, distributed, and sent out within 24 hours. These rush schedules were distinguished from material needed for stock and for which there was no particular hurry by adding "one-half" to the schedule number.

Materials in any degree special for actual war use, such as for munitions, submarine chasers, chemicals, and steel were covered by the half-numbered schedules and proposal blanks were sent only to a limited list of the most reliable firms. Anybody might come to the public counter inside the "open door" and obtain proposal blanks of even-numbered schedules. A request for the half-numbered schedules however had to be approved by the commanding officer or the chief clerk.

The open door.—The space set aside for the public was inside the much-talked-of "open door." During the war when the danger of spies was ever present, this was the only door in the Navy Department through which entrance might be gained without an official pass. A large space was inclosed by tall, broad counters upon which were placed the record books of the office and several clerks were assigned to the duty of furnishing any information which the interested public might desire.

The reading and recording of the bids received at a single opening frequently required the exclusive attention of half a dozen people for an entire day. As many as 400 bidders quoted on one day's opening, which might cover from 50 to 80 schedules, each schedule containing from 1 to 20 classes and each class anywhere from to 50 items. A single class sometimes contained over 100 items for such material as drills in different types and sizes.

The emergency purchase section.—Primarily the most important function of the emergency section was to cooperate closely with the fleet abroad and at home and to act immediately upon all requests from Admiral Sims. Except in cases involving special material which had been designed and perfected by only one concern in the United States, and the requisition for which had been approved by the Secretary of the Navy for direct purchase from that firm, competition was obtained on emergency purchases as broadly and fully as on regularly scheduled purchases. While emergency purchases were given a schedule number of the designation 900—for filing and identification purposes—schedules were not actually prepared but a description of the material incorporated in a letter, or more often a telegram, and sent to all reliable firms. An opening date was set as in the cases of regular schedules, except that it was not limited as to hour or date and bids were requested by telegraph, it being usually impossible to give more than two or three days for their preparation

and submission. In the most urgent cases where quotations had to be obtained by long-distance telephone, firms in a position to bid would be telephoned to for quotations and the regular procedure followed in making award to the lowest satisfactory bidder.

In one instance, a ship bound for Europe sent a radio that certain boiler tubes were damaged and that she would be compelled to return to port the following day for repairs. This information was relayed to Washington, the material located in New York, delivered the same day by auto truck to Philadelphia, and the tubes were awaiting the ship upon her arrival the following morning.

Open purchases.—The amount of purchases which the supply officer of a navy yard or station can make locally is limited and usually covers materials or services for which there is an unexpected need or which, in case of materials, are ordinarily not carried in stock. The open purchase section of the Purchase Division exercises administrative supervision over all such purchases. Except in cases of purchases of minor importance the bids are forwarded by the supply officers to the Purchase Division for examination and approval; and by this method uniformity of action and adherence to the Navy's purchasing principles are maintained.

Navy order.—A two fold responsibility rested upon the Purchase Division, in that it must not only obtain the necessary materials but at fair and just prices.

When reasonable bids could not be obtained through competition, resort was had to a Navy order, which was a form adopted for use in exercising the commandeering authority which was vested in the heads of the Government departments by act of Congress. This method of obtaining material was generally necessary where the law of supply and demand was no longer applicable. The order was, however, used more often for the obtaining of materials where price could not be determined at the time of its issue; i. e., it simply served to secure the required services of material pending cost investigation or other method of arriving at the just compensation to be paid therefor. The order is mandatory upon the recipient and must be accepted and filled regardless of the question of price. Pending the fixing of a final price, a tentative payment was provided for which would at least reimburse a contractor for his costs.

Price fixing.—Besides investigations conducted by the Navy's cost inspectors at manufacturing plants, final prices were frequently fixed by the General Price Fixing Committee of the War Industries Board, the Food Administration of the Food Purchase Board. The Federal Trade Commission also conducted exhaustive investigations into the costs of production of various materials and its reports were of invaluable assistance to the Navy and the price-fixing agencies of the Government. Where commodities were seized from stock, price therefore was generally reached by agreement with the owner; but, where this method failed, the price fixed by the Navy was based on such cost data as was available. The use of the Navy order had a marked effect upon the market, tending to prevent inflated prices and the hoarding of materials which were needed for war purposes.

In this connection, it is interesting to note that a very considerable quantity of machinery, tools, and other needed materials held in warehouses along the Atlantic coast for overseas shipment, in many instances undoubtedly for enemy interests, were seized through use of this order. Information as to the value and location of such stocks was received from customs officials at the ports and war intelligence sources. Lists of the materials were made and forwarded to the Navy Board for Commandeering, which was established in New York City. Where materials were likely to be needed, the Purchase Division immediately issued restraining orders on the firms in whose names the material was being held to hold the stock subject to the Navy's further order.

This was not in effect a commandeering order, but merely for the purpose of preventing the shipment or other disposition of the material until it could be ascertained whether it was required for naval purposes. To obtain full and complete information on this point, lists of the articles were sent broadcast to all supply officers of navy yards and stations for their inspection and report as to what material was needed. If the material was required, a formal commandeering order was issued; if not, it was released. The possession of this large quantity of material already manufactured greatly relieved the pressure on an already overtaxed manufacturing situation.

Price fixing or price control was exercised by the Navy or other Government agencies acting under the authority conferred upon them by the President in

connection with the following: Acetate of lime; alcohol; aluminum; binder twine; cotton lintors; canvas; cement; hemp; hides; iron ore; iron and steel bars, shapes, etc.; lead; lumber; manganese; meats; mercury; mica; monel metal; nickel; nitrate of soda; coal; coke; copper; electrical conductor cable; fuel oil; flour; fruits, tinned (and all other foodstuffs); pig iron; platinum; rails; rubber; sugar; sulphur; tin; toluol; vegetables; wire rope, steel; wool; zinc.

An interesting instance of the actual seizure of food was in January, 1918, when 42,000,000 pounds of beans, which had become very scarce in this country, were commandeered by radio before the ship reached port in California, this being a joint Army and Navy action. The sale of these beans had been contracted for to private interests, and title would therefore have passed upon the docking of the vessel at a United States port. Due to foresight, however, and prompt action, this food was secured for our Army and Navy.

While the mandatory power was exercised with the greatest discretion and care to see that the seller was equitably treated, there is no doubt that it exerted a far-reaching moral effect on industries and on the market.

The high cost of living.—The problem of the high cost of living confronted the Navy as well as our citizens. The Navy order, however, was every effective as a restraining influence on the price of foodstuffs, the bulk of its provisions being obtained in that manner. While market prices were abnormally high and a scarcity existed in many articles of the Navy ration, the Purchase Division was able to secure at all times every needed kind of food, there being always maintained several months' supply to meet service contingencies.

Comparative prices of Navy purchases.—The following is a small list of widely varied supplies purchased by the Navy, showing comparative prices during 1916, 1917, and 1918:

	1916	1917	1918
Binnacles, Type VII.....	\$295.00	\$364.00	\$395.00
Biscuits, tinned..... per pound..	.079	.1547	.14
Blankets.....	4.40	6.40	7.81
Cement, Portland..... per pound..	1.47	1.39	1.75
Chair, barber.....	42.25	44.00	47.50
Circles, azimuth..... do.....	45.00	62.50	45.00
Clay, fire..... per ton.....	8.25	9.25	12.00
Extinguishers, fire..... each.....	12.18	12.50	12.64
Ferrules, rubber..... do.....	.04	.0475	.035
Glycerine..... per gallon.....	5.237	6.995	6.4925
Lard substitute..... per pound..	.1715	.225	.2375
Lye..... do.....	.0773	.0725	.0725
Neckerchief..... each.....	1.12	1.12	1.23
Oakum, spun..... per pound.....	1.697	1.625	1.55
Oil, rapeseed..... per barrel.....	.90	1.90	2.25
Packing, flax..... per pound.....	.5075	.65	.78
Packing, rubber..... do.....	.96	1.06	1.09
Paint, aluminum..... per gallon.....	3.05	3.75	3.80
Pork, salt..... per pound.....	.15	.2787	.2557
Rice..... do.....	.0335	.0688	.0739
Sausages..... do.....	.3186	.3338	.3942
Sheeting..... per yard.....	.2968	.40	.53
Shells, afterbody..... each.....	75.00	75.00	75.00
Shoes, high..... per pair.....	3.89	4.83	6.36
Soap, salt water..... per pound.....	.058	.059	.0765
Socks, cotton..... per pair.....	.19	.1975	.23
Spyglasses..... do.....	11.75	14.80	14.50
Stadimeters..... each.....	130.00	138.00	130.00
Stands, music..... do.....	1.00	1.50	.81
Stretcher, splint..... do.....	25.00	24.00	16.90
Sugar..... per pound.....	.064	.0765	.087906
Sulphur..... per ton.....	24.11	30.51	55.00
Sand, carborundum..... do.....	62.42	77.30	75.46
Hose, fire..... per foot.....	.481	.74	.84
Tachometers..... each.....	50.00	57.50	56.00
Tea..... per pound.....	.20	.33	.27
Tubes, sounding..... each.....	.15	.19	.23
Ticking..... per yard.....	.18	.30	.43
Salt..... per pound.....	.06	.08	.10
Varnish, asphaltum..... per gallon.....	.36	.58	.45
Varnish, damar..... do.....	1.037	1.19	1.50
Varnish, mixing..... do.....	.68	.71	.76
Varnish, interior..... do.....	.932	1.00	1.125
Varnish, spar..... do.....	.936	1.25	1.50
Tin, phosphor, ingot..... per pound..	.55	.57	.81

Wool and canvas problems.—Early in the war, wool was scarce and of inferior grade; and where the Navy was to obtain the quantity necessary to meet its requirements in order to maintain the high standard of its cloth and at the same time prevent undue rise in the market was a perplexing problem. The use of shoddy or reworked wool was considered undesirable; Navy needs must be met with specification woolen material.

Negotiations were entered into with the British Government which resulted in the purchase of 25,000 bales of high-grade Australian wool. The price agreed upon was the same as that charged by the British Government to its own manufacturers of military garments and was practically based on cost. Due to having this quantity of raw wool on hand, the Purchase Division in its next schedules for woolen goods requested the bidders to state their prices to manufacture the cloth under two conditions, i. e., they to furnish the wool or the Government to furnish it. The fact that the Government could furnish it and at a decreased price had a pronounced influence on the quotations submitted by the manufacturers for the finished cloth and resulted in prices much lower than otherwise could have been obtained, this being particularly true where the bidder offered to supply the wool himself, and most of the contracts were based on this arrangement. Owing to the beneficial results so obtained, the Navy later purchased an additional quantity of wool which was more than sufficient to meet all subsequent requirements during the war.

This wool was also used in the manufacture of specially heavy woolen clothing, at a cost of \$3,000,000, for use by men on destroyers operating in the North Sea or areas where they were subjected to very cold weather. The Navy manufactured the greater part of its clothing in its own factories, blue uniforms being manufactured at the clothing factory, fleet supply base, South Brooklyn, N. Y., and white uniforms at the navy yard, Charleston, S. C. Some contracts were made, however, with contractors for the assembling and sewing of garments, the Navy furnishing the material already cut to pattern for that purpose. Sufficient clothing was always on hand to meet the rapidly growing requirements of the Navy, there being July 30, 1918, a sufficient quantity of garments of every kind to meet the needs for a period of six months to a year.

The Navy spent \$15,599,791.20 for blankets alone; and there never was at any time a shortage of this article.

Owing to the limited manufacturing facilities in the country for the production of canvas, a shortage was foreseen; and as early as August, 1917, 10,000,000 yards of this material were contracted for by the Purchasing Division. But for this wise action early in the war, there would not have been sufficient stocks to meet the subsequent heavy demands for this material.

Supplying essential needs in copper, tin, and other nonferrous metals.—War needs early necessitated a Nonferrous Metals Section to handle the purchasing of shells, cartridge cases, brass and copper tubes, powder tanks, rotating bands, submarine nets, steel-wire rope, tin, copper, zinc, lead, and cement, and other important items. Copper was the most important metal entering into the manufacture of these essential materials, and it was evident that the production of this metal was not sufficient to meet all demands. Therefore, April 6, 1917, a contract was drawn with the copper industry for 20,000,000 pounds of copper at \$0.166739 per pound, the market even at this time having rapidly and steadily advanced to a point where this price was exceptionally advantageous as compared with a market price during a period of its use of approximately 30 cents per pound. Requirements of manufacturers for copper to be used in finished products were met by the Navy, resulting not only in a saving in price, but insuring early delivery—a factor of the greatest importance. Between April 6, 1917, and November 11, 1918, 200,000,000 pounds of copper were purchased by the Navy. Early in the war copper prices were reached by agreement with representatives of the industry; later the price was fixed by the price-fixing committee of the War Industries Board.

Technical experts in the Nonferrous Metals Section rendered the most valuable assistance in the study of trade and market conditions, in the preparation of statistics as to the production and consumption of materials with relation to the needs of the United States, the location of available material, transportation problems, and the maintenance of sufficient stores. While most of the nonferrous metals and materials in the production of which they were necessary were obtained after open competition, in some instances it was necessary to exercise commandeering powers.

The commandeering of tin in the early part of 1918 furnishes an interesting example of the benefits obtained through this power. Though the market

price was unreasonably high, tin was scarcely obtainable and investigation disclosed the fact that large stocks of tin were being held by brokers with the evident purpose of further inflating the market. The Navy, therefore, issued blanket commandeering orders to numerous firms covering all tin in their possession. Where it could be shown that the tin so commandeered was intended for war purposes, it was released. The major part of it was, however, distributed to the Army and Navy contractors, particularly the shipbuilding concerns who were in urgent need of this metal for different purposes in connection with construction of destroyers and other vessels.

The Navy's action also resulted in an increased supply, holders—through fear of commandeering—placing their stocks upon the market and at prices much lower than had prevailed for some time previous.

The story of steel.—Owing to the enormous demand for iron and steel products, it was early evident that the steel industry would be taxed to the utmost, and that only by the most careful placing of orders with a view to the maximum of output could the war requirements be met. A steel section was, therefore, formed under the direction of a civilian expert, later commissioned a lieutenant commander in the Reserve force. This section acted in an advisory capacity with respect to all questions relating to the purchase of iron and steel products, chain, machine tools, cranes, railroad equipment, locomotives, and cars.

Immediately after the declaration of war in April an agreement was made with the United States Steel Corporation for 300,000 tons of various rolled-steel material at prices much below the prevailing market. This material took care of the immediate needs of the Navy; subsequently, however, the War Industries Board found it desirable to form a steel commodity section in order to properly distribute the supply to meet the requirements of the Government and the Allies. The chairman of this section was known as the director of steel supply, who handled the allocation of orders to the manufacturers. The steel section of the Purchase Division worked in close harmony with the corresponding commodity section of the War Industries Board, and the Navy's requirements were fully provided for at all times.

All requests for steel commodities were passed upon by the steel section, which specified the method by which materials were to be obtained, either by purchase or by allocation.

One of the most trying situations early confronting the Navy was with respect to the shortage of plants for providing large forgings, particularly for destroyer shafting. Available plants were being taxed to their full capacity to supply the large quantity of such shafting necessary, incident to the destroyer building program.

Another proposition of paramount importance in this connection was where to obtain the heavy machine tools needed for the manufacture of these heavy shafts and of large-caliber guns.

In an effort to develop new sources of supply, a joint investigation into the cost and processes of manufacture of destroyer shafts was made by representatives of the Bureau of Steam Engineering and the Purchase Division of Supplies and Accounts. This investigation resulted in a plan to build and equip three new forging plants, using open-hearth steel furnaces and equipped with their own machinery and heat-treating facilities, the plants to be operated under the management of experienced manufacturers. A fourth plant already projected by another manufacturer was also promptly accepted on the same conditions and placed in operation. This plan did not involve the establishment of new companies but the financing by the Navy of additions to plants already in existence and producing similar material. In making these arrangements it was agreed that after a certain profit had been realized on output the manufacturers were either to buy outright the plant additions which had been erected by the Navy or else the Navy might take the removable portion of the plant, machinery, equipment, etc., for utilization at the navy yards. The erection of these plants was commenced October 17, 1917, at which time appropriations were made available. The first came into operation three months later; the second, a little over four months later; the third, the largest and most complete of its kind in the United States, representing an expenditure of \$6,000,000 and equipped with entirely special machinery made during the period of the construction of the plant, was completed within less than seven months. The fourth plant, in connection with which the Navy only rendered assistance, was ready for operation within eight months. With the completion of these plants, the production of de

stroyer shafting became a matter of mechanical possibility and reality. This was a large and highly successful business undertaking on the part of the Navy.

The Steel Section initiated the purchase of a quantity of unusual material, such as structural steel for wireless towers in France, 14-inch railway mounts, and 7-inch tractor mounts. This section also prepared Navy orders to the value of \$11,000,000.

Chemicals and explosives.—It was not only for the production of steel that the Navy was forced to finance and build new plants, but also for explosives, of which there would have otherwise been an acute shortage. These additions were made to existing explosive plants, and the projects, which ran into millions, were initiated by the Chemical Section under the direction of a civilian expert, later commissioned a lieutenant commander in the Naval Reserve Force. The major items handled were explosives, propellants, such as trinitrotoluol, ammonium picrate, and smokeless and black powder, also coke, acids, and alkalis.

About 700,000 pounds of trinitrotoluol were purchased monthly up to January, 1918; and just before the signing of the armistice production had been increased to 1,700,000 pounds and was fast approaching 2,000,000 pounds monthly. The Navy's purchases of trinitrotoluol alone amounted to over \$55,000,000.

The development of trinitroxylol, which was used as a substitute for trinitrotoluol, and particularly as a mine filler, greatly augmented the available supply of high explosives.

During the year 1917 there was a greatly diminished mining of cinnabar (the principal ore of mercury). Previous to this period the American product could not be produced at a cost comparable with that of Spain, because of higher labor costs and the low percentage of mercury in the ore. Therefore, most of America's requirements had been imported. Our urgent war needs, however, demanded local production, and the Government fixed a price therefor which would allow local producers their costs plus a reasonable profit. The results were very satisfactory, and production increased from 16,485 flasks in 1914 to 33,351 flasks in 1918, in which year the country was supplying its total demands from local production. Because the Purchase Division had been instrumental in increasing production, it handled all the requirements of the war and other Government departments for mercury.

Negotiations with the British Government for a supply of mica were also conducted by the Chemical Section, and all Government agencies obtained their requirements of mica through this section. This mica was furnished by Great Britain at the same prices as quoted British consumers.

Other important commodities the purchase or procuring of which was handled by this section included paints, pigments, varnishes, kapok, hemp, coal-tar products, ferro alloys, and such chemicals as entered into the manufacture of explosives or signal rockets, which latter article played a most important part in the Navy's successful warfare against enemy submarines. Certain of these materials were purchased through allocation by the War Industries Board, others after competition in the market.

Lumber.—The demand for lumber for use in the construction of boats and aeroplanes constantly increased up to the signing of the armistice. A civilian of many years of experience in the lumber business and thoroughly familiar with conditions in that industry, was placed in charge of a lumber section. At no time did the Navy lack an ample supply of lumber of the grades desired; and lumber inspections during war times remained as rigid as during peace times.

Aeroplane spruce was one of the most vital needs and much more difficult to secure than other kinds of lumber. Its production was limited and the prices for the better grades excessive. The Navy being unable through the usual channels to get a sufficient quantity of satisfactory grade, the lumber section in close cooperation with the Bureau of Construction and Repair took action toward directly procuring this material. Navy representatives were sent to New England, which up to this time had not been a source of supply, to personally interview the leading manufacturers of spruce timber; and agreement was reached as to specifications and methods to be used in the milling of this spruce on a cost-plus basis. Formal contracts were drawn direct with these manufacturers, and the first month's operation netted a production of 1,500,000 feet. The prices paid were comparatively low, grade A being obtained at \$125 per thousand feet, grade B \$110, and grade C \$100 per thousand feet; whereas this material had been formerly obtained from western manufacturers at prices ranging as high as \$643.80 per thousand feet for

grade A, \$350 for grade B, and \$186 per thousand feet for grade C. The use of New England spruce was especially desirable because of the accessibility of this section to eastern manufacturers of aeroplanes and the short hauls involved in delivery; and its use in the construction of Navy planes proved most satisfactory. The British Government purchased 1,000,000 feet, later entering into contract for 3,000,000 feet additional, with the option of increasing this quantity to 6,000,000 feet.

The North Sea mine barrage.—In order to transport our troops to Europe and provide for their maintenance, it was incumbent upon the Navy to take every possible step to curtail the U-boat menace. The Bureau of Ordnance, therefore, conceived the plan of laying a mine barrage across the North Sea to debar the progress of the German submarines from their bases in that locality into the channels of commerce. This was a project of the greatest magnitude, and the Purchase Division was instrumental in obtaining the material for the mines. An officer of the Purchase Division was assigned to this work, which was his exclusive duty. Time was such a vital factor that, in company with representatives of the Bureau of Ordnance, he proceeded to plants in a position to manufacture the mines and arrangements for their special production and transportation to the seaboard were effected.

One hundred and twenty-five thousand complete mines were purchased at an approximate cost of \$40,000,000, for which 182 contracts were issued. All of the material entering into the manufacture of these mines was purchased after competition, where practicable; and, as secrecy was essential in connection with the entire project, bids were opened only in the presence of interested bidders and records kept in special books, which were not available to the public, although the procedure governing competitive bidding was zealously guarded.

These mines were a new commercial proposition, as prewar requirements had been supplied from the Navy's own shops at the Norfolk Navy Yard. It was, therefore, necessary to convert plants already in operation and experienced in metal work for the manufacture of anchors and other similar parts, and the automobile industry proved to be the best equipped for this purpose. For charge chambers bids were invited from steel, barrel, and other manufacturers engaged in deep drawing steel and gas welding processes.

While a considerable range of prices was quoted on these mine parts, through the lack of knowledge on the part of manufacturers of their cost of production, the Navy, through actual-cost data available as a result of its own experience in manufacturing mines, assured itself of obtaining a reasonable price in all instances.

Legal matters.—During the period prior to the outbreak of the war, when the total personnel in the division numbered less than 30, legal matters were handled under the supervision of a civilian who had been in the Government service for many years and was an authority on the Navy's purchasing principles.

With the outbreak of hostilities, problems with respect to the interpretation of contracts, or the cancellation thereof, grew so numerous and weighty as to require a considerable additional force and the formation of a legal section. The pressure on this section was very great during the prosecution of the war, but it reached its climax in connection with the cancellation of contracts after the armistice. While action toward cancellation was in general taken by the sections which had originally placed the contracts, and were therefore familiar with every phase thereof, the legal section had cognizance over the legal features and general procedure relative to considerations involved in adjustments.

All outstanding contracts for strictly war material were immediately investigated after the signing of the armistice, with a view to cancellation, if practicable and desirable. The first step was the sending of a telegram, carefully worded and in the following form in all instances, in order that action might be uniform:

"Instructions are hereby given to discontinue all work under contract (Navy order) No. — as soon as practicable. No further expense is to be incurred for material obligations for Navy account under said contract (Navy order). Contractor will not maintain in any way readiness to resume operations under this contract (Navy order). Will cancellation without further adjustment be agreeable? If immediate cancellation not agreeable, request you forward immediate suggestions for adjustment to be considered in the event of future cancellation. Also advise regarding your labor situation and whether other work in plant or in prospect will entirely utilize your labor."

From the above it will be seen that cancellation was not immediately effected, but all work stopped, investigation made, and suggestions obtained from the contractor as to adjustment. If the contract could be canceled without liability or at a reasonable cost to the Navy, it was done. Material which had already been manufactured was accepted and paid for. Raw materials on hand ready for manufacture were either accepted and paid for or the contractors allowed to keep them at a fair valuation. In many cases where it was more economical to do so contractors were allowed to complete the contracts or stated portions thereof.

Approximately 1,299 contracts were canceled or partially canceled. Of this number, 835 were canceled or partially canceled without liability or cost to the Navy at a saving of \$23,830,162.23. Cancellation or partial cancellation of 194 contracts amounting to \$23,681,849.16 was affected at a cost of \$3,215,642.93 to cover raw and partly finished material taken by the Government, overhead expenses, depreciation in market price, or difference between cost and salvage value of material retained by the contractors and cost of machinery and buildings taken over or partially amortized by the Navy.

Twenty cost-plus contracts were canceled, the adjustment and cancellation value of which have not yet been determined, pending partial completion or cost investigation. At the close of the fiscal year 1919, there were also outstanding 180 contracts upon which agreement as to final settlement had not yet been reached.

Salvage and Sale Section.—The Navy realized \$4,985,618.16 from the sale of used or obsolete material from December 1, 1918, to June 30, 1919.

There were, of course, surplus stocks of some strictly war materials on hand at the cessation of hostilities. In order to realize the greatest possible advantage or effect the greatest economy, the Salvage and Sale Section was expanded to embrace all surplus, used, condemned, abandoned, and obsolete Navy-owned material.

Boards of survey, appraisal, and sale were, in accordance with the recommendation of the Paymaster General of the Navy, appointed by the Secretary of the Navy to survey and appraise surplus materials in the first, third, fourth, and fifth naval districts at Boston, New York, Philadelphia, and Norfolk, respectively, where most of the material was located, much of it having been returned from Europe.

After the material has been surveyed and appraised, it is reported through the proper channels and disposed of by transfer to stock at some yard where it can be used or by sale. These sales comprise every kind of material from machinery to food, there being quite an excess of the latter, owing to the sudden reduction in Navy personnel. Provisions to the value of \$3,800,000 were sold at cost or above to the allied Governments, relief commissions, etc. The Navy employees have received considerable benefit from the sales of food, textiles, and clothing, sales being made to them at the navy yards at cost. Other materials, however, have been sold to the general public, and in some instances at prices much above original cost. Close study of the market and selling at the most opportune time has resulted in realizing the best prices.

From a sale of blue flannel, which had been brought from various sources during the war at a total cost of \$1,976,692.20, the Navy received \$2,356,250.79, netting a profit of \$379,558.59, or 19½ per cent.

A quantity of raw wool, which the Navy had imported from Australia and for which there was no further need, was sold at several public auctions in Boston, over \$7,000,000 being realized from the sales, and every lot offered brought most favorable prices.

The laws governing sales by the Navy are much the same as those governing purchases. The widest possible competition is obtained through advertising in the public press and by the issuance of schedules to prospective bidders whose names appear on the large mailing lists maintained by each board and by the Purchase Division. While sales are generally conducted by means of sealed proposals, auction sales have been held in a few instances with a view to determining which method secured best results.

Navy orders, old and new.—Of the 6,200 Navy orders placed during the war, all have been adjusted except 380, on which investigations as to cost are now being made for the purpose of fixing final price.

While the commandeering power is still retained by the Government, it has been seldom used since the armistice.

However, it was necessary toward the close of the fiscal year 1919 to place Navy orders for fuel oil for west-coast delivery, because the prices quoted under

competition were believed to be excessive and were, in fact, much higher than the prices quoted and accepted for east-coast delivery.

The eyes of the Navy.—The Navy's need for binoculars and telescopes, spy-glasses, sextants, and chronometers could not be met by purchase, the production of these articles being far short of immediate and urgent needs at the time the enemies' submarines were most active. The only solution of this difficulty appeared to be by direct patriotic appeal to the people to loan private-owned instruments in order to provide "eyes for the Navy."

This idea originated in the Purchase Division and was followed by an appeal through the newspapers, by highly decorative posters which circulated generally, and through the efforts of the four-minute speakers. In response, 51,217 instruments were received at the Naval Observatory, of which 31,000 glasses were accepted after careful test and then issued to ships. Those unsuitable for naval use were returned to their owners by registered mail; for those accepted \$1 was paid in order that title might legally pass to the Government, this sum being considered as the rental price of the instrument, or in case of its loss as the purchase price. In every case a letter of appreciation was forwarded over the signature of the Assistant Secretary of the Navy to the donor. A serial number was engraved upon each instrument accepted and a description filed in the records of the Naval Observatory, with a record of its disposition. By this means each instrument still in existence will be traced and returned to the donor, together with a history of the use to which it has been put during the war and a recital of any incidents of interest or importance in which it played a prominent part.

Elimination of brokers.—During the period of the war the activities of brokers, commission men, and contingent-fee agents were curtailed to a minimum, due to Government regulation of industries and other causes—the Navy being especially free from their importunities, owing to the fact that firms of this nature have not been placed on the mailing list for many years past and only a small number remained thereon at the outbreak of the war.

Of these latter firms, many were debarred during the period of the war for default in delivery and other causes, including attempted fraud. Following the armistice, however, the few remaining brokers on the mailing lists immediately submitted bids in large numbers and covering all character of supplies at one opening, a considerable percentage of the bids being from these concerns.

It was obvious that the acceptance of such bids would result in an intolerable condition wherein a few firms of the above nature, owing to their being the only ones on the Navy's lists, would be in the position of having a monopoly. Furthermore, such a condition would tend to destroy the confidence and prestige which the Navy had earned among reliable and legitimate contracting concerns in all lines of industry.

The Navy, therefore, refused to accept any further bids from such agencies and eliminated all such firms from the bidding lists, thereby strictly complying with section 3722 of the Revised Statutes, which provides that:

"No person shall be received as a contractor who is not a manufacturer of, or regular dealer in, the articles which he offers to supply."

Following this action, persistent efforts were made by these brokers, agents, etc., to be restored to their former status as bidders to the Navy, but without success; and, as other Government departments have taken similar action, it is more than likely that this will become a uniform governmental attitude toward all such agencies in the near future.

As a protection against future dealings with contractors whose services have proved unsatisfactory, the Navy maintains a debarred list which at present contains the names of 231 concerns. Action toward debarment is not taken until all the circumstances relative to the contractor's failure to carry out his contractual obligations have been fully reviewed and he has been given every opportunity to present any information which might in any way be extenuating.

Navy purchasing.—While the volume of Navy purchasing has decreased materially since the signing of the armistice, it is hardly possible that it will ever reach the low prewar level, as the people of this country are proud of their Navy and will undoubtedly maintain it at a size in keeping with the important position the country has taken in the conduct of world affairs.

However, as Navy purchasing methods have passed the acid-test of actual war conditions, it will only be necessary in the future to make such constructive improvement thereupon as occasion may require and diligent application can accomplish.

FLEET DIVISION.

Although the ultimate strength of the Navy greatly exceeded the prewar logistic estimates, the plans were based on the secure foundation of practical experience and a broad conception of war-time demands, so that in general an orderly expansion only was necessary to efficiently handle the increase in the quantities of articles required. The magnitude of the work and the results obtained in furnishing the Navy with provisions and clothing adequate at all times for its needs can better be appreciated by keeping in mind the fact that it increased from a total personnel of about 60,000 men on the date war was declared to nearly 500,000 at its conclusion. To successfully supply all units of the fleet and the shore establishments with the provisions necessary for their subsistence and with uniforms and clothing adequate for their needs, at the same time avoiding an accumulation of these things in excess of prospective requirements, especially at a time when it might properly be said that the world's resources for articles of this nature had to virtually be pooled and distributed with the greatest exactitude not only to supply our own and the allied armies and to relieve distress among the vast civilian populations abroad but also that the market might not be abruptly and seriously disturbed, rendering prices prohibitive, it was necessary to prepare the Navy's estimates of prospective purchases from time to time of these necessities from an exact knowledge of its needs.

Provisions.—This was rendered comparatively easy by tables that had been prepared in advance for this purpose; one being a 30-day provisions list, showing the quantities of 65 different articles of provisions, which go to make up the Navy ration, required to subsist from 1 to 9,000 men for 30 days and by which the quantity of provisions required for any number of men for any length of time could be accurately computed in a few minutes. The other was a table showing the summer and winter clothing requirements for 1,000 men and 100,000 men; and this proved to be a useful guide for ships in laying in symmetrical stocks, and to the department in estimating the Navy's total requirements in advance.

With the assignment of destroyers and other fighting ships to European waters a few weeks after the declaration of war and the constant and rapid increase in the number of these units dispatched abroad to actively cooperate with the allied navies in the war zone and elsewhere on patrol and other duty, and due to the establishment of the large number of air stations and other naval bases abroad, it became necessary to increase our facilities for loading supply ships to keep the overseas forces supplied with provisions, clothing, and the thousands of other articles required for the work upon which they were engaged. Authority was accordingly obtained to lease a large pier from the city of Brooklyn, ideal in size and location for the Navy's use. This pier, located at the foot of Thirty-fifth Street, was large enough to accommodate about eight supply ships, of the *Culgoa* type, loading at the same time. Complete cargoes of provisions (exclusive, of course, of refrigerated meats and fresh vegetables) for loading four supply ships of this size were maintained at all times on the pier, replacements being made as soon as cargoes were loaded. As a direct result of the acquisition of this pier and the policy of maintaining on it at all times complete cargoes of provisions, supply ships were loaded with the utmost dispatch and the work of keeping our naval forces abroad at all times adequately supplied with all necessary provisions and clothing was greatly simplified.

The acquisition of cold-storage space by the Navy contributed very materially to the efficient provisioning of troop transports as well as supply ships which theretofore were forced to depend upon the willingness and often questionable ability of contractors to supply the large quantities of refrigerated products required. It was frequently necessary to place emergency orders for such products with little or no advance notice, so that the contractors were not always at fault when they failed to make deliveries on schedule. By purchasing large quantities in advance for storage in refrigerating plants under Navy control, emergency requirements for large quantities ceased to be a problem and the transports and supply ships as well as other vessels of the Navy were supplied with meats strictly up to the specifications in every respect, the serious delays incident to rejections and delayed deliveries under the contract system thus being avoided. In addition to these important military features, a considerable economy was effected by single purchases of such large quantities, although later on this was neutralized to some extent by the price-fixing policy which extended to these products.

Ships' stores stock.—Due to the short stay in port of the vessels of the transport service and on account of the restrictions placed upon the manufacture of candles and cakes by the Food Administration incident to the shortage of sugar, the fleet-supply base at New York was authorized to procure and maintain a large and complete assortment of ships' stores stock. This method proved to be particularly satisfactory and thereafter no transports or other vessels left New York without an adequate stock of these supplies, which aid so much in the comfort of the enlisted personnel.

Clothing.—The increase in the enlisted strength of the Navy was so rapid that the facilities of the naval clothing factory at Charleston and the factory at New York had to be expanded to the limit, and even then it was not practicable for the Charleston factory to keep pace with the demands for white uniforms and dungarees. In June, 1917, there were employed 604 operatives and the factory was placed on a two-shift basis of 10 hours each. At about this same time, the Secretary of the Navy authorized the erection of a temporary structure as an addition to the factory, at a cost of \$25,000.

In the meantime, however, it was necessary to place contracts in New York to augment the production of these garments. The manufacture of nainsook drawers was discontinued altogether at Charleston in order to concentrate on the manufacture of the more important articles of uniform. The contracts for the manufacture of the nainsook drawers at New York were for the labor only, the nainsook being furnished from the Navy's stocks.

The contracts for the manufacture of the white uniforms and dungarees covered only the sewing of these garments, the materials being furnished from Navy stocks and the cutting done in the clothing factory at Brooklyn, in the same manner that this work is done in the production of blue uniforms.

The operations of the New York factory are confined to cutting, baling, and distributing, the sewing of all garments being done outside by the piecework system in normal times. This system during the war, however, had to be supplemented by placing large contracts outside for the sewing of garments cut in the factory, including both blue and white uniforms as well as dungaree garments, blue caps, and white hats.

The American Can Co. building at Forty-third Street and Second Avenue, Brooklyn, with a total floor space of over 400,000 square feet, was leased and devoted exclusively to the clothing and small stores activities. On the sixth floor of this building, there is installed the largest garment-cutting plant in the country, with a capacity for cutting more than 42,000 complete garments daily. The facilities of this plant were adequate to meet all demands during the war and the contractors who put these garments together were kept supplied to the capacity of their sewing rooms.

In addition to cutting, inspecting, baling, and storing in this building, all uniforms, both blue and white, made at New York, all of the stocks of manufactured articles purchased in the open market, such as shoes, socks, jerseys, underwear, gloves, etc., were received, inspected, stored, and issued from this building.

With reference to these latter articles, especially underwear, shoes, and socks, as well as uniform materials, such as 18-ounce cloth for blue trousers, 30-ounce cloth for overcoats, etc., some difficulty was experienced in obtaining adequate supplies in time to meet the seasonable demands of the personnel of the fleet and the training stations. The situation with respect to several of these important articles became so acute that about 10 young officers of the Supply Corps were sent from Washington to the factories and mills of the contractors to personally represent to the owners, as well as the employees, the Navy's immediate need for the utmost production of which they were capable.

These officers did not confine their representations to the owners but went out into the mills and factories and addressed their pleas direct to the workers, telling them that the Navy looked to them individually to increase their production by staying on the job and keeping everlastingly at it for the sake of the men who were keeping the ocean lanes safe for our troopships and commerce. These messages carried home, and a great stimulus was felt all along the line.

To give further effect to the close contact established between the mills and factories and the Navy, a system of weekly production cards was introduced. The cards were printed to show the quantity of the various articles shipped each week, en route, etc., and were mailed weekly to the department by the contractors. From these cards charts were made up for each article, showing by

accurately plotted curves the rate of production and delivery. They constituted a most effective means for keeping the department constantly informed of the rate of production and considerably accelerated the work of meeting urgent demands.

Feeding the troops.—Upon decision that the Navy was to operate the troop transports the Paymaster General nominated a board of three senior supply officers for the particular purpose of considering all questions in connection with the subsistence of the troops en route and to prepare a standard bill of fare for use on all transports alike. This bill of fare was prepared and approved, showing exactly what was to be served to the troops for every meal for a 14-day period (the maximum time estimated to be required to make the trip across), and because of the natural interest which is attached to it this bill of fare is reproduced in this historical sketch so that it may be made a matter of permanent record:

BILL OF FARE FOR SHIPS 14 DAYS AT SEA.

First day.—Breakfast—beef stew, dumplings, fresh fruit, bread, butter, coffee; dinner—pot roast beef, macaroni, mashed potatoes, rice pudding, bread, butter, coffee; supper—cold corned beef, fried potatoes, kidney beans, gingerbread, bread, butter, tea.

Second day.—Breakfast—baked beans, cornbread, fresh fruit, bread, butter, coffee; dinner—corned beef, mashed turnips, cabbage, boiled potatoes, cottage pudding, bread, butter, coffee; supper—beef pot pie, mashed potatoes, cold beans, jam cake, bread, butter, tea.

Third day.—Breakfast—corned beef hash, fresh fruit, bread, butter, coffee; dinner—roast beef, lima beans, boiled peeled potatoes, apple pie, bread, butter, coffee; supper—fried liver and bacon, onion gravy, boiled potatoes, buns, bread, butter, tea.

Fourth day.—Breakfast—scrambled eggs, rolled oats and milk dressing, canned pineapple, bread, butter, coffee; dinner—baked beef hearts, dressing, mashed potatoes, pudding, bread, butter, coffee; supper—hamburg steak, fried potatoes, peach pie, bread, butter, tea.

Fifth day.—Breakfast—fruit canned, baked beans, corn bread, bread, butter, coffee; dinner—pot roast beef, creamed onions, boiled potatoes, rice pudding, bread, butter, coffee; supper—frankfurters, cold beans, potato salad, coffee-cake, bread, butter, tea.

Sixth day.—Breakfast—fruit, beef stew, dumplings, hominy and milk, bread, butter, coffee; dinner—boiled ham, peas, boiled peeled potatoes, apple pie, bread, butter, coffee; supper—beef a la mode, mashed potatoes, kidney beans, gingerbread, bread, butter, tea.

Seventh day.—Breakfast—pork sausage, boiled potatoes, canned fruit, bread, butter, coffee; dinner—roast beef, succotash, mashed potatoes, tapioca pudding, bread, butter, coffee; supper—cold corned beef, vegetable salad, jam cake, bread, butter, cocoa.

Eighth day.—Breakfast—baked beans, corn bread, canned fruit, bread, butter, coffee; dinner—corned beef, cabbage, boiled peeled potatoes, cottage pudding, bread, butter, coffee; supper—Hamburg steak, creamed potatoes, cold beans, gingerbread, bread, butter, tea.

Ninth day.—Breakfast—corned beef hash, stewed prunes, bread, butter, coffee; dinner—pot roast beef, macaroni, mashed potatoes, mince pie, bread, butter, coffee; supper—frankfurters, sauerkraut, potato salad, coffee cake, bread, butter, tea.

Tenth day.—Breakfast—beef stew, dumplings, hominy and milk, bread, butter, coffee; dinner—roast pork, apple sauce, corn, boiled potatoes, rice pudding, bread, butter, coffee; supper—cold corned beef, fried potatoes, kidney beans, jam cake, bread, butter, tea.

Eleventh day.—Breakfast—baked beans, corn bread, fruit, bread, butter, coffee; dinner—roast beef, lima beans, boiled peeled potatoes, pudding, bread, butter, coffee; supper—fried liver and bacon, onion gravy, boiled potatoes, gingerbread, bread, butter, cocoa.

Twelfth day.—Breakfast—scrambled eggs, rolled oats and milk, canned fruit, bread, butter, coffee; dinner—boiled ham, peas, mashed potatoes, apple pie, bread, butter, coffee; supper—beef a la mode, boiled peeled potatoes, rice pudding, bread, butter, tea.

Thirteenth day.—Breakfast—pork sausage, boiled potatoes, hominy and milk, bread, butter, coffee; dinner—pot roast beef, creamed onions, boiled potatoes,

tapioca pudding, bread, butter, coffee; supper—creamed salmon, peas, mashed potatoes, peach pie, bread, butter, coffee.

Fourteenth day.—Breakfast—baked beans, corn bread, canned fruit, bread, butter, coffee; dinner—roast pork, apple sauce, string beans, boiled peeled potatoes, pumpkin pie, bread, butter, coffee; supper—cold corned beef, fried potatoes, jam cake, bread, butter, tea.

A synopsis of the operations of the commissary department on board the *President Grant*, as reported by the supply officer of that vessel, is given, showing in detail exactly how the troops were subsisted, this report being fairly indicative of the manner in which the troops on all transports operated by the Navy were subsisted:

"The food for the troops is prepared by the Navy and served by the Army. The cafeteria system is used. The Army serving details obtain their food from the galleys and serve to the troops as the troops file by the serving tables with kits extended to receive food. The troops eat at tables, standing. The troops are messed by berthing compartments in sequence, and the mess instructions for each berthing compartment regulating the flow of troops are different. When 'mess call' is sounded, the troops must go to their berthing compartments and stand by their bunks with mess kits in readiness, waiting there until it is time for their compartment to be served. After the men have finished their meals and have washed their mess kits, they must go up on the main deck and wait their until all berthing compartments and messing compartments have been thoroughly policed. The troops' mess is the center of all ship's routine for troops and all activities are timed by the mess.

"Galleys and messing compartments.—On board this vessel there are two galleys and four messing compartments. One galley and two messing compartments are located forward, and one galley and two messing compartments are located aft. The galleys are located on the main deck directly over the messing compartments, and the messing compartments are located on deck No. 2. The messing compartments in the forward part of the ship are Nos. C-2 and D-2; those in the after part of the ship are Nos. G-2 and H-2. Food is served directly from the galleys to the serving stations.

"Serving stations.—There are nine serving stations on board for serving food to the troops and are numbered from 1 to 9, starting in the forward messing compartments and going aft. Each serving table is amply supplied with food containers and all equipment for serving food.

"Serving detail.—To be selected as far as possible from men familiar with Army mess routine for serving food to the troops. This detail will consist of 9 squads of 14 men each, with a sergeant in charge of each squad to man the 9 serving stations. Of each squad 4 men should be selected to serve prepared food from serving receptacles, 4 to keep receptacles replenished, 2 to serve coffee or tea, and 2 will procure and 2 will serve bread and butter. Printed instructions will be given each sergeant in charge of each serving station. Each squad will report at its station one hour before the regular meal is served. Each squad will be responsible for the proper cleaning of its serving station and of all serving kettles and other utensils used in serving food.

"Mess guard.—To regulate the movement of troops into and out of the messing compartments. Each one of these guards will have different instructions in printed form. The entire guard should report promptly two hours before the first meal is served and one hour before each meal thereafter.

"Serving details.—The sergeant will take orders from the steward as to the amount of each different article of food to be served per man as to the disposition of any foods, etc. He will take orders from the commissioned officer in charge with respect to the flow of the line, the time to begin, etc. In other words, the steward has jurisdiction over the food, the commissioned officer has jurisdiction over the troops. The commissary officer of the ship is, of course, in general charge.

"Sergeants will see that carriers from other stations do not take food containers belonging to his station, and that his carriers do not take containers belonging to other stations. The sergeant will be responsible for all gear, such as containers, knives, forks, spoons, ladles, etc. The serving detail will be responsible for the cleanliness of the serving station and all gear, and will clean same after each meal.

"Operating instructions.—The supply officer wishes each man aboard this ship to have all he wishes to eat. A man can not eat all he is entitled to if he eats all items. Of fruits and meats only is the ration limited, to be determined

by the steward. Of all other items each man may have all he can eat. But avoid waste. If you see men are wasting a certain item, cut it down.

"See that men move fast by serving tables, fill up each table, vacate tables at once when finished, wash kits quickly and pass up on deck without lingering. Washing facilities are limited, and only by watching this closely can best time be made. The general mess officer should pass from compartment to compartment during mess to see that the system is working smoothly."

In addition to feeding the troops, a Government mess was established for officers on all transports, the menu for which was supplemented by purchasing special articles of food not carried for issue to the general mess.

Training and assignment of supply officers.—The work of detaining commissioned officers of the supply corps and pay clerks, both Regular and Reserve, to fill vacancies in complements afloat and ashore increased as it was necessary to increase the personnel of the supply corps to carry on the work of the supply department of the Navy. An excellent idea of the increase and magnitude of the work of the supply department during the war is afforded by a comparison of the authorized prewar strength of the supply corps with the number of officers on duty at the time the armistice was signed. Before the war the total authorized strength of the supply corps was 232 officers; November 11, 1918, there were in the service on active duty a total of 3,315 commissioned officers.

In addition to this, before the war there was a total strength of approximately 205 pay clerks and chief pay clerks, which number increased to 836 up to the date the armistice was signed.

In placing additional vessels in commission, which was immediately commenced on the date war was declared, and in order to efficiently take care of the immediate increase in the volume of business of shore establishments, both at navy yards, naval training stations, and in the several naval districts, it became necessary to obtain quickly an addition to the commissioned personnel of the supply corps adequate to take care of the many duties devolving upon it in connection with the feeding and clothing of the men and obtaining the thousands of articles of ship's equipment and consumable supplies of all kinds incident to the expansion of the Navy's activities ashore and afloat.

The first drive to recruit sufficient additional officers to handle the work of the supply department was at once undertaken, and letters were written to registrars of the leading colleges and fraternities throughout the United States, notifying them for the date on which examinations were to be held for this purpose and giving some details as to the nature of the examination required. The first drive resulted in obtaining about 70 new officers, the majority of whom were college men.

This was, however, as circumstances showed, but a stepping stone to another great drive; and June 7, 1917, another examination was held in every naval district for commissioning officers in the Reserve Supply Corps. About 2,000 took this examination, and from this number a total of approximately 300 officers was added to the commissioned ranks of the supply corps. The men who took this examination and who were subsequently appointed were representative of almost every line of business activity—several bankers, many successful business men, certified public accountants, and a large number of honor men from various colleges making up the total. Of these, a great many had enlisted in the Navy at the outbreak of the war and were, in pursuance of this examination, commissioned in the supply corps from enlisted ratings.

In addition to the increase in the commissioned personnel of the supply corps by examination, 53 officers were appointed outright from distinguished military colleges, their diplomas from these colleges being evidence of their fitness, except for the usual physical examination, to be commissioned without further examination.

These successive steps show in a general way exactly how the supply corps of the Navy was recruited to take care of the great increase in the volume of the supply department's work. Of the 3,315 officers constituting the strength of the supply corps during the war, approximately 205 represent former pay clerks and chief pay clerks who were temporarily commissioned for the duration of the war and who were in consequence assigned to independent duty ashore and afloat, discharging the duties that would ordinarily fall to the lot of an officer of the rank which they held.

It was not, of course, necessary to train the officers temporarily commissioned in the duties that would devolve upon them in their independent assignments ashore and afloat, as many of them had already had many years of experience as assistants to officers of the regular Supply Corps prior to the war. But for

those other officers, who for the most part came into the Navy direct from civil life, it was necessary that they be given a course of intensive instruction in the very versatile work of the Supply Corps.

A Naval Supply Officers' School was accordingly opened at the navy yard at Washington for the instruction of the first contingent of officers who came in to the Navy after war was declared. This school was later transferred to the Washington Business High School and later on, as the size of the classes increased, the Navy was fortunate in obtaining the Catholic University at Brookland, D. C. This arrangement was effected through the courtesy and generosity of Bishop Thomas J. Shahan, whose aid in this respect was of material assistance to the department and greatly appreciated. From the Catholic University the school was transferred to the Naval Academy at Annapolis where these officers were not only intensively instructed in their professional specialty but where, through association with the midshipmen and commissioned officers of the Navy taking short courses of instruction along specialized lines, they were able to become thoroughly indoctrinated with the spirit of the Navy and to absorb—in part at least—the traditions of the service. Due to the fact, however, that it was necessary to send a large number of additional line officers for short courses of instruction at the academy, it was not practicable to continue the arrangements that had been entered into for conducting the Naval Pay Officers' School at that place, and it was then transferred in September, 1918, to Princeton University and its name changed to the Officers' Material School for the Pay Corps. Here their training was conducted along with other classes that had been established for the training of line officers.

Five experienced regular officers of the Supply Corps of the Navy, one senior officer in charge, and four juniors, as instructors, were assigned to duty at the Naval Pay Officers' School in connection with the instruction of the student officers. The course of intensive training, in addition to military instruction, covered in a general way all of the work required of a supply officer afloat, including the following subjects: Pay-roll work, commissary, canteen, and general stores.

To make the course as practical as possible it was assumed that each individual student officer had received orders for duty as supply officer of one of the smaller ships in the Navy and continued on such duty for a period of three months. A pay roll was opened, transfer accounts of officers and men received, taken up, and again transferred to other ships; and all of the paper work in connection with procuring, accounting for, and expending money, stores and material ordinarily required for the operation of such a ship during a cruise in various parts of the world was prepared in great detail.

Such monthly and quarterly returns as are required by the auditor for the Navy Department in connection with money accounts and by supply and accounts in connection with property accounts were prepared exactly as in actual practice. Lectures covering all of the subjects that were included in the course were delivered by the officer in charge and instructors.

In addition to the above, the following military work was carried on: The class was divided into a 3-company battalion, each company consisting of 42 student officers and commanded by one of the regular officer instructors. The men were put through battalion and company drills each day and one hour devoted to physical exercises, the men at all times being under strict military discipline.

Not all of the officers who came into the Supply Corps during the war, however, were sent to the school for instruction. A great many were commissioned for duties as technicians, for which their business training or peace-time profession particularly qualified them. In this way the greatly increased number of officers required to supervise the cost accounting at shipbuilding plants, mills, and factories in connection with cost-plus contracts entered into by the Navy were readily obtained. Specialists in various commodities were likewise secured in this manner for duty in connection with the large purchases of copper, steel, wool, leather, textile goods, etc. No special course of training was required for these officers—they simply transferred their services from a civilian to a military establishment where their prewar experience and training could be immediately capitalized for the Navy's benefit along specialized and technical lines.

DISBURSING DIVISION.

Its duties.—At the time the United States entered the war the duties of the Disbursing Division consisted in the payment for material delivered to the Navy under supply and account contracts, the payment of all freight and

passenger transportation services rendered by railroads and express companies, the payment of expenses of officers and civilians travelling on inspection duty and the payment of allotments made by officers and enlisted men of the Navy.

As the work expanded, additional officers were ordered to duty in the division and placed in charge of sections or of special work.

On March 1, 1918, the work and personnel of the Disbursing Division expanded to such an extent that it was decided to divide the work into allotments, retainer pay, war-risk insurance, and Liberty loans, a separate division, called the allotment division, being formed for this purpose.

Work under war conditions.—The accomplishment of the duties of the Disbursing Division before the war was mostly a matter of routine. All material for the Navy was purchased after competition, at stated prices, which included all delivery charges, and payment was made only after material was delivered. The work of auditing consisted of checking prices stated in a contract, and in most instances only one price had to be contended with. This routine condition did not remain in force after the advent of the United States into the war. The changed methods of purchasing and procuring war material to comply with the procedure adopted by the various bureaus and offices of the Council of National Defense, the War Industries Board, etc., the system of commandeering material instead of purchasing the same after competition and payment for material by advance payments, partial payments, and on the cost-plus basis required an entirely different and higher class of work.

To further complicate audit work, adjustments were necessary in many cases where the Government supplied the raw material for the manufacture of articles called for in a contract; and deductions had to be made to amortize advance payments and to collect the interest due thereon.

Purchases were usually made at a base price, with various factors to be taken into consideration in determining final prices. For instance, during the war all coal was commandeered. A price at the mines was fixed, to which were added all charges incurred by the contractor from the time the coal left the mines until it was delivered at destination. This included freight, war tax, water insurance, wharfage, demurrage, and all other handling charges.

Steel was purchased at the Pittsburgh base price, in accordance with commercial practice, with adjustments to be made to equalize freight between that point, the shipping point and destination, to which were to be added the various differentials and extras agreed upon between the Government and the American Iron and Steel Institute.

When it is known that the differentials and extras on steel and iron and the rules for applying them were contained in a book of 176 pages, it will readily be seen that to properly audit vouchers under war conditions required clerks trained, not only in accounting, but in the various trade customs governing different industries.

Reorganization to meet war conditions.—To meet these war conditions it was necessary to organize and train a force of clerks along the line of the new work. These clerks could not be obtained from the Civil Service Commission, as the eligible list was drained by the draft and by numerous calls made upon it by other departments.

In order to overcome this difficulty, yeomen (F) were enrolled in the Naval Reserve and in a short time, with the few experienced civil-service clerks as a nucleus, a well-trained and efficient force was built up and the work of payment for Navy material purchased was kept in hand at all times during the war.

The organization and training of the new force of clerks was difficult, but the question of providing working space was even more difficult.

In the beginning of the war all disbursing work was handled by 22 clerks, occupying a floor space of 2,898 square feet. At the peak of the load the work was handled by 714 clerks, occupying a floor space of 40,400 square feet.

Expansion of quarters and personnel.—So rapidly was the force expanded that shortly after the beginning of the war it was necessary to move from the original quarters occupied in the Navy Annex to the temporary structure erected at Corcoran Court. Ground for the foundation of this structure was broken December 24, 1917, and January 15, 1918, the office force moved into the new quarters, with its 54,000 square feet of office space. Moving started after office hours, Saturday, January 13, and Monday morning, the 15th, clerks were at their desks and work continued without interruption.

Disbursements.—It is needless to say that disbursements by the chief disbursing officer of the Navy in shipping and accounting increased heavily as

the war advanced. Every movement of war matériel, supplies, guns, ammunition, etc., by freight and express, and every movement of naval forces by land was paid for from this office.

During the month preceding the entry of the United States into the war disbursements amounted to \$8,853,629.85. This covered 5,089 vouchers for matériel supplied to the Navy. The number of vouchers paid and the amount of disbursements increased steadily as the war advanced, until in December, 1918, the disbursements reached a total of \$83,990,241.55, and a total of 19,488 vouchers paid. In the following month, January, 1919, the number of vouchers paid increased to 20,517, although the disbursements fell to \$71,101,649.49. The number of vouchers paid can not be taken as a criterion to ascertain the increase in the work—vouchers that before the war contained only a few items on one sheet increased to 15 and 20 sheets during the war.

The following table shows the total number of bills paid and the total disbursements by months for the last three fiscal years:

Month.	1917		1918		1919	
	Number of vouchers paid.	Total disbursements.	Number of vouchers paid.	Total disbursements.	Number of vouchers paid.	Total disbursements.
July.....	2,578	\$4,204,716.09	5,498	\$22,200,019.39	16,661	\$74,681,926.43
August.....	2,786	3,786,628.09	6,440	20,722,478.48	17,166	83,480,230.21
September.....	2,870	4,705,909.18	6,180	25,908,623.18	16,159	75,062,437.61

Grand total.....	50,634	94,375,820.74	121,931	593,251,526.45	201,133	829,004,362.26

Financing war projects.—As a stimulus to production, it was important that contractors be paid as soon after delivery of supplies as possible. This importance is emphasized by the fact that the entire output of many commercial plants was commandeered for war purposes; and, their commercial revenue being thereby cut off, such firms had to look to the Government for sufficient funds to keep their plants in operation. Every expedient was used to assist contractors for war materials in this respect. Money was advanced them for plant extensions, as provided for by the act of October 6, 1917. Contracts were so prepared as to permit partial payments, usually 90 per cent, when material was shipped, and the remainder on delivery, or to make partial payments as the work progressed. In many cases payments were made in full when material was shipped from the contractor's works.

The Navy did its part in this respect. The work of payment was kept up to date. When necessary, due to unusually heavy receipts of vouchers of one class, the forces were shifted from section to section as required; and in this way, with overtime and night work, the work was kept properly balanced.

Sixty dollar bonus.—In February, 1919, when the volume of the ordinary disbursement work began to decrease, certain legislation enacted by Congress threw an additional burden of work on supplies and accounts.

The act approved February 24, 1919, granted a bonus to all officers and enlisted men, including reservists, who served in the war and who resigned or were honorably discharged or released from active duty as reservists.

The regulations adopted for the payment of this bonus provided that persons who resigned or were discharged up to the time the act was approved were to be paid in supplies and accounts.

Within a few days after the act was passed, claims for this bonus were received by the thousands. In harmony with the general demobilization scheme then in progress not only throughout the service but among the clerical force in supplies and accounts, it was necessary to undertake this work with the ordinary office force in conjunction with the work in hand.

The first bonus payment was made March 3, 1919, and payments continued as rapidly as checks could be written by the force available. On March 18, 1919, the entire office force of the Disbursing Division and a few clerks temporarily assigned from other divisions of supplies and accounts were placed on this work. Records were posted each day showing the number of claims audited, checks written, checks mailed, and other papers disposed of. In this way, competition was established among the clerks and the work of paying the bonus expedited.

This "drive" was continued until March 29, 1919. On this date, all payable claims in the office had been paid and the work of bonus claims was up to date. The clerks were reassigned to their regular work, which was then far in arrears, and a small section was established to care for incoming claims.

The following table shows the number of claims paid each day during this drive:

Date.	Number of checks written.	Date.	Number of checks written.
Mar. 18.....	2,334	Mar. 24.....	6,450
Mar. 19.....	10,000	Mar. 25.....	3,630
Mar. 20.....	12,000	Mar. 26.....	3,605
Mar. 21.....	15,562	Mar. 27.....	1,380
Mar. 22.....	17,500	Mar. 28.....	12,365
Mar. 23.....	(¹)	Mar. 29.....	4,035

¹ Sunday.

On June 30, 1919, 181,200 of these claims had been paid.

Additional travel allowances.—The act approved February 28, 1919, granted an allowance of 5 cents per mile from place of enlistment to place of discharge or to the homes of men discharged or released from active duty and further increased the work in supplies and accounts.

Payment of this allowance to men discharged or released prior to March 13, 1919, was undertaken in supplies and accounts. Men discharged after that date were to receive the allowance in the settlement of their account.

This work is being carried on by the regular office force, and, from the beginning date these claims have been paid as rapidly as they have been certified by the Bureau of Navigation, to which bureau all such claims are submitted.

On June 30, 1919, 2,129 of these claims had been paid.

The foregoing treats only of disbursements on account of material delivered to or services rendered the Navy. Other branches of work handled by the chief disbursing officer are the payment of allotments, other than War Risk allotments, and of retainer pay to reservists, also the receipt and maintenance of allotment and insurance applications under the war-risk insurance act.

Allotments.—In the allotment section is the system whereby all in the Navy are enabled to provide unfailingly regular financial support for their families and dependents. Under this system any member of the naval forces may allot any portion of his monthly pay to any designated beneficiary or depository; and, although the checkage of the sum allotted against the grantor's account follows him to any part of the world, payment of the same is made punctually on the last day of each month by a check mailed from the disbursing office in Washington.

April, 1917, found in operation a well-tried and efficient system for handling allotments. It consisted of a card system of bookkeeping, a card for each allotment, filed alphabetically, and a corresponding file of stencils from which the checks and abstract of payment for the auditor were printed. The printing of checks and auditor's abstract and the posting of payments on the allotment cards were effected by machines especially designed for the system, thus making for accuracy and dispatch. This system was continued in operation throughout the war, changed in no essential but merely developed, perfected in detail and expanded immensely to accommodate the enormous increase in the number of allotments to be handled.

When war was declared, voluntary allotments formed a section of the Navy Disbursing Office with a bare dozen clerks, a few feet of card files, a half-filled stencil file, two stencil printing machines, a stencil cutter, and 10 desks constituting the section. The total number of allotments paid in March, 1917, was

17,815, amounting in all to \$573,582.95, which made a striking contrast to the figures for a year later, those for June, 1918, being 128,002 allotments paid, aggregating \$2,689,496.18.

Like a sensitive barometer, the number of allotments on file and the magnitude of the total monthly disbursement marked the pressure of enlistments in the Navy and enrollments in the Naval Reserve Force. The figures from March, 1917, to December, 1917, are given below:

Month.	Number of allotments.	Total disbursed.
March.....	17,815	\$573,582.95
April.....	18,343	599,934.51
May.....	19,806	677,049.77
June.....	21,884	751,490.53
July.....	29,193	860,614.11
August.....	33,727	955,899.32
September.....	37,072	1,077,662.91
October.....	40,416	1,167,222.50
November.....	51,581	1,296,968.66
December.....	85,546	1,740,932.64

By December, 1917, allotments had so increased in number and new ones were being registered in such volume that it was necessary to detail an officer whose sole duty would be attention to this section. Then the period of greatest expansion and development began. The figures from January, 1918, to June, 1918, are given below:

Month.	Number of allotments.	Total disbursed.
January.....	77,316	\$1,664,969.53
February.....	97,829	1,916,998.35
March.....	88,974	2,148,287.21
April.....	84,177	1,904,580.23
May.....	95,936	1,899,430.06
June.....	128,002	2,689,496.12

The following table shows the number and amounts of allotments carried and paid during the three fiscal years covered by the war and serves as a convenient illustration of the increase in the work brought about by the war:

Month.	1917		1918		1919	
	Number of ac- counts.	Total dis- bursements.	Number of ac- counts.	Total dis- bursements.	Number of ac- counts.	Total dis- bursements.
July.....	17,156	\$519,391.14	29,193	\$860,614.11	127,078	\$2,353,892.71
August.....	17,202	520,658.34	33,727	955,899.32	109,676	2,271,135.43
September.....	17,002	516,642.90	37,072	1,077,662.91	101,014	2,438,966.26
October.....	16,639	503,401.64	40,416	1,167,222.50	134,258	2,084,278.18
November.....	16,273	493,476.88	51,581	1,296,968.66	226,371	3,127,488.69
December.....	15,990	488,107.70	85,546	1,740,932.64	271,467	4,145,193.12
January.....	16,498	513,041.42	77,361	1,614,969.53	280,214	1,981,549.14
February.....	17,106	534,277.43	97,829	1,916,998.35	160,956	2,941,709.55
March.....	18,015	573,582.95	88,974	2,148,287.21	161,167	3,762,769.76
April.....	18,378	599,934.51	84,177	1,904,580.23	158,544	1,746,622.90
May.....	19,932	677,049.77	95,936	1,899,430.08		
June.....	21,915	751,490.53	128,002	2,689,496.18		
Grand total.....		6,691,055.21		19,303,051.72		26,853,606.74

Reservists' retainer pay.—The disbursing and retainer pay to members of the Naval Reserve Force was, like voluntary allotments, one of the functions of the Disbursing Division which grew to such proportion after the declaration of war that it became a separate section.

April, 1917, found a bare 5,000 retainer-pay accounts on file in a small corner of the allotment section of the Disbursing Division and scarcely half a dozen

clerks engaged in disbursing this pay. By the time the armistice was signed there were some 300,000 accounts on file, and the retainer-pay section had become an office of 40 clerks, under an officer, in addition to those clerks shared with the voluntary allotment section in the latter's stencil and machine room.

The following table shows the increase in this branch of the work during the war:

Months.	1917		1918		1919	
	Number of accounts.	Disbursements.	Number of accounts.	Disbursements.	Number of accounts.	Disbursements.
July.....	470	\$2,235.79	35,792	\$97,209.00	217,251	\$386,241.05
August.....	510		44,925	30,677.37	247,791	237,774.90
September.....	510		47,951	25,147.73	259,842	67,897.18
October.....	510	1,791.00	51,736	154,446.48	270,686	104,339.20
November.....	560	1.05	55,498	25,916.44	278,172	197,007.84
December.....	600		63,696	19,391.49	277,287	153,785.09
January.....	656	18,361.78	63,696	20,207.44	275,721	293,294.12
February.....	1,489	507.24	63,770	85,822.53	274,476	83,504.48
March.....	5,498	227.18	88,054	33,423.49	274,221	69,871.90
April.....	16,022	75,092.45	105,655	113,996.18	272,772	319,374.24
May.....	28,342	20,877.65	138,889	59,125.59		
June.....	33,994	18,402.48	175,755	47,072.27		
Grand total.....		137,496.63		712,436.01		1,973,090.00

War-risk insurance.—The passage of the war-risk insurance act, October 6, 1917, was more momentous than was at first realized. It established a bureau in the Treasury Department which finally employed 20,000 people. The purpose for which this bureau was established was to provide men in the service with the means for making allotments to their dependents with an additional allowance by the Government, an opportunity for subscribing for life insurance at net rates, and protection in the form of compensation to disabled men and to the dependents of men dying in the performance of duty.

There developed upon the Navy the necessity of registering the insurance and allotment forms—a work which loomed large with the expansion of the sea defense to over half a million men. Until the final draft for the Army was provided, no one knew what a volume of work was to pass through the Bureau of War Risk Insurance. The increase of the two arms of the service not only gave the Navy a great accounting task of its own, but the problem of interpreting its military necessities, regulations, and ratings to a bureau the bulk of whose work was occasioned by the large drafts of men entering the Army. This situation was met by establishing a war-risk section in Supplies and Accounts. All applications were forwarded in duplicate to this section, the original being forwarded to the Bureau of War Risk Insurance and the duplicate retained in the Navy files.

The first insurance applications were received about October 17, 1917, and after being examined and found correct were forwarded to the Bureau of War Risk Insurance.

During November, 12 pay officers who had had experience in insurance were ordered to the war-risk section and instructed in various features of the war-risk insurance act. Later they were ordered to the various naval districts in this country and to foreign stations, one being sent to Hawaii, Guam, China, and the Philippines, and four of them going to Europe.

The records show that more than 80 per cent of the \$2,000,000,000 insurance written in the Navy to and including June, 1918, was the result of the personal efforts of these 12 men.

The first applications for family allowance were forwarded to the Bureau of War Risk Insurance December 19, 11,000 being forwarded during December. Up to and including January 8, 41,000 applications for family allowance, part containing allotments and part showing no dependents, were forwarded to the Bureau of War Risk Insurance, and January 12 the first checks for Navy family allotments and allowances were mailed by the Treasury Department. Something less than 10,000 checks were mailed in January for payments due in December. By the end of February the Bureau of War Risk Insurance had mailed to the dependents of Navy men 20,300 checks, totaling \$1,492,770.

During the latter part of January, 1919, it was decided that as the work of the Bureau of War Risk Insurance was being handled promptly, the continuance of a war-risk section in the Navy was no longer necessary. At a conference between representatives of the Navy and the Treasury it was agreed that the Navy could turn over the work of the war-risk section to the Bureau of War Risk Insurance February 15, provided clerks in the war-risk section were released to accept positions in the Bureau of War Risk Insurance. On February 1 the Navy files were closed and February 15 the section disbanded, leaving only 50 clerks and 2 officers to complete the work on the files.

On April 1 the last unit of the war-risk section was disbanded and the Navy files were turned over to the Bureau of War Risk Insurance.

The efficient manner in which the Navy handled war-risk insurance matters was commented upon by both the Army and the Treasury Department; and the fine work of the insurance officers is brought out by the fact that 500,000 men in the Navy subscribed to four and a quarter billions of Government insurance during the war.

Liberty bonds.—When the problem of affording officers and enlisted men of the Navy serving at outlying stations and at sea an opportunity to subscribe for Liberty bonds the same terms of partial payments afforded by banks to subscribers throughout the country arose, it was found that the disbursing organization in Supplies and Accounts was ready with the solution.

Liberty bonds were sold to the officers and men through their supply officers and payments made through the allotment system in Supplies and Accounts. Had it not been for this expedient, thousands of persons in the Navy would have been cut off from participation in the various Liberty loans.

Not only were the payments for bonds arranged, but an extensive educational campaign was carried on throughout the service to bring to the attention of all concerned the advantages of the Liberty loans and the methods by which bonds could be purchased.

ACCOUNTING DIVISION.

Accounting, cost determinations, and finance.—A wide variety of matters occupied the attention of the accounting organization of the Navy during the war. The accounting responsibility of the Supply Corps prior to the war resulted in there being available at the outbreak of the war a considerable number of officers of such experience that the building up of an organization adequate to cope with the new conditions was satisfactorily accomplished.

Necessity for cost-plus contracting and cost determination.—A large part of the accounting effort of the war period was required in connection with the purchasing of materials in cases where the determination by the Navy itself of cost and proper compensation was necessary, i. e., in all cases where, for one reason or another, a fixed-price contract was not feasible or could not be entered into without investigation, and where the product contracted for did not fall under general price agreements controlled by the War Industries Board.

The situation as regards wages, cost of materials, and financing of additional plant capacity was, of course, such as to make it necessary for many manufacturers to ask for cost-plus contracts; on the other hand, the Navy, in order to avoid the necessity of allowing manufacturers a wide margin for contingencies, found in many cases that its interests required a cost-plus contract with a continuous and careful inspection of costs thereunder.

In other cases examination of bids and estimates were made. In order that a fair fixed-price contract could be entered into. Where the execution of a contract was impracticable, Navy commandeering orders for manufacture were issued, and an examination of the costs thereunder was made in order to determine a fair fixed price.

Scope of special cost and financial examinations.—Several hundred accounting examinations were conducted to determine the fairness of bid prices on proprietary articles, the proper allowances for amortization of plant improvements, the financial condition of various companies and the merit of their claims for advances of money under the act of October 6, 1917, as well as proper methods of securing these advances and providing for their liquidation to determine proper adjustments due to increased wages and material costs, to make proper settlements in cases where the exigencies of war required the undertaking of the work under oral or general understandings, to arrange proper methods of making progress payments and other means of assisting contractors to carry out their obligations, to make the necessary adjustments in cases where Government copper, spelter, and other materials were furnished on consignment for fabrica-

tion or assembly, to arrive at a fair basis of settlement in cases of commandeering of plants, and to adjust contracts which for one reason or another were canceled. Examinations of this kind involved a total money value of about \$55,000,000.

Other special accounting problems.—Other financial matters of unusual complexity which arose included adjustments with the Shipping Board, the War Department, the Allies, and private parties on account of charter rates, freight rates, and inventories on cargo vessels and troop transports seized, purchased, or built; adjustments of accounts receivable and payable with the British and French missions and other departments of the Government; foreign exchange matters arising in South America, China, Turkey, and Europe; the shipment of money; the organization of accounting systems for the new navy plants, development of accounting systems for the naval districts and the Naval Overseas Transportation Service, and the meeting of the many new problems arising in navy-yard accounting with respect to cost keeping and the interpretation of legislation and decisions affecting yard labor. With the signing of the armistice, the slackening in these activities was offset by problems of settlement, questions of appropriation accounting, which, with the curtailment of funds, immediately assumed importance; problems of cost accounting due to the necessity for the furnishing of statistical information, and problems of stores accounting due to the necessity for cleaning up the large stocks of material on hand.

Accounting organization and savings effected.—To meet the war conditions a force was organized which, June 30, 1918, included 15 officers and 255 junior accountants and clerks in Supplies and Accounts and 130 officers and about 2,000 junior accountants and clerks in the field, located throughout the country at about 100 major plants and shipbuilding yards and several scores of small ship-repair yards and machine shops.

The activities of this organization resulted in actual concrete savings to the Navy of \$19,000,000 on special cost examinations alone and of a considerably large amount on cost-plus contracts, without attempting to estimate what further amounts might have been charged to the Navy had the control exercised by this organization been absent.

Cardinal principle of cost inspection.—This control was exercised, on the whole, with little friction. The accounting organization was imbued with the idea that a way must always be found to prevent waste of the Government's money without interfering with the expeditious prosecution of the work.

The sphere in which the application of this cardinal principle was most necessary was in the administration of the cost-plus contracts. Supplies and Accounts was concerned with the inspection of costs under three general forms of these contracts which, due to the organization of the Navy Department, were administered in three separate ways:

1. The manufacturing contracts, including guns, aeroplanes, forgings, special devices, and supplies, aggregating \$124,000,000;
2. Shipbuilding contracts; and
3. The ship-repair contracts, under which were expended \$315,000,000 and \$60,000,000, respectively.

Payments under public works cost-plus contracts were made by the disbursing officers upon the certificates of the engineers of the Bureau of Yards and Docks.

All the manufacturing cost-plus contracts were written and entered into by Supplies and Accounts, and the cost inspection under them was carried on by Supplies and Accounts and its local representative, the cost inspector, working where necessary in conjunction with the bureau concerned and its inspector, particularly as to their approval of the necessity for material and the proper ratings of mechanics, and also where the bureau concerned desired to express an opinion with respect to the propriety of charges.

General results under cost plus.—As to the manufacturing contracts, therefore, of which there were 143 in force at 77 plants, it is possible to speak with knowledge of all phases of the problem which have arisen, from the preliminary negotiations with the contractors to the final settlement. Notwithstanding the obvious objections to cost plus, the operations under these contracts were on the whole satisfactory.

The general weakness of the cost-plus contract from the standpoint of the Government is, of course, the tendency toward lack of interest or effectiveness on the part of the manufacturer in keeping costs down. As a partial offset to this, profit under the contract was, wherever practicable, made a lump sum instead of a percentage of cost.

General methods of control under cost plus.—The standard Supplies and Accounts manufacturing cost-plus contract established a community of interest between the Government and the contractor in that where practicable the profit is not a percentage on cost, increasing as the cost increases, but is a fixed sum per unit of product. Under such conditions it is to the contractor's advantage to prosecute the work expeditiously in order sooner to realize his profits, this being to the advantage of the Government in the matter of deliveries and also in the lower costs that are likely to accompany rapid turnover. In the latter contracts the contractor was allowed a percentage, varying from 25 to 50 per cent. of the saving effected by reducing the actual cost below the cost estimated at the time of execution of the contract.

Other and more universal methods of control over waste were exercised. The first was the careful drawing of the contract to exclude expenses not properly chargeable to Government product. The chief of these is a considerable group of charges, such as advertising, bad debts, discounts, commissions, etc., in general to be described as selling expenses, which in fact—as the Government takes up more and more of the capacity of the plant—gradually tend to disappear. A further group of charges embraces those which some manufacturers customary include in overhead, but which are in reality a proper charge to profit and loss or surplus account, such as interest, income and profits taxes, losses on contracts, excessive salaries, etc.

Further than this, a careful system of control over methods of purchase and prices of material and plant procured by the contractor was established; tool rates and depreciation accounts were examined and wage schedules compared with the rates prevailing in the vicinity. All wage schedules were submitted to the Secretary of the Navy for approval in conformity with the general labor policies of the Government, as expressed by decisions of the Shipbuilding Labor Adjustment Board, the National War Labor Policies Board, and similar boards operating in connection with strictly Government agencies.

Though the high cost of labor was sometimes attributed to the wide vogue of the cost-plus contract, it is believed that on the whole it can not fairly be so attributed, being due rather to general conditions and policies in which the form of the contract under which labor is employed is but a minor factor. Apart from the wage element in the high cost of labor, there is, of course, to be considered the question as to whether the day's pay represents a full day's work. The most careful attention was given to this feature of cost inspection, and each Navy cost inspector had a force of competent men to cover this matter day and night.

Main facts established under manufacturing cost plus.—The most careful supervision was exercised over all expenditures. The main points which this supervision was designed to establish were:

In the case of labor.—Actual outlay on the part of the contractor, as evidenced by pay rolls, etc.

Actual application to Navy work, as evidenced by Navy time checking.

Reasonableness of wage schedules or conformity to awards made by Governmental wage-adjustment agencies.

Propriety of the workman's classification as a first or second class mechanic, etc., as the case might be, established by the production inspector.

In the case of material and of plant purchases.—Actual outlay and all discounts applied, as evidenced by receipted bills or other satisfactory evidence of payment.

Necessity, methods of purchase, and reasonableness of prices covered by approved material or plant orders.

Certification by material inspectors at plant or point of shipment.

In the case of factory overhead and general and administrative expense.—Actual outlay, as evidenced by the contractor's vouchers supporting the expense accounts, etc.

Exclusion of items not allowed by the contract as a charge to the Navy. If

NAVAL INVESTIGATION.

2385

were verified, time clock and piecework records examined, and various other checks made.

Control of manufacturing material costs.—A thorough system of control over subcontracts were established. All orders, prices, and awards for materials and plant equipment purchased specifically for the Navy contract were approved in advance by the production and cost inspectors located at the plant; and in the event that the amount of the order exceeded \$1,000, the approval must have been concurred in by the chief of the bureau concerned and the Paymaster General. If, however, prompt action was necessary in connection with the placing of the purchase order, the local inspectors were given authority to approve orders not in excess of \$3,000. In the case of aircraft contracts, the approval of all orders was delegated to the local inspectors, for the reason that in nearly all such cases prompt action was necessary, and due to the fact that a large portion of the material entering into the production of aeroplanes was supplied through Government departments, in which case approval of prices was not necessary. All such orders, however, were later reviewed by S. and A. as to reasonableness of prices secured.

Control of manufacturing overhead costs.—In the standard manufacturing contract interest and rent were not allowed as items of overhead expense. The standard contract analyzes rental charges paid into:

- (a) Interest and profit on investment; and
- (b) Insurance, depreciation, maintenance, etc.

That portion of the rental paid which represents items under (b) was allowed as a part of overhead. This provision was adopted in order to place on the same footing with regard to overhead determination the contractors who own their plants and those who obtain the use of a plant through rental or borrowing. If both contractors are allowed the scale of profit paid to a manufacturer who has sufficient working capital, and who not only operates but owns his plant, that element of profit which is a return on investment belongs to the owner of the property or capital, and the contractor who rents or borrows must meet his interest charges out of his profits.

Advertising, selling, and collection expenses, credit losses, and customers' discounts not being connected with the cost of production under Navy contracts, were not allowed. The distribution of charges of this nature to commercial product constituted in no sense a discrimination in favor of Government purchases, but merely placed the additional cost incurred in connection with commercial sales where it belonged.

Inasmuch as administrative expense is incurred in connection with the supervision of the selling organization in solving problems of production and in looking after the finances of the business, such expenses are therefore partly a production cost and partly a selling expense. Only that portion of the administrative expenses applicable to production was allowed as a charge to be prorated over the productive activities of the contractor, the Navy contract bearing its prorata share thereof.

In order to assure that the salaries of executives charged to the Navy contract were not excessive, comparative salaries for the past three years were obtained and only normal increases allowed.

Bonuses paid to executive officers in the form of a percentage of the profits or in the form of a stock payment were not allowed, inasmuch as in the cases reviewed it appeared that this was a sharing of the profits of the business with certain executives rather than payments made in lieu of nominal salaries. Bonuses paid to foremen or subforemen or other employees, the primary object of which was to speed up production, were allowed as a proper charge, as the benefits derived therefrom were shared in by the Navy contract.

Extraordinary repairs to buildings and other items properly chargeable to the capital investment of the contractor were excluded from the ordinary maintenance and upkeep of the plant, to be prorated to the Navy cost-plus contract.

Special reports were required relative to depreciation rates, containing com-

contractors generally entered claim for the profits which it was anticipated would have been realized had the contract been carried to completion. While it was the Navy's desire to deal fairly with the manufacturers and to impose no undue hardships upon them as the result of cancellation or reduction of contracts, it was felt that the contractors were not entitled on a partially completed contract of the profits which would have accrued from a fully completed contract. A general practice was therefore followed whereby a profit was paid on goods in process, based upon the profit allowance stated in the original contract, together with such expenses as were incurred in connection with the reduction of the contract.

Cost examination on Navy orders and fixed-price cancellations, etc.—Apart from the cost-plus contracts, the principal war-accounting activities were in connection with the determination of prices on Navy commandeering orders and special investigations of fixed-price contracts, a large number of the latter being in connection with cancellations after the armistice. Nearly 1,000 special cost examinations were made.

Most of the accounting examinations on Navy orders were made under clause B, Navy orders, for the purpose of determining final price on products to be manufactured on the basis of price-to-be-determined, which usually was interpreted as cost plus a reasonable profit. These examinations involved a determination of the cost of a particular product plus a determination of what would be a reasonable profit for this product; the latter factor involving consideration of the average investment required to complete the order.

A second class of examinations comprised those for the compensation board, involving a complete analysis of the business of the company. These examinations were made for the purpose of ascertaining the reasonableness of the price policy of the company. Based on the prices recommended in these examinations, the compensation board approved purchases made by Navy cost-plus shipbuilding contractors. These recommendations ran into several millions of dollars.

Miscellaneous examinations included those under fixed-price contracts to determine the amount of adjustment to be made on account of change in specifications or extra orders by the Navy Department; cancellation settlements on contracts and subcontracts; those made to determine overhead rates and bogey prices for proposed cost-plus contracts, to determine whether the Navy should advance funds to the contractor and the method by which such loans should be repaid and other miscellaneous matters.

General method of cost determinations.—Price determinations were made by one of three distinct methods:

(a) At the completion of the production of the article when actual costs could be ascertained.

(b) In advance of production of the article, in which case the examinations were based upon inspection of previous costs or corrected previous costs or detailed estimates prepared by the company, consideration always being given to the fact that previous costs were not necessarily applicable to the present order; and

(c) By inspection during the period of production, in which case a cost inspector made test checks during the course of manufacture.

In some cases it was found necessary to maintain continuous cost inspection in order to obtain satisfactory costs.

In all examinations, inspection of the company's records has been insisted upon. On orders over \$100,000 and the more important of the smaller orders, a representative of shipping and accounting was detailed to the company's plant. On the smaller orders, final reports were based on data furnished by accounting officers stationed throughout the country.

On account of the large increase in the number of Navy orders requiring determination of costs and profits and the limited personnel available, a method was inaugurated of requesting the contractor to indicate within 30 days after receipt of Navy order whether he would apply for final price—

(a) On the basis of prior cost records, corrected prior cost records or detailed estimates; or

(b) At the conclusion of the order on the basis of actual cost.

In each case, the contractor was requested to forward cost summaries supported by affidavit. The Navy reserved the right to substantiate the correctness of the summaries submitted by an examination at any time of the contractor's records and also reserved the right to install cost inspection at the plant where such procedure was required to safeguard its interests.

Profit and return on investment.—Determination had to be made of a reasonable allowance to cover compensation for doing the work and return for the use of the contractor's own investment and interest on borrowed capital. The two factors of profit and interest are so closely interlocked that joint treatment rather than segregation produced the most satisfactory result. No single method could be arrived at of determining reasonable allowance for profit and interest which would be uniformly applicable to all cases and satisfactory to all parties concerned. Through a large number of examinations of company records, it was clearly demonstrated that a uniform fixed percentage on cost does not yield a fair return on the stockholders' average equity so far as individual companies are concerned; consequently, each business must be dealt with on its own merits.

Considerable attention was given to the relation of the profit allowance on a particular product to that portion of the stockholders' average equity used in producing the commodity or performing the services being costed; and return on investment, rather than the percentage on cost, was the principal guide in determining reasonable allowance for profit and interest. The allowances made were also expressed as a percentage on cost for convenience. The method applicable to the largest number of concerns and most satisfactory to the contractor was to determine a reasonable profit on that part of the stockholders' average investment used to produce the article to be delivered. Properly applied, this method involved a complete examination of the contractor's business to determine the character of the assets comprising the stockholders' investment and the manner in which these assets were used in producing the variety of products manufactured.

An established method of ascertaining profit allowance does not appear to be in use among business houses. Many use an arbitrary percentage added to factory cost to cover not only profit and interest but also general expenses, amortization, sinking funds, etc.; some use 10 per cent on cost because of the prominence given this percentage in connection with cost-plus contracts. Most companies appear to establish a selling price by what "the traffic will bear."

For the average concern it was found that the percentage on cost required to allow a return on the stockholders' average equity ranging from 10 per cent to 20 per cent per annum would vary from 2.5 per cent to 15 per cent. In several cases the percentage on cost exceeded 15 per cent; in several instances, profit allowance exceeded 20 per cent on investment, as hereinafter referred to. Comparison of relation of percentages on cost to percentage on investment, taken from various examinations, will be of interest.

Commodity.	Percentage on cost, allowing a return on investment of—	Percentage per annum on investment.
Carburetors.....	4	27.5
Wire and cable.....	6	18.9
Iron chain.....	7	19.6
Searchlights.....	9	20.7
Sul ammoniac.....	10	16.2
Strainers.....	15	12.6

A fair allowance is dependent on the several factors enumerated below, the importance of each varying with the circumstances in a particular case: (a) Percentage return on amount of investment involved; (b) extent to which work is sublet; (c) amount of interest charges to be paid out of the combined allowance for profit and interest; (d) whether the product involved is part of or an adaptation of the company's regular business, whether it was specially designed by the company or produced from Navy design; (e) whether it has been necessary to convert the plant to handle war business; (f) amount of special plant facilities which have or have not been amortized against Government orders; (g) likelihood of additional orders; (h) period for which the price is established; (i) reliability of cost data available; (j) industrial hazards; (k) miscellaneous factors.

The use of return on investment as the principal guide to reasonable profit involves careful attention to the measurement of the two factors entering into

dennite allocation of assets and liabilities as between the various commodities produced; or (b) by averaging the equities at the beginning and end of the period involved, making allowance for dividend disbursements during that period.

The method used in a particular case depends on the character of the particular business involved, the manner in which the accounts have been kept, and the character of the product being costed.

Occasionally both investment and profits could be subdivided between Government business and commercial business, in which case the information was far more reliable. The definite measurement of the amount of investment applicable to a particular order was found difficult to determine; and in the case of integrated companies producing diverse products, such as steel, brass, etc., impossible of measurement within the time available.

The stockholders' investment was approximated as follows:

Cash, receivable and inventories-----	\$-----
Less accounts and notes payable and accrued liabilities-----	-----
Balance, working capital-----	-----
Add land, buildings, equipment (less mortgages)-----	-----
Total, stockholders' equity-----	=====
Represented by:	
Capital stock-----	-----
Surplus, per books-----	-----
Surplus reserves-----	-----
Stockholders' credit balances-----	-----
Total-----	-----
Less:	
Intangible assets (good will, patents) not represented by cash expenditures-----	-----
Investment in properties or securities not applicable to product being costed-----	-----
Stockholders' debit balances-----	-----
Total deductions-----	-----
Balance, stockholders' equity (as above)-----	-----

Capital stock represents the net amount outstanding. From the total stock issued was deducted all treasury stock, unissued stock, and unpaid subscriptions. Premium on capital stock was added.

Surplus per books as shown in the accounts.

Surplus reserves consist of any segregation of surplus which may be made in an individual case for reserve for contingencies; reserve for inventories to cover possible drop in market value after the war; excessive reserves for bad debts, etc. Included also is the reserve for Federal taxes where the assets represented by such reserve are used productively until actual disbursement is made; and from an operating viewpoint it is immaterial whether or not a formal segregation of surplus is made by the company. If the reserve is represented by cash funds or marketable securities, the assets also were eliminated.

Stockholders' credit balance may be represented by dividends credited but not withdrawn; by loans or advances made by stockholders or partners (in the case of partnerships) or other items which in fact represent investment used productively and which are not charged to cost.

Elimination of good will and patents not represented by cash expenditures intended to eliminate "water." If the profit allowance is to be based on the stockholders' average investment, it is essential to eliminate any "water" which may exist, whether it be buried in a "plant, good will, patent," etc., account or whether the intangible items appear separately. It was necessary in

the profits or expenses connected therewith considered in the profit allowance. Stockholders' debit balances were represented by unpaid capital stock balances, loans to stockholders, etc., and were excluded as being in fact a reduction of the stockholders' investment used productively.

Some companies handle variegated products, part of which have a quick turnover and part a relatively slow turnover. In such cases care was taken to see whether the average turnover of the business as a whole was applicable to the particular product being costed and, if not, to what extent arbitrary adjustment should be made. The importance of ascertaining turnover is evident. If the cost of goods sold is equal to the stockholders' equity, there is a turnover of "one;" and, consequently, 15 per cent on cost will allow a return of 15 per cent on investment. If the cost of goods sold is twice the average stockholders' equity, the turnover is two times; and, consequently, only $7\frac{1}{2}$ per cent on cost is necessary to allow the same rate of 15 per cent return on investment. Conversely, if the cost of goods sold be one-half of the average stockholders' equity, the turnover is one-half; and, consequently, 30 per cent on cost must be allowed to give the same 15 per cent return on investment, all of which may be stated as follows:

Case.	Average investment.	Cost of sales.	Turn-over.	15 per cent on investment.	Per cent on cost required to give 15 per cent on investment.
1.....	\$100,000	\$100,000	1.0	\$15,000	15.0
2.....	100,000	200,000	2.0	15,000	7.5
3.....	100,000	50,000	.5	15,000	30.0

These variations are due primarily to the character of the product rather than to management.

It is immaterial whether the profit allowance is divided interdepartmentally or intercompany, provided the total profit included in the final price is reasonable.

Where profit allowance is an arbitrary percentage on cost no interdepartment profit was allowed. A producer of forgings requested that reasonable price be ascertained by adding cost of ingot plus 15 per cent profit thereon plus cost of forging plus 15 per cent profit on accumulated total. It was stated that if the forging manufacturer purchased the ingot the first profit would be obtained by the ingot producer, and the forging manufacturer would obtain a profit on a forging cost which included ingot cost plus the first profit. Claim was disallowed on the ground that the profit allowance of 15 per cent on cost was intended to cover both processes, and if either one only had been undertaken the rate would have been reduced.

Where the profit allowance is based on a return on investment, it is immaterial whether the profits be built up by operations or determined for the job as a whole, inasmuch as the total profit will be the same in either case.

Definition of costs.—The definition under which costs are determined under a Navy order is the same as that appearing in the standard manufacturing cost-plus contract already referred to, except, for special reasons, in the matter of rent. The determination of proper costs upon which final prices are based does not in any sense involve a discrimination between the terms under which the Government and the public shall purchase. It involves merely a determination of the proper distribution of costs to the various contracts in the contractor's plant, certain improper elements of cost being disallowed and certain other expenditures being taken care of out of profits where they should be.

Overhead in cost determinations.—The overhead expenses as shown by the books of account were set out so as to segregate allowable items from those specifically disallowed, and where practicable were subdivided as between fac-

tory and general and supported with schedules showing detailed classification. The basis upon which overhead expenses are apportioned to the Navy order are indicated in detail and showed length of time such basis of apportionment had been in use. Only that portion of the overhead expense which is equitably assignable to the period of production was allowed.

Selling expense in cost determination.—It appeared that all selling commissions are in fact no-contract-no-fee arrangements, and as such should not be charged against Navy business. In *Crocker v. United States* it is stated:

"The Supreme Court has denounced the procurement of Government contracts by agents employed on a contingent-fee basis, declaring that there is no difference in principle between agreements to procure favors from legislative bodies and agreements to procure them in the shape of contracts from executive officials; that the no-contract-no-fee arrangement suggests an attempt to use sinister and corrupt means."

Any contractor can have his name placed on the bidders' list, to be notified of the prospective purchases upon which he may desire to bid. In view thereof it is unnecessary to pay commissions to agents to obtain Navy business, and if such commission is paid it is not as a matter of department policy considered as a legitimate item chargeable against cost of product sold to the Navy.

This exclusion is particularly applicable to an arrangement whereby a Washington representative was paid a commission on all sales to the Navy, whether the order is placed through him or directly with the home office or in some cases with other offices of the company.

Where the sales agent was also the owner of the concern producing the product, the arrangement between the sales and producing concerns was ignored and the two concerns treated as a single organization, similar to the method adopted in cases where the contractor sublets the entire contract.

Excessive salaries and bonuses in cost determinations.—Excessive salaries were view as a distribution of profits and hence excluded from costs. The line of demarcation between fair and excessive salary is admittedly indistinct, so each case was dealt with on its merits and full consideration was given to the actual services rendered by the individuals concerned. This was of special importance where the party drawing an excessive salary was interested in the profits either through a profit-sharing arrangement or as a stockholder. In one case, the allowance for salary of the president was reduced from \$20,000 to \$5,000. The reason assigned for the payment of the higher salary was that the president had supplied the necessary funds when needed. However, compensation for such funds was made through the profit allowance because the capital furnished was included in the investment upon which the profit allowance was based. Under the circumstances, an allowance for executive services could be made and \$5,000 appeared to be the maximum allowance which the circumstances warranted. Similarly, the president of a company who owned substantially all the capital stock was paid a salary of \$120,000 per year. This was reduced to \$20,000 for similar reasons.

Bonuses based on profits were generally disallowed, being in effect a distribution of profits and hence not cost of operation. In one case, the executive bonuses amounted to 41 per cent of the general overhead. They were disallowed in all cases where they were not being paid in accordance with contract and where they consist of a voluntary distribution dependent on the profits as determined at the end of the year.

An exception was made where the combined salary and bonus were not excessive compensation for services rendered. Whether the bonus is paid in cash or in stock is immaterial, provided the cash value, rather than the par value, of the stock is the amount charged to overhead.

Taxes in cost determinations.—Income taxes imposed by the United States were excluded as a proper charge against the contractor's profits. The Navy Department can not reimburse a contractor for taxes levied by Congress, such procedure being in effect a refund of the taxes levied and hence contrary to law.

It may also be pointed out that the exclusion of income taxes is essential to avoid the endless circle wherein the greater the tax levied by Congress, the larger the profit to the contractor and the increased profit in turn resulting in an increased tax.

In the case of capital stocks representing ownership of plant facilities used for production, consolidated statements were prepared so that the expenses of subsidiary companies may be properly taken up in costs and their assets and liabilities in the investment. Loss on sale of other securities or shrinkage

in their market value is wholly unrelated to the production of articles purchased by the Navy and was not accepted as a charge. Similarly, income derived from securities, expenses, or interest incurred while carrying securities, or profit obtained on their sale, was excluded from costs.

Depletion in cost determinations.—Where the product being costed involved a reduction in the mineral resources of the contractor through extraction of the mineral, a fair allowance was made for loss in capital values arising from the diminution of the quantity of mineral in the ground. Like depreciation, the original cost of the mineral properties was prorated over the estimated life on the basis of tonnage or time.

Allowance for depletion of sand and gravel and other mineral lands was arrived at by spreading the original cost over the estimated tonnage or life of the property.

The contractor usually submitted claim for depletion allowance based on the appraised value of the beds (generally the market value) rather than original cost, claiming that the original cost did not represent the value to him. This claim was disallowed in the case of a sand and gravel bed, because the present value placed thereon existed merely because of the excessive price obtained for sand and gravel, and it was these prices which were under examination. Market value depends on the profit which can be derived from the sale of the product. Basing the depletion charge on the market value results in an endless circle wherein the higher depletion charge warrants higher selling prices, and the higher selling prices react to increase the market value of the beds.

Local conditions vary so greatly that standard rates of depletion are of little value. In one case, no allowance for depletion was made, because there was no actual depletion in quantity. The gravel beds were constantly replenished through added deposit made by natural action of a mountain stream. The royalty for right to extract product paid on leased beds would be charged to operating expenses. The purchase price of such lease would be spread over the output on the basis of tonnage or term of lease.

Contingencies in cost determinations.—Contingency allowance is intended to cover items of cost which will probably be incurred, but the amount of which is not definitely measurable at the time the examination is made. It was limited to such costs as would be allowed if the amount were known, and it was not intended to allow the contractor an additional profit through an excess charge for contingencies nor to cover general business hazards which were considered in connection with the reasonable profit allowance.

The allowance for contingencies as a flat percentage on prime cost or total cost was eliminated wherever possible, and in place thereof specific allowance made for estimated increase in labor cost, increase in material cost, replacements of defective materials, etc., and allowance invariably showed for what purpose made, and each item was supported by sufficient data to substantiate the reasonableness thereof.

No profit was allowed in the first-mentioned case, where contingency allowance represents a flat percentage on prime cost or total cost. Profit was allowed in the latter case.

Royalties, etc., in cost determinations.—In case of proprietary articles (articles or brands obtainable only from one company), special attention was given to claims for royalties, patent expense, development expense, etc. Unless a royalty was actually paid to a patent holder foreign to the corporation, it was essential that the nature of development and patent expenses be clearly set forth, showing preferably the amount of these expenses by years and whether or not part thereof had been charged off in the past. The question of (a) the validity of the patent, (b) its value, or (c) the reasonableness of the royalty claimed was then submitted to the Secretary of the Navy. Royalty allowances were regarded as extraordinary payments upon which no profit was allowed.

Royalties actually paid to patent holders foreign to the company were given consideration.

Where a royalty was actually paid to officers or stockholders financially interested in a company, information was required as to whether the individual claiming the royalty incurred the development and patenting expenses himself or whether these expenses were actually paid by the company.

Royalty allowance was recommended in a case where the development expenses had not been charged to costs nor included in the investment upon which the profit allowance was based.

Royalties for the use of the company's own patents or paid to a holding company were disallowed when examinations indicated that practically all engineer-

Proportion of this amortization was allowed only where the manufactured article being costed was covered by the patent or manufacturing rights.

Any allowance, either through royalties or amortization, was based on the cash cost of patents and manufacturing rights, and if capital stock was issued, information as to cash value thereof was required.

For the purpose of coordinating the policies of the War Department and Navy Department in patent matters, the Secretary of War and the Secretary of the Navy established a munitions patent board. This board was formed to consider clauses in the contracts of the respective departments dealing with patents, questions as to validity or infringement of patents and patentability of inventions; questions as to the amount of compensation to be paid for patents or for the use of patents and all other miscellaneous questions as to patents which arose, in which the two departments were interested. As to the Navy matters, action of the board was subject to final approval of the Secretary of the Navy.

Where questions as to royalty allowance arose, all patent and development expenses were excluded from overhead if possible and set out as a separate factor. The amount of such expenses was considered in arriving at the royalty allowance. In each case consideration was given to the question as to whether an allowance for profit on such expenditures will be warranted.

Navy-yard accounting.—Examination of the accounting system of several hundred commercial concerns has disclosed the fact that nowhere in the country has more care and study been given to the development of a proper cost-accounting system, with all that means in control, economy, and efficiency, than has been devoted to the navy-yard system.

The natural result of the war was to center attention on those matters which directly pertained to its successful prosecution, and interest in the cost-accounting system was thus overshadowed; but progress was made in the strengthening and developing of this system. A comprehensive classification of expense accounts is in use, from which the expenses of operating and maintaining the various activities of the industrial yards are obtained for administrative purposes.

In order to apply in the most useful way the large amount of information assembled by the industrial-accounting system, authority has been requested to revise the overhead rates charged to the cost of work so as to make them represent the actual industrial overhead expense.

Statistical machines using the punched-card system were installed in the accounting departments at all but one of the continental industrial navy yards and in Supplies and Accounts. These machines have proved to be valuable labor-saving devices in compiling expenditures and cost data. The advantage of the card system over old-style bookkeeping is in the varied analyses that can be made from one set of data simply by re-sorting the cards, whereas under the manual system separate postings and additions had to be made.

Due to the expansion of shore-station facilities incident to the war, it was deemed necessary to establish a method whereby a detailed record of the improvements at each nonindustrial station could be maintained, similar to the method already in use for obtaining a perpetual inventory at industrial yards. Instructions were accordingly issued that all charges for additions and improvements to nonindustrial stations should be carried in a work-in-progress account until a unit is completed when an inventory card is submitted. This inventory card contains, in addition to the cost of the item, a full description of the property.

Stores accounting.—In order to bring all cost and expenditure records more nearly up to date, the rendition of shore-station stores returns monthly instead of quarterly was inaugurated. This resulted in furnishing prompt current information in connection with stock upkeep as to the balance of stores on hand by classes of material.

During the war, a great deal of material was purchased which, due to its special characteristics, was not appropriate to be purchased and carried under naval supply account. The latter is a selected stock of standard materials carried by supply officers ready for instant issue when needed, but not intended

finance account, which had existed for the carrying of special ordnance materials, was expanded to include all special materials purchased directly under appropriations, and its name was changed to the appropriation purchases account. At the same time the total number of stores accounts was reduced by transferring to the used-material account the stores carried under the former survey and condemned-stores accounts.

The turning back of a great deal of material after the armistice before it had been possible for supply departments to entirely account for its issue created a situation which was met by transferring to the accounting officers of the navy yards the principal accounting functions of supply departments, so that these special conditions could be disposed of and the routine hereafter carried on by officers whose primary responsibility while so detailed is accounting instead of by supply officers whose primary responsibility is to procure, store, and issue material. Standard methods of maintaining stock records and inventories were instituted and a standard accounting practice established whereby a bank balance might be struck daily by accounting officers of the operations of the supply departments similar to the daily balances struck by accounting officers in connection with the industrial work of the yards.

The use of estimated prices in expending material when invoice prices are not available was installed, resulting in relieving the congestion of vouchers and accelerating the movement of papers.

The Navy stores accounting subsection was established the latter part of February, 1918, for the purpose of accounting for Government materials purchased for or issued to Navy contractors for fabrication or assembling. Its scope was later broadened until it embraced accounting in connection with sales to allied powers, Shipping Board, and other Government departments; repairs to Shipping Board vessels; adjustable fixed-price contracts, and special contracts; special plant structures and equipment; sale of salvage material; transfers between supply officers and cost inspectors; and importation of raw material. During the period from March 1, 1918, to February 28, 1919, 15,690 vouchers, amounting to \$190,074,620.10, were received and 4,867 expenditure invoices, representing a total value of \$147,326,981.70 were prepared.

Accounting in Europe.—In the fall of 1918, at the request of the commander of the European forces, attention was given to the standardization of accounting practice at the United States naval stations in France and England; but with the signing of the armistice the problems ahead were simplified and resolved themselves largely into matters of payment and distribution of charges of bills rendered by allied Governments, accounting for demobilized material and the establishment at the naval headquarters in London of a central record of appropriation obligations and expenditures.

British claims for supplies and services rendered the United States Navy covered by 20,000 vouchers were accounted for in the London accounting office from November 1, 1918, to April 1, 1919. During this period, the disbursements amounted to \$10,822,271.31 and disallowances on claims amounted to \$128,548.92.

Naval overseas transportation service accounting.—Accounting for the importation of raw materials for naval use and materials furnished Navy contractors for sales of material to allied powers and other departments of the Government and for adjustments with the War Department and Shipping Board on account of cost of maintenance and operation of vessels operated for them by the Navy assumed large proportions.

It was necessary for the Navy to determine freight rates for the transportation on naval vessels of cargo for the Allies, other Government departments, and private parties made necessary by the ocean tonnage situation. The Shipping Board cooperated in this matter as well as in the matter of making settlements with the owners of requisitioned vessels for the value of consumable and non-consumable stores on vessels assigned to the Navy.

The organization of the naval overseas transportation service subsection of the Accounting Division was made necessary when vessels owned by private concerns or owned or commandeered by the Shipping Board, in which commercial and Navy cargoes were carried, were chartered and operated by the Navy and when the Navy began to operate vessels for the accounts of the Shipping Board and War Department.

This subsection acted as an information bureau and published lists to the naval service showing the status of various vessels in the naval overseas transportation service. It also maintained statistical records showing the cost of operation by vessels. One hundred and forty-two requisitions, amounting to \$11,000,000 were prepared covering payment for consumable supplies, charter hire, payments in lieu of repairs, advances to cover traveling expenses of personnel, and miscellaneous items. Of this amount, \$7,000,000 represented charter hire. Only charter hire paid for Dutch and privately owned vessels operated by the Navy for its own account is included in these figures.

Foreign exchange.—Early in the war the foreign exchange situation in South America made it necessary to obtain authority from the Treasury Department to negotiate and account for bills of exchange at the commercial rate, in order not to work a hardship on the officers and men of the Navy by paying them at the mint value, which had been the former practice.

Shortly after the entrance of the United States into the war the foreign exchange situation became such that the Navy Department, upon advice of the Treasury Department, designated foreign depositories in Great Britain, France, and Italy to handle payments made abroad, thus obviating the necessity of Treasury checks being issued abroad and the consequent chance of their loss in transit.

This arrangement also took Treasury checks out of the exchange market, making it easier for the Governments concerned to control the exchange situation and help to prevent violent fluctuations in rates.

The foreign Governments having agreed with the Treasury Department upon a rate at which they would exchange business for a certain month, the placing of funds with these foreign depositories became an easy matter. It required simply a request by cable that the French Government, for instance, place francs to the credit of a Navy disbursing officer with the designated depository. Upon notice by cable that this had been done the equivalent of this amount in dollars was placed to the credit of the French representative in this country by the Treasury Department.

Disbursing officers' accounts.—The indications are that the money expended by disbursing officers during this period of stress has been satisfactorily accounted for, notwithstanding the tremendous volume and pressure of work. Many accounts, however, covering the principal period of activity remain to be examined by the Auditor for the Navy Department; and to simplify the conditions under which relief might be given where losses have occurred without fault of the disbursing officer, or where proper vouchers could not be procured, the naval appropriation act for the fiscal year 1920 provides that items of this kind shall be allowed by the accounting officers of the Treasury on certificates of the Secretary of the Navy.

Total appropriations for the war.—The following statement shows the amount of money made available to the Navy for the prosecution of the war:

Available balance Apr. 1, 1917-----	\$26, 716, 218. 48
Naval act, Mar. 4, 1917-----	516, 607, 387. 08
Deficiency act, Apr. 17, 1917-----	9, 081, 569. 71
Deficiency act, June 15, 1917-----	514, 805, 033. 87
Deficiency act, Oct. 6, 1917-----	561, 483, 059. 29
Public, No. 62, Oct. 6, 1917-----	150, 000. 00
Deficiency act, Mar. 28, 1918-----	63, 569, 809. 25
Public, No. 140, Apr. 26, 1918-----	1, 000, 000. 00
Deficiency act, June 4, 1918-----	25, 907, 000. 00
Naval act, July 1, 1918-----	1, 573, 388, 360. 84
Deficiency act, July 8, 1918-----	8, 322, 208. 24
Public, No. 223, Oct. 17, 1918-----	4, 550, 000. 00
Deficiency act, Nov. 4, 1918-----	107, 928, 043. 69
Deficiency act, Feb. 25, 1919-----	276, 962, 225. 36
Allotted by President from appropriation "National security and defense"-----	1, 883, 408. 90
Total amount appropriated-----	3, 692, 354, 324. 71
Less amount returned to Treasury by second deficiency act approved Feb. 25, 1919-----	334, 360, 446. 65
Net total-----	3, 357, 993, 878. 06

The amounts appropriated were distributed to the various bureaus of the Navy Department as follows:

	Amount appropri- ated.	Amount returned to Treasury by act of Feb. 25, 1919.	Net amount available for expenditures.
Office of the Secretary.....	\$1,195,993,614.05	\$98,000,000.00	\$1,097,993,614.05
Bureau of Yards and Docks.....	223,370,706.57	2,713,627.00	220,657,079.57
Bureau of Navigation.....	81,819,937.43	4,500,000.00	77,319,937.43
Bureau of Ordnance.....	825,314,875.87	164,833,843.69	660,481,032.18
Bureau of Construction and Repair.....	147,322,371.87		147,322,371.87
Bureau of Steam Engineering.....	110,014,296.59		110,014,296.59
Bureau of Supplies and Accounts.....	839,583,354.04	23,096,000.00	816,487,354.04
Bureau of Medicine and Surgery.....	38,032,937.09		38,032,937.09
Marine Corps.....	204,186,012.72	41,216,975.96	162,969,036.76
Amount available Apr. 1, 1917.....			26,716,218.48
Total.....	3,665,638,106.23	334,360,446.65	3,357,993,878.06

The fund made available for the use of the Navy during the period from April 1, 1917, to June 30, 1919, amounted to \$3,357,993,878.06. Assuming that the expenditures for the Navy on a peace basis during this period would have continued to increase at the same rate as during the decade from 1907 to 1916 in which time the annual cost of the Navy grew from \$98,392,144.07 to \$152,-821,540.67, the total expenditures for the Navy on a peace basis from April 1, 1917, to June 30, 1919, would have been \$375,598,947.77. Deducting from this the total available amount of \$3,357,993,878.06 shows that the additional amount of money required by the Navy on account of the war was \$2,982,394,930.29.

SAMUEL MCGOWAN.

A.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., April 20, 1916.

To: Commanders in chief, commanding officers, and commandants.

Subject: Reported maximum stowage capacity of individual vessels.

1. The attached tables, showing the maximum stowage capacity of provisions, clothing, and naval-supply account stock, have been compiled from figures furnished by the commanding officer of each ship listed.

2. These tables are for the information and guidance of all concerned, and have been prepared for the special purpose of providing commandants with an accurate basis for estimating the quantities of each kind of supplies that will be needed to completely fit out for sea all vessels basing on the yards under their command.

3. While there may be slight disparities in some of the figures (where sister ships are shown to differ from each other in regard to the quantities of supplies they can carry), the tables will be used as a basis for fitting out the fleets, and should be of material assistance to commanders in chief in arriving at a correct estimate of the situation with respect to logistics.

SAMUEL MCGOWAN.

¹In order that all ships when fitted out for sea will have at least a 30 days' supply of meats, vessels whose cold storage capacity is inadequate to carry enough refrigerated meats to last that length of time will take such tinned meats as, added to the maximum quantity of refrigerated meats possible to stow, will be sufficient for 30 days.

B.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., June 22, 1915.

To: All commanders in chief, commanding officers, and commandants.

Subject: Fitting out the fleet—provisions.

The following quantities of individual articles of provisions required to subsist for 30 days the number of persons stated opposite each are averaged from itemized reports recently received from 21 battleships of the Atlantic Fleet and 21 smaller vessels—the figures in all cases being practically in agreement with the quantities actually expended during 10 months of the battleship cruise around the world:

	1,000.	2,000.	3,000.	4,000.	5,000.	6,000.	7,000.	8,000.	9,000.

SAMUEL MCGOWAN,
Paymaster General of the Navy.

C.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., July 31, 1915.

To: All commanders in chief, commanding officers, and commandants.
Subject: Fitting out the fleet—provisions; weights and cubic dimensions of.

1. Supplementing the 30-day provision list printed in circular letter No. 421-12, dated June 22, 1915, there are furnished herewith nine tabulated statements showing the weights, tare, cubic dimensions, and number of packages for 30 days' supply of provisions for the respective numbers of persons stated thereon (1,000 to 9,000, inclusive).

2. The figures in the first column of each sheet are taken from the 30-day provision list mentioned; and the next column, headed "Net full package weight," shows the quantity of each item that will actually be delivered, to avoid the use of broken packages.

3. It will be noted that the weights given to the nearest full package of the various items for all numbers above 1,000 have been determined by using 1,000 as a basis; whereas the maximum variation between the quantity actually required and this quantity figured to the nearest full package could, if desired, be always kept within the weight of one package. If this were done, however, there would necessarily be a slight shortage when the provisions were issued to several ships; so that, in order to as far as possible avoid this, the figures given for from 2,000 to 9,000 men contemplate a division into lots of 1,000 men each.

S. MCGOWAN.

1 Cubic feet per long ton.

D.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., July 30, 1917.

To: Commanders in chief, division commanders, commanding officers, and commandants.

Subject: Supply ships; cargo list of N. S. A. stores.

1. The attached cargo list for supply ships represents the quantity of stock which should ordinarily be carried by these vessels when leaving supply yards in so far as storage facilities permit.

2. This stock is carried for the purpose of supplying vessels of the fleet which have been unable to secure ordinary stock replenishment from the supply yards within a reasonable time, and to meet emergencies which have resulted in excessive and unforeseen demands on the vessel's normal stock. Issues are not to be made on account of ordinary stock replenishment. All vessels are presumed to take on board from the supply yards the maximum amount of stock which may be carried, and replenishment of this stock should be secured from the supply yards in so far as may be practicable.

3. The column "On hand" will be used in submitting reports when required of the quantity actually available for issue, which information may be required from time to time by proper authority. In submitting these reports supply ships will note in the "Remarks" column the trade name of lubricating oils carried in stock.

4. The accompanying list has been prepared upon the recommendation of the various bureaus and the commander in chief of the Atlantic Fleet.

SAMUEL MCGOWAN.

(Substitute this for class 40, previously furnished, and destroy original.)

[Issued August, 1918.]

CLASS 40.—TOOLS, MACHINE, AND ALL ACCESSORIES, OUTFITS, AND PARTS.

DEFINITION.

"Machine tool: A machine carrying a tool, as a cutter or die or other shaping implement, or one of which the tool is a part, for performing any of various cutting or shaping processes in metal or wood working; opposed to hand tool."—Standard Dictionary.

NOTES.

1. *Philadelphia catalogue list*.—Attention is invited to the following Navy Department publication: "Catalogue of tools for the United States Navy manufactured at the navy yard, Philadelphia, Pa." In preparing requisitions for tools, the "Instructions for ordering tools," on page 3 of the above-named publication, should always be followed.

2. *Spare parts, pneumatic tool*, are not carried in stock at navy yards, but are covered by annual contracts. These contracts provide for the supplying of spare parts for all pneumatic tools of the contractor's manufacture, which were, at the beginning of the term of the contract, the property of the Government.

Spare parts procurable under annual contracts will be ordered by the supply officers of navy yards and stations concerned. After inspection and acceptance the delivery will be covered by public bills which will be forwarded to the supply officer, navy yard, New York. Orders shall not be placed for spare parts not priced in catalogues, i. e., items listed as "prices on application." Such spare parts shall be requisitioned.

"Such spare parts as may be required for Ingersoll-Rand chipping hammers and riveting hammers now the property of the department should be obtained under separate requisitions to be submitted by the respective yards requiring them." (End. Bu. C. & R., N. S. A. 137 Bu., Feb. 4, 1916.)

Arbors (Carbon-steel, shell-reamer).

F.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., June 1, 1916.

To: Commanders in chief, commanding officers, and commandants.

Subject: Fitting out the fleet—clothing and small stores.

1. The attached tables show the quantities of clothing and small stores required for 100,000 men for six months summer and six months winter after they have been originally outfitted. They do not and were not intended to show the articles and quantities of uniform and clothing necessary to fit out new recruits.

2. While the tables were originally compiled for the purpose of showing what articles and the quantities of each it would be necessary to place on cargo ships to keep the fleet and its train supplied whenever it should be mobilized and required to keep the sea for an indefinite time, they will also be a useful guide to supply officers of individual ships when fitting out for sea. Commandants will likewise find the tables of service in estimating the clothing and small stores required to fit out the fleet units basing on the yards under their command.

3. When the tables are used by individual ships or by those who wish to obtain an estimate for 1,000 men or less the ciphers in light type in each item quantity should be ignored, the remaining figures in bold type showing the quantities for 1,000 men. The entire item quantity need be used only when figuring on supply-ship cargoes, or under other circumstances where 100,000 men are concerned.

4. When using these tables for loading supply ships the following instructions will be adhered to: If, by reason of a shifting zone of operations, both summer and winter clothing is to be loaded on supply ships, the small quantities of winter items shown in the summer list will be omitted, these negligible quantities of winter clothing being included in the summer list only when it is not proposed to take cargo quantities of winter clothing. For example: When the summer list and the winter list, as shown in the tables are to be loaded, but one item of woolen blankets will be taken, i. e., the winter quantity of 13,800 blankets—the 2,600 blankets shown in the summer list being ignored. If the summer list only is to be taken the 2,600 blankets will be loaded and the 13,800 blankets will not. In other words, no item will be duplicated and one quantity only will be taken, either the summer quantity or the winter quantity; but not both.

SAMUEL MCGOWAN.

Clothing and small-stores list—six months' supply for 100,000 men, summer and winter.

Articles.	Clothing and small stores for 100,000 men 6 months summer.	Full package quantity.	Number of packages.	Cubic feet per package.	Total cubic space required.	Clothing for 100,000 men 6 months winter.	Number of packages.	Total cubic space required.

¹ Owing to the variable demand for badges of the different ratings, it has not been practicable to establish a definite percentage of issues for each rate; but as a guide for ships in making individual requisitions, the quantity should be based on allowing two badges for each man of every rating prescribed for the ship's complement entitled to wear a badge.

Summary of supply ships.

Cubic feet occupied by:

Six months' summer clothing and small stores-----	92, 187
Six months' winter clothing-----	62, 206
	<u>154, 393</u>

Articles that will not be carried if a cargo of both summer and winter clothing is loaded (winter articles in summer list)----- 28, 868

Cargo of summer clothing and small stores and winter clothing----- 125, 525

Usual quantities in which various sizes of clothing are required.

[The figures shown opposite the sizes of the various articles are the quantities of the individual sizes as they come in bales of "regulars," with the exception of caps, the quantities of the various sizes for which are based on lots of 100, as they do not (except cloth caps) come in other than packages of one.]

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., November 24, 1916.

To: Commanders in chief, commanding officers and commandants.
Subject: Provisions for destroyers—45 days for 90 men.

1. The following table showing the quantities of all articles of provisions necessary to adequately subsist 90 men for 45 days has been compiled in the Atlantic torpedo flotilla under the direction of the flotilla commander and is printed for the information and guidance of all concerned.

2. When it becomes necessary, in time of stress or otherwise, for destroyers to be independent of the usual sources of supply for the maximum time possible, they will, when fitting out with provisions in anticipation of such duty, follow as closely as practicable the quantities of the various items given in this table.

3. The table contains some slight variations from the figures as originally submitted on account of the necessity for issuing unbroken packages; so that, while a decrease in the quantities of some items and an increase in others has resulted, it will be found that in general the quantities are more than sufficient for the complement of the average destroyer for the period stated.

SAMUEL MCGOWAN.

H.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., October 30, 1919.

To: All commanders in chief, submarine division commanders, submarine division supply officers, and commanding officers of submarines.

Subject: Provisions for submarines.

Reference: Submarine provision list, dated August 1, 1917.

1. These provision lists have been compiled with the assistance of a plans committee of submarine officers and are published as a guide to commanding officers of submarines and supply officers of submarine divisions when laying in provisions for an extended cruise from base of supplies.

2. No attempt is made to form a standard menu for short cruises when fresh provisions can be provided, as these may vary with the seasons and local markets and are influenced by the circumstances of service, commissary equipment, and skill of personnel of the submarine. Five days may be the longest period that fresh provisions requiring refrigeration can be depended upon. For longer periods of operation and for small submarines with limited equipment and storage for fresh provisions, a standard menu is established. This menu is designed for a five-day period and consists of provisions other than fresh, which will keep indefinitely and are easily prepared; for a longer period the cycle is to be repeated. The menus are laid down for hot and cold climates, meat being served three times a day in cold weather but in warm weather only for supper, which is the most extensive meal of the day. The unit is the quantity required for one man for one meal.

3. In order that the quantities of food may be adequate and uniform and that the ration may be balanced, commissary officers will adhere to this standard menu and supply officers of submarine tenders will be responsible for maintaining sufficient stock to permit of issues in the proportions given. Substitution will not be made except when impossible to secure articles listed.

4. The supply officer of the division will check officers' accounts for meals furnished to them from the general mess. Each meal will be charged for at one-third of the daily ration allowance for submarine cruising away from bases or tenders. A list of the officers so checked, showing the number of days or fractional part of a day subsisted and the amount checked, will be forwarded with the quarterly provision return.

SAMUEL MCGOWAN.

Type menus—five-day cycle.

I.

NAVY DEPARTMENT,
BUREAU OF SUPPLIES AND ACCOUNTS,
Washington, D. C., August 1, 1917.

To: All commanders in chief, commanding officers, and commandants.
Subject: Provisions for submarines.

1. These provision lists have been compiled by a board convened for that purpose by the submarine force commander and are published as a guide to commanding officers of submarines when laying in provisions for a cruise of maximum duration away from a base of supplies.

2. It will be understood, of course, that adherence to the particular articles on these lists is not mandatory, any other articles allowed by regulations and suitable for the purpose being permissible in substitution therefor; but these lists will be a dependable guide both as to articles and quantities whenever a protracted cruise is contemplated.

3. The lists were made up for 5, 10, and 15 day periods, so that there might be at hand for all classes of submarines a provision list for the period of time best suited to their individual maximum provision carrying capacity. In addition to these lists, the board has prepared a menu which should be followed almost exactly both as to quantity and day and meal of serving to insure the best results when provisions identical with the lists are taken on board. The board, in preparing the lists, made proper allowance for some unavoidable waste.

4. Ample quantities of the articles shown on the provision lists will be carried on board submarine tenders and at submarine bases for issue to individual submarines when required.

SAMUEL MCGOWAN.

RATION FOR ONE MAN.

First day.—Breakfast—1 orange, 3 eggs, 4 ounces bacon, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup, ½ pound beef (fresh), 8 ounces potatoes, 6 ounces peas, 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces beef (fresh) in 1½ ounces rice and curry, 3½ ounces gingersnaps, 5 ounces toast, ½ ounce butter, 2 ounces jam or marmalade, ½ ounce coffee.

Second day.—Breakfast—1 orange, 8 ounces corned-beef hash, sufficient catsup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—12 ounces beef roast (fresh); 8 ounces potatoes, 4 ounces spinach (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces beans (tinned), sufficient catsup, 4 ounces prunes (tinned), 5 ounces toast, ½ ounce coffee, ½ ounce butter.

Third day.—Breakfast—1 apple, 3 eggs, 1 ounce cereal, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—8 ounces tinned corned beef, 8 ounces potatoes, 6 ounces corn (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—2½ ounces soup (tinned), 8 ounces ham (sliced cold), 5 ounces tomatoes (tinned), 1 ounce peanut butter, 3½ ounces gingersnaps, 4 ounces figs, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Fourth day.—Breakfast—1 orange, 2 eggs, hot cakes with Karo sirup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces tinned condensed soup, 6 ounces boned chicken (tinned), 8 ounces potatoes, 6 ounces peas, 6 ounces pineapple (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces spaghetti (tinned), 4 ounces salmon (tinned), 6 ounces peaches (tinned), 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Fifth day.—Breakfast—1 orange, 1 egg, 6 ounces corned-beef hash, sufficient catsup, 5 ounces bread toast, ½ ounce butter, ½ ounce coffee; dinner—8 ounces ox tongue (tinned), 8 ounces potatoes, 6 ounces tomatoes (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces beans (tinned), sufficient catsup, 4 ounces prunes (tinned), 5 ounces bread, ½ ounce butter, ½ ounce coffee, 4 ounces dates, 3½ ounces gingersnaps.

Sixth day.—Breakfast—1 apple, 1 ounce cereal, 3 eggs, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—6 ounces boned chicken (tinned), 8 ounces potatoes, 6 ounces corn (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—4 ounces sardines (tinned), 3½ ounces crackers, 1 ounce peanut butter, 4 ounces prunes (tinned), 5 ounces bread toast, ½ ounce butter, ½ ounce coffee.

Seventh day.—Breakfast—1 apple, 3 eggs, 4 ounces bacon, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—6 ounces roast beef (tinned); 8 ounces potatoes, 6 ounces peas (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces spaghetti, 4 ounces salmon (tinned), 6 ounces peaches

(tinned), 5 ounces bread, 3½ ounces gingersnaps, ½ ounce butter, 4 ounces figs, ½ ounce coffee.

Eighth day.—Breakfast—6 ounces apricots (tinned), 4 ounces omelette (from fresh eggs), 1 ounce cereal, 5 ounces bread toast, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 8 ounces corned beef (tinned), 6 ounces tomatoes (tinned), 8 ounces potatoes (fresh), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—4 ounces chipped beef (tinned), 2 ounces rice, 6 ounces pineapple (tinned), 3½ ounces crackers, 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Ninth day.—Breakfast—6 ounces apples (tinned), 4 ounces omelette (from fresh eggs), 4 ounces bacon, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 6 ounces boned chicken (tinned), 2 ounces macaroni, 6 ounces string beans (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—6 ounces luncheon meat (tinned), 6 ounces asparagus (tinned), 4 ounces prunes (tinned), 1 ounce peanut butter, 3½ ounces crackers, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Tenth day.—Breakfast—6 ounces pears (tinned), 4 ounces omelette (from fresh eggs), hot cakes with Karo sirup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 6 ounces roast beef (tinned), 8 ounces potatoes (fresh), 6 ounces corn (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—4 ounces codfish (tinned), 2 ounces rice, 6 ounces apricots (tinned), 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Eleventh day.—Breakfast—6 ounces peaches (tinned), 8 ounces corned-beef hash, sufficient catsup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 8 ounces ox tongue (tinned), 6 ounces peas (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces spaghetti (tinned), 4 ounces salmon (tinned), 6 ounces apples (tinned), 3½ ounces crackers, 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Twelfth day.—Breakfast—6 ounces apricots (tinned), 4 ounces omelette (from fresh eggs), 1 ounce cereal, 5 ounces bread toast, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 8 ounces corned beef (tinned), 6 ounces tomatoes (tinned), 8 ounces potatoes (fresh), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—4 ounces chipped beef (tinned), 2 ounces rice, 6 ounces pineapple (tinned), 3½ ounces crackers, 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Thirteenth day.—Breakfast—6 ounces apples (tinned), 4 ounces omelette (from fresh eggs), 4 ounces bacon, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 6 ounces boned chicken (tinned), 2 ounces macaroni, 6 ounces string beans (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—6 ounces luncheon meat (tinned), 6 ounces asparagus (tinned), 4 ounces prunes (tinned), 1 ounce peanut butter, 3½ ounces crackers, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Fourteenth day.—Breakfast—6 ounces pears (tinned), 4 ounces omelette (from fresh eggs), hot cakes with Karo sirup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 6 ounces roast beef (tinned), 8 ounces potatoes (fresh), 6 ounces corn (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—4 ounces codfish (tinned), 2 ounces rice, 6 ounces apricots, 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Fifteenth day.—Breakfast—6 ounces peaches (tinned), 8 ounces corned-beef hash, sufficient catsup, 5 ounces bread, ½ ounce butter, ½ ounce coffee; dinner—2½ ounces soup (tinned), 8 ounces ox tongue (tinned), 6 ounces peas (tinned), 6 ounces bread, ½ ounce butter, ½ ounce coffee; supper—8 ounces spaghetti (tinned), 4 ounces salmon (tinned), 6 ounces apples (tinned), 3½ ounces crackers, 2 ounces jam, 5 ounces bread, ½ ounce butter, ½ ounce coffee.

Secretary DANIELS. Now, not only, Mr. Chairman, in business matters has the Navy Department made a record, but has won the approval of business men, and in other ways shown that it was worthy of the commendation it has received at home and abroad, but long before the war—in fact, in 1914—the Navy Department was keen about educating the young men in the Navy and providing for the best and healthiest moral environment.

Under the administration of President McKinley, Secretary Long issued an order forbidding the sale of alcoholic liquors to enlisted men. On July 1, 1914, I issued an order, upon the recommendation of the Surgeon General of the Navy, abolishing the wine mess on board of ships and stations of the United States Navy. That order made the same rule apply to officers as already applied to enlisted men. The criticism which the wine-mess order received soon died out, and in our Navy it has come to be regarded by the officers, who first objected to it, as a wise regulation. That order is General Order No. 99, and is as follows:

General Order No. 99.

NAVY DEPARTMENT,
Washington, D. C., June 1, 1914.

Change in article 627, Naval Instructions (99).

On July 1, 1914, article 827, Naval Instructions, will be annulled, and in its stead the following will be substituted:

"The use or introduction for drinking purposes of alcoholic liquors on board any naval vessel, or within any navy yard or station, is strictly prohibited, and commanding officers will be held directly responsible for the enforcement of this order."

JOSEPHUS DANIELS,
Secretary of the Navy.

But, of course, this step caused criticism in and out of the Navy. When convinced that it was a sound policy I issued the order, and the fact it has received almost universal approval testifies to its wisdom. It was preparedness in peace and demonstrated its wisdom in war. When issued, however, the aid for Operations, Rear Admiral Fiske, retired, among others, was so hostile to the order that he persistently sought to induce its revocation. The reasons he advanced were wholly unsound and reflected unjustly upon the officers of the Navy. Inasmuch as this order has been the subject of so much criticism, at first adverse and later in commendation, I will insert the letter of Rear Admiral Fiske, for it contains the whole argument of the opposition. He wrote as follows.

I call particular attention to one statement, on page 7, in this letter, in which he said that if this order stood, among other bad effects which he prophesied, which have not come to pass:

Another effect would be the increased temptation to officers to secrete whisky in their rooms.

I regarded that then, and regard it now, as an unjust reflection on the officers of the Navy. I knew their temper and their character, and I knew that they would obey the regulation and that there never would be any trouble by reason of officers secreting whisky in their rooms. I do not know that any civilian or officer has ever made such a severe and unjust reflection upon naval officers as this, except the following. Admiral Fiske also said:

Another effect would be an increased temptation to use cocaine and other drugs. This danger is real, not imaginary.

That was an absolutely unjustified and unfounded aspersion upon the officers of the Navy. There was no warrant to suppose that because the department had issued an order forbidding intoxicants on board ships of the Navy or at naval stations, naval officers would use cocaine and other drugs. History has shown that Admiral Fiske's statement that it was really not an imaginary danger, was not correct. It was wholly imaginary, in his mind; never real; and officers of the American Navy were never at any time disposed to indulge in the use of cocaine and other drugs, because of General Order No. 99.

The letter of Admiral Fiske is here printed in the record as follows:

NAVY DEPARTMENT,
Washington, May 27, 1914.

From: The Aid for Operations.

To: The Secretary of the Navy.

Subject: Prohibition of wine and beer in ships and at naval stations.

1. Referring to our verbal conversation of May 22 on this subject, and to your permission to speak to you further on the subject, I beg leave to present my views in writing, as I can do so more concisely than by word of mouth.

2. I know that I do not speak for myself alone, but that I voice the belief of more than 95 per cent of the officers of the Navy, including many officers who are total abstainers, and not excluding chaplains of experience. I am sure that my opinion is shared by the officers of the Army; and so far as I can judge from what is said to me and written to me by civilians, both in public life and private life, my opinions are those of a very large majority of the influential people of the country. The evil effects of the abolition of the "canteen" in the Army are too well known to need more than a mention.

3. In my opinion the prohibition of wine and beer on board ships and at naval stations would be a very serious mistake for the following reasons: (a) Such prohibition is unnecessary; (b) It would not increase the temperateness of the officers; (c) it would not increase the difficulties of maintaining discipline; (d) it would impair the military efficiency of the service.

4. Referring to (a), I think the prohibition unnecessary because, while there are many causes which prevent the efficiency of the Navy from reaching the mark naval officers all aspire to, intemperance is not one of them.

The officers of the Navy are the only body of men who study its welfare profoundly, not superficially. Enlisted men for the most part continue in the service but a very short time, but the officers of the Navy spend their lives in the Navy, and in some cases their fathers and grandfathers did before them. Many civilians take an active interest in the Navy; but their interest, while sincere and patriotic, can not reasonably be expected to inform them as to what is best for the service. Most of them recognize the fact that the Navy is a profession as clear cut as that of medicine, so that its officers are the only ones who can know what is best for the peculiar conditions in the Navy. In all of the discussions of the Naval Institute and the War College, and in other meetings of naval officers, I can not recall a single instance in which intemperance was mentioned as a factor existing in such a degree as to injure the efficiency of the Navy.

5. In this connection, I beg leave to call the attention of the Secretary to the following statement in the published letter of the Surgeon General:

"The prohibition of alcohol to the men has rendered alcoholism among them almost a negligible quantity. Surely the officers should be in all respects models for the enlisted men in duty, habits, and deportment; and the examples of officers drinking on board ships, as fostered by the wine mess, and the numerous courts-martial of officers for drunkenness and the effects of alcohol are destructive of discipline and morale, bad for the enlisted men, and detrimental to the reputation and good name of the service."

This statement was published in many newspapers, practically all over the United States. I think I am not wrong in saying that there went into the mind of every person who read this statement—man, woman, or child—an impression that the officers of the United States Navy drank more than they should and that the Surgeon General of the Navy found it necessary to call the attention of the Secretary to the fact. The reputation of the Navy suffered in the minds of every single person who read that statement; every single officer in the

United States Navy was injured by that statement. The only possible justification for the statement and for its publication throughout the world would be that the statement was true. If the statement were true, I would have nothing to say, and the officers of the Navy and their friends and families would feel no sense of indignation; but the statement is not true. "Alcoholism among the enlisted men" is not "a negligible quantity." Officers are "models for the enlisted men in duty, habits, and deportment." "The examples of officers drinking on board ship, as fostered by the wine mess," have not resulted in "numerous courts-martial of officers for drunkenness," and "the effects of alcohol" (as used on board our ships) are not "destructive of discipline and morale, bad for the enlisted men, and detrimental to the reputation and good name of the service."

Drunkenness exists among enlisted men in a very much greater degree than among the officers. The large majority of offenses of all kinds punished on board our ships are caused by drinking by enlisted men. Nearly all of this drinking is done on shore and can not be controlled by naval regulations. The fact that an enlisted man is not now allowed to have one bottle of beer on board for dinner (only one was allowed formerly, brought alongside in port by the bum-boat) has not improved their sobriety, because it can not alter at all the fact that the one bottle of beer never made a man drunk or intoxicated, and the men can get drunk (and very drunk, indeed) when they go ashore. As to the officers, careful observation and comparison have led me to the conclusion that there is less intemperance among them than among an equal number of men of like station in civil life.

6. Regarding (b), I have never known a case of drunkenness aboard ship due directly to the wine mess. People rarely get drunk on wine or beer. It is difficult to do so. In practically every case, when an officer has become intoxicated, it has been on whisky, or something like whisky, such as brandy, and usually on shore. This being the case, the prohibition of wine and beer on our ships will not decrease the amount of drinking of whisky but will tend to increase it, for the obvious reason that officers desiring to drink will go ashore and drink strong cocktails, with no official restraining influences, instead of staying aboard ship and drinking wine or beer under the eyes of brother officers and amid conditions distinctly discouraging to excess.

7. Regarding (c), the effect of the suggested order would be to divorce officers from their ships—a very unfortunate effect, because we have always tried to get officers to regard their ships as their homes.

Another effect would be the increased temptation to officers to secrete whisky in their rooms, and to drink whisky (a most dangerous thing) instead of wine or beer. Another effect would be an increased temptation to use cocaine and other drugs. This danger is real—not imaginary. Many people crave stimulant of some sort, and if they can not get what they prefer will take anything they can get. Cocaine takes up little space and is very convenient. Its use among enlisted men has increased since they were prohibited the daily bottle of beer.

8. Regarding (d), I most respectfully call the attention of the Secretary to the fine state of efficiency of naval officers at present, as shown by their splendid work in Mexico within the past month. This is due to the fine spirit of the officers themselves. Without this spirit no amount of regulations can avail. This spirit is a very fine spirit and a beautiful spirit; and anything that impairs it will injure the service. Napoleon has been quoted as replying to a colonel who was excusing some poor work by complaining of the bad quality of his regiment, that "there are no poor regiments, but often poor colonels." This was his method of stating that as the leaders are—the officers—so will be the followers—the men. This is more distinctly true of a navy than an army, because a ship's officers and men are much more bound up together than a regiment is; and the efficiency of the ship flows directly from the spirit of its officers.

9. To hold our officers up to the country as a body of men lacking in the self-control necessary for the performance of their duty, which would be done by making an order of the kind suggested, would be to strike directly at their dignity as men and lower their pride in themselves and their calling.

10. The enthusiasm and cheerful obedience necessary to the best efficiency have never been attained by such methods. The officers of the Navy are a dignified and high-minded set of gentlemen. Their ideals and standards will compare more than favorably with those of average men in civil life. Such of them as I have heard speak about the suggested order regard it as an un-

merited indignity, an act of disrespect to a set of men most of whom are of settled (and good) habits, and many of whom have grown gray in their honored profession.

11. This being the condition, it must follow that the effect of this order, if issued, will be to impair efficiency, a sense of injustice always does. Great efficiency can exist only when mutual liking and confidence prevail. And while the officers of the Navy may always be relied upon to do their duty, they may be the more relied upon for initiative and zeal if their pride in themselves is not weakened.

12. As a very minor matter, there would be the inconvenience which the proposed regulation would cause in intercourse with foreign diplomatic, military, and naval officials. Whether right or wrong, the world custom is to use wines in the exchange of official courtesies. Our officers, if the proposed regulation is issued, will be placed in the embarrassing dilemma of either declining a glass of wine when tendered as an ordinary and usual courtesy by a well-meaning foreign host, or of accepting the wine—international custom exacts that it shall be accepted, even if not drunk—knowing that when the courtesy is returned, as it must be, whether in the form of a call or a dinner, he will be unable to respond in the same manner—in the manner made usual among the politer nations.

B. A. FISKE.

WHY THE ORDER WAS ISSUED.

Of course, when Admiral Fiske in person and by letter urged the revocation of the order he found that I was courteous in giving him a hearing but adamant to his pleas, because I had no doubt then, and am stronger in the belief with every day, in the wisdom of General Order No. 99. Why was the order issued? In an address at a banquet in New York on the 16th day of April, 1914, I said:

I have recently issued an order abolishing the wine mess. With singular lack of logic critics who see fit to represent me as a foe to discipline on the one hand twist this into a case of discipline run mad on the other. Far greater questions than that of discipline lie back of this. There is no body of more temperate, clear-headed men in the world than our officers; but let me for a moment put the shoe on the other foot and bring the question home in another form to you gentlemen to-night. Of all trades there is probably no finer or more sober or more intelligent, more self-controlled men than our railroad engineers. Upon their sobriety, upon their clearheadedness, upon their capacity to govern themselves depend daily the lives of millions of our citizens. Your life to-day, to-morrow, whenever you leave this city, will for a greater or less time lie in the hollow of the engineer's hand. Many of the railroads have established club houses for these engineers, where they may read, meet, and pass away time between their runs. What say you, gentlemen, you with your railroad tickets in your pockets, to a proposition that the railroads should issue an order that the engineers off duty at these club houses should be allowed to establish a wine mess of their own. Would the fact that 99 per cent or 999 out of 1,000 of these men would take no advantage of such an order and would go to their work the next morning with eyes just as clear and hands just as steady as they were the night before—would that fact do away with the possibility of the one-hundredth man or the one-thousandth man moving the wrong lever at a critical moment or sleepily overlooking the danger signal? Would you not demand an order abolishing such an arrangement? Yet this is precisely a fair comparison. The wreck of a great battleship, the loss of a critical battle, and the honor of our country may easily hinge upon one of many men in the varied and complex duties which these great masses of intricate machinery called battleships have created. Would you take any chances with the engineer of your train? Why, then, should you seriously ask me to take chances with those who direct the movements of our ships?

The order issued was based upon the recommendations of the Surgeon General of the United States Navy, Dr. W. C. Braisted, who came to his present office fresh from the position of fleet surgeon of the Atlantic Fleet. His report is as follows:

"In accordance with your request, based in part upon a perusal of the inclosed copy of an article by Col. L. M. Maus, Medical Corps, United States

Army, on 'Alcohol and racial degeneracy,' I present herewith certain information relative to the alcohol problem—for it is still a problem—in the Navy.

"The use of alcohol stimulants in our service was inherited, with many outgrown customs, at the very birth of the American Navy, and was until comparatively recent years recognized officially, to the extent of issuing a daily allowance of spirits on shipboard. An appreciation of the evils directly and indirectly attendant upon the use of intoxicants, even in moderate degree, has, however, grown steadily in strength within the service itself, fostered, no doubt, by an awakening of public sentiment distinctly unfavorable to intemperance. This is shown by a progressive diminution in the number of admissions to the sick list for alcoholism and by the enactment of legislation tending to restrict the use of intoxicating liquors by all persons in the naval and military services of the United States.

"The Articles for the Government of the Navy, which are based on law, state (art. 13) that 'distilled spirits shall be admitted on board vessels of war only upon the order and under the control of the medical officers of such vessels and to be used only for medicinal purposes.'"

As further showing the trend of legislation the following extract is quoted from section 38 of the act to increase the efficiency of the permanent Military Establishment, approved February 2, 1901: "The sale of or dealing in beer, wine, or any intoxicating liquors by any person in any post exchange or canteen or Army transport or upon any premises used for military purposes by the United States is hereby prohibited."

From the above it must be clear that Congress has plainly set the stamp of disapproval upon the use of intoxicants by persons in the naval and military services. It is therefore of interest to inquire how far the Navy Department, through official orders and regulations, has participated in this movement in the way of reform. Reference to article 827, Naval Instructions, 1913, seems particularly informing, and attention is invited to paragraph 1, which reads as follows:

"Wardroom officers may form a wine mess, of which all commissioned and warrant officers attached to the ship may become members upon the payment of mess entrance fee, but no officer shall be required to become a member thereof. Suitable locker room for wine-mess stores shall be provided when fitting a ship for sea."

No doubt this paragraph conforms to the letter of the law, but it may be an open question as to how far it fulfill these laws in spirit. As matters stand to-day, an enlisted man is, very properly, subjected to severe disciplinary measures if wine or beer be found in his possession on shipboard, yet the same man is constantly aware of the free use of alcoholic liquors on board ship, which is officially permitted to officers and of too frequent derelictions which occur among them in consequence. The prohibition of alcohol to the men has rendered alcoholism among them almost a negligible quantity. Surely, the officers should be in all respects models for the enlisted men in duty, habits, and deportment, and the example of officers drinking aboard ship, as fostered by the wine mess and the numerous courts-martial of officers for drunkenness and the effects of alcohol, are destructive of discipline and morale, bad for the enlisted men, and detrimental to the reputation and good name of the service. The Navy is comparable in many respects to a great business organization, but no efficient corporation in civil life would tolerate such a condition of affairs.

The restricted measures which are now enforced, so far as they go, accord with legislative action, are supported by public opinion and a steady increasing service sentiment, and are based on sound moral and physiological principles. Why, then, are they effective for a part of the personnel only, instead of applying with equal force to the whole? It is difficult to find a satisfactory answer, especially in view of the youth of some of our officers, who may now be commissioned at 22 years of age, and the proposed reduction of the minimum to 20. To assume that even the moderate use of alcohol will better equip them physically for 40 years of active service, or mentally to meet responsibilities of the gravest import, or intellectually to solve problems which may involve our national existence, or morally to represent this country at home or abroad is against all reason. It may be stated as a fact, that except as a temporary expedient to certain cases of illness, the use of alcohol is harmful and its abuse is disastrous alike to the individual and to the human race. Its use in the service is based only upon outworn customs, and there is no authority, by law or otherwise, for its continuance, except as contained in the naval instructions.

You have asked my opinion on this matter and I have expressed it frankly, uninfluenced by prejudice or traditions of the past. In view of the foregoing I find it my plain duty to make the following recommendations:

1. That a general order be issued, in substance as follows:

"On and after July 1, 1914, the use or introduction, for drinking purposes, of alcoholic liquors on board any naval vessel or within any navy yard or station is strictly prohibited, and commanding officers will be held directly responsible for the enforcement of this order."

2. That article 827, Naval Instructions, 1913, be revoked or modified in accordance with the general order specified above.

It is probable that upon certain special occasions international courtesy might render it advisable to temporarily modify such a regulation. This could readily be done by departmental order. At the same time efforts might be made to obtain an appropriation for the entertainment of our foreign guests in a manner which would avoid the possible appearance of criticizing their own customs and regulations.

In announcing the new order to the press I made this statement:

I have issued an order abolishing the wine mess on board all ships and stations in the United States Navy. The order puts into effect the same rule with reference to intoxicants in the Navy which the laws of Congress have imposed on the Army. The Secretary issued this order upon the recommendation of the Surgeon General of the Navy. The order, which goes into effect on the 1st of July, is in these words:

"The use or introduction for drinking purposes of alcoholic liquors on board any naval vessel, or within any navy yard or station, is strictly prohibited, and commanding officers will be held directly responsible for the enforcement of this order."

I am in hearty agreement with the views expressed by the Surgeon General in his paper accompanying the recommendation. There should not be on ship-board, with reference, to intoxicants one rule for officers and another and a different rule for the enlisted personnel. The saddest hour in my official life is when an officer or enlisted man must be punished for intoxication. During the past week it has been my painful duty to approve a court-martial for dismissal from the service of an officer for intoxication. He told me that he had never tasted intoxicating drink until he did so in the wine mess on his cruises. Others who have been disciplined for drinking to excess have made similar statements to me. Officers are now commissioned at the early age of 22 years. Has the Government a right to permit this temptation which too often destroys the highest usefulness of young officers? I think not. If there is one profession more than any other that calls for a clear head and a steady hand it is the naval profession. Experience has shown the wisdom of having no intoxicants on our ships for the young men who enlist. I believe experience has demonstrated that a uniform rule should prevail in the Navy for all who enlist in the service, from the highest rank to the youngest enlisted man or officer who comes into the service, and that the abolition of the wine mess will be justified.

It seems impossible that those who criticize this order are aware of what is going on in the other navies of the world. Surely the action of the German Navy is not to be disregarded, nor the views of Germany's great war lord. For the education of such critics as speak from ignorance I can not refrain from reading to you a few extracts from Emperor William's speech to the naval cadets at Murwick, in which he said that the next war would be won by the nation that did not use alcohol. The German Emperor said:

"I know very well that the pleasure of drinking is an old heritage of the Germans. We must henceforth, however, through self-discipline, free ourselves from this evil in every connection.

"In earlier times it passed for extraordinary cleverness in the youth for him to imbibe a large quantity of alcohol and bear it. I, as a young officer, had occasion to see such examples, but never allowed myself to participate. These are views that suited the Thirty Years' War; but now, no more.

"Entirely apart from the consequences which I need not further portray, I desire to approve you on one point for your future career in the first line. As you yourselves will observe during the course of your term of service on board, the service in my navy has reached such a height of strenuousness as you can hardly surpass.

"To endure these enormous peace exertions without exhaustion and to be fresh in the event of real seriousness depends on you. The next war and the

next sea battle demand sound nerves of you. Nerves will decide. These become undermined through alcohol, and from youth up by the use of alcohol endangered.

"You will later have opportunity to see the target ships and the action of the modern projectiles upon the ships, and therefrom you can picture the conditions during the battle. You will see horrible destruction when you are upon these.

"Here it calls, 'Steady nerves and a cool head!'

"That nation which consumes the least quantity of alcohol wins; and that you should be, my gentlemen. And through you an example should be given the crews.

"And in consequence of this I expect of you that even now, at the naval academy and on board ship, in all comradeship and friendliness in no way disturbed among yourselves, you take heed thereto and provide that the indulgence in alcohol be not counted as belonging to your privileges."

Nor do we have to look to Germany alone for support of this new policy. Surely no man will criticize Admiral Lord Charles Beresford, C. B., as being a man without knowledge or respect of navy customs and traditions, nor as one who has not had opportunity to study carefully this question as he has seen it presented in the greatest navy in the world. Yet this is what Sir Charles Beresford said in his speech at Gibraltar in 1904:

"When I was a young man I was an athlete. I used to box a great deal, ride steeplechases and races, play football, and go through a number of competitive sports and pastimes. When I put myself into training, which was a continual occurrence, I never drank any wine, spirits, or beer at all, for the simple reason that I felt I could get fit quicker without taking any stimulants. Now I am an older man and have a position of great responsibility, often entailing quick thought and determination and instant decision; I drink no wine, spirits, and beer, not because they do me harm, not because I think it wrong to drink, but simply because I am more ready for any work imposed upon me, day or night; always fresh, cherry, and in good temper."

Surely, with this evidence of the attitude of the German Emperor, and the Germany Navy, and the great English admiral, and the 20,000 or more officers and men of the English Navy, it can not be said that my order is either revolutionary or out of line with the spirit of the greatest navies of the world.

This order has been widely commended. Hon. John D. Long, Secretary of the Navy under McKinley, in a recent statement said:

"Secretary Daniels's order is the natural sequence of my own prohibiting liquors for enlisted men in the Navy. (General Order No. 508, issued Feb. 3, 1899.) That was as far as we could go at that time, but in due season it became apparent that enlisted men could not be prohibited from the use of intoxicating liquors and at the same time the officers associated with them and in command of them permitted their use. While some officers may demur at this new order, I suspect that very many will really be glad of it, as was the case with my previous order. To the credit of our naval officers, it must be borne in mind that they are for the most part temperate men of high character, and, while some of them may use liquors moderately, most of them are entirely exemplary in conduct and life.

"Then, too, it can not be denied that this action of the Secretary is making for the cause of temperance at large, especially in Government spheres. With such a serious evil as intemperance, the Government should lead in its suppression. If any complication with foreign officials is involved, the Navy Department will undoubtedly make provision for it. But it is more than likely that foreign vessels will be led by this example to consider and imitate it, so that the drink evil in foreign navies may be put in process of elimination as well as in our own."

The following is a copy of the order to which Secretary Long referred:

General Order No. 508.

NAVY DEPARTMENT,
Washington, February 3, 1899.

After mature deliberation, the department has decided that it is for the best interest of the service that the sale or issue to enlisted men of malt or other alcoholic liquors on board ships of the Navy or within the limits of naval stations be prohibited.

Therefore after the receipt of this order commanding officers and commanders are forbidden to allow any malt or other alcoholic liquor to be sold to or issued to enlisted men, either on board ship or within the limits of navy yards, naval stations, or marine barracks, except in the Medical Department.

JOHN D. LONG, *Secretary.*

From medical sources the commendation has been most gratifying. The Journal of the American Medical Association of April 11, 1914, says:

ALCOHOL BARRED FROM THE NAVY.

Alcohol as a beverage has been barred out of the United States Navy. Following the recommendation of Surg. Gen. Braisted, Secretary of the Navy Josephus Daniels has issued an executive order abolishing all alcoholic liquors from every ship and station of the Navy. The order reads:

"The use or introduction for drinking purposes of alcoholic liquors on board any naval vessel or within any navy yard or station is strictly prohibited, and commanding officers will be held directly responsible for the enforcement of this order."

The significance and extent of the change which has taken place in popular views regarding alcohol, as indicated by this sweeping order of the Secretary, can be appreciated only when one recalls the stories of naval experiences of past generations, when rum, brandy, and whisky formed a part of the official regular rations; when liquor of some kind was served, as a routine procedure, to officers and men before going into action; and when one of the chief characteristics of sailors, whether officers or seamen, was their ability to dispose of an amazing quantity of intoxicants. The development of scientific methods and the use of instruments of precision in warfare have made alcohol absolutely detrimental to the modern navy man. Sea fights in the past were won by brute hardihood and physical endurance, which could perhaps be stimulated, temporarily at least, by large doses of alcohol. The modern warship is a floating laboratory of delicate and accurate machines. The gunpointer, who directs a 14-inch rifle on the modern man-of-war, needs not only personal courage, but also absolute steadiness of nerve, clearness of vision, and fine muscular coordination. All these things modern physiology has shown to be impaired by even small amounts of alcohol. The engineer who superintends the machinery at the heart of the modern battleship, the man at the wheel, who directs its course, and the captain or executive officer on the bridge, as well as the most humble member of the crew, need at all times to be in a condition of maximum physical and mental efficiency. Intoxication in the naval officer to-day might easily be as disastrous as cowardice and treason. Surg. Gen. Braisted's recommendations and Secretary Daniels's order are simply in line with our growing knowledge. The Nation needs on its battleships to-day the most capable, clear-headed, cool-brained, and steady-handed men, and these men are not found among the habitual or occasional users of alcohol in any form. Entirely aside from the moral or sentimental reasons, and considered simply as a scientific regulation in the interest of efficiency, this order will recommend itself to the vast majority of the American people.

Perhaps the best answer, however, is found in the following article written for the Sunday School Times by Mr. Howard A. Banks, who held a responsible position in the Navy Department at the time the order was issued, in which he gives the reasons for issuing this order, and gives my statement at the time. I offer this for the record, Mr. Chairman.

(The matter last referred to by Secretary Daniels is here printed in full in the record as follows:)

The Secretary was smiling across the long room. He rose to greet me with his characteristic hearty handshake. He flung in with a zest a bit of a joke—a quip with plenty of point but no sting. But once he had heard my question, "Why did you issue the wine-mess order?" his expression changed to seriousness. The new *Arizona* could not clear for action more quickly than he, and as grim as the 16-inch guns that shake their clenched fists from her gray

superstructure was the iron purpose in his eyes to keep the Navy clean and white and "dry," as he answered:

"To make it efficient—to make it the most efficient Navy in the world. My wine-mess order was a preparedness measure.

"There was a time when grog was served—when drinking to excess was not uncommon in the Navy. But the temperance sentiment, on the increase within recent years, has changed the Navy as it has changed civilian life. Secretary John D. Long, who held the Navy portfolio under McKinley, issued an order which prevented any enlisted man from drinking a glass of beer on board a warship. There remained, however, the wine mess of the officers. To be sure, it was the exception, particularly among the older officers of the Navy, to become intoxicated."

There was a temptation, however, after a strenuous day on the bridge, or on deck, or below, when wine was served at the wardroom meal, or was to be had from the individual officer's locker, to drink, and sometimes to excess.

One day, shortly after I had become Secretary, a gentleman came into the department to plead for the restoration of a young relative of his who had been dismissed from the Navy for intoxication. I showed him the record, which proved that this young officer had not only been drunk, but had at the same time made a public exhibition of himself. I explained that there was no course to be pursued but to act firmly and finally in approving the court-martial which had recommended the young officer's dismissal.

When I made it plain that the young man must inevitably pay the penalty, this gentleman protested earnestly and with much feeling against what he insisted was the injustice his young relative had received at the hands of the Navy. "Now that he is the product of your system," said my visitor, "you have turned him out in disgrace." He then went on to tell me the following story of the young man's life. Said he:

"I am a Friend, a Quaker, and the boy's father was a Quaker. He was a little shaver when his father died, and the lad came into my home, and has always been to me as a son. I never even had so much as a glass of wine in my home, and when the boy left for Annapolis to enter the Naval Academy he did not know what the taste of liquor was like. I gave him to the American Navy, pure hearted, unsullied, believing absolutely in the old-fashioned Quaker ideas in which he had been reared.

"In the seven years you have had him in the Navy you gave him wrong ideas about drinking. You taught him that it was all right for a gentleman to have his toddy. You legalized the wine mess. You had a code that made a youth feel that he was narrow minded if he turned down his glass at the table; but now that my boy has been ruined by you and your system, the Navy kicks him out and puts a stigma on him."

Much more than this he said, but this is the substance of his strictures. He was a strong man, and his feelings for the youth whose drinking had wrecked his life was pathetically deep and genuine. When he went out I could not throw off a stinging sense of justice in his accusation. All day it haunted me that in the discharge of my official duty I had been compelled to approve a decree for which a Navy practice was largely responsible.

For days I was oppressed by the thought that every young man in the Navy, many coming from homes like that described by my Quaker visitor, was subject to similar temptation.

As time went by there were more court-martials—not many, but enough to add to my profound conviction that the old Quaker had pointed me out unerringly the path of duty.

I knew very well what the issuing of the wine-mess order meant. I counted the cost. I know that many officers in the Navy, temperate, honorable, as high-minded as King Arthur's knights, without fear and without reproach, would resent it bitterly; they would feel that the order would convey a wrong impression to the world.

I realized that the order would be assailed by a multitude of people who would regard it as puritanical. I anticipated that the protest against it might reach into the Houses of Congress. But if I was at any time tempted not to take the step for any of these reasons, the reflection that every year there came into the Navy hundreds of young men, some of whom might find their undoing in indulgence, made my duty plain. If I had not issued it I could not have rested with a clear conscience unto this day.

As you know, the storm did break. Some naval officers did fear that the order was a reflection upon them. The penny-a-liners considered it a windfall

for them, and much cheap wit was indulged in at the expense of the order. The cartoonists of some big dailies also considered it food for thought. Tragic pictures they drew of Mumm's Extra Dry, with a frightened look on its face, "walking the plank," to take its doomed plunge into Davy Jones's locker from the deck of a warship, while I, depicted as a tyrant as relentless as Nero, was standing on the bridge, surrounded by weeping officers.

The approval, however, outside of these restricted circles, was general. The order was hailed with so much satisfaction by the fathers and mothers of the country that my mail was doubled and trebled for a month or two. By the time Congress had assembled, those who had thought to attack the order upon the floors of Congress found there was not a man in either House who ever raised the issue. By that time, too, the Navy officers learned that it was far from any thought of mine to reflect upon the service. I took occasion to let the public know that so far as the mass of the officers were concerned there was no need for the order. It was issued to safeguard the young men who were coming into the service. The public well understood that that was the reason and heartily approved it.

As the days went by the order increasingly won over the approval of the officers themselves. To illustrate, one of the ablest admirals of the Navy, a man whose name is known in naval circles all over the world, who is always frank and genuine, told me that he had never known such a revolution in the Navy as had been brought about by the wine-mess order. Said he:

"When you issued the order, I deeply resented it. I felt that the public would take the view that Navy officers were given over to indulgence, and that some formal action was necessary to keep them sober. That is the only reason I would have advanced against issuing it, if my advice had been sought.

"On the very day that you issued the order I had stocked up my closet with the usual wines and liquors, as was customary, to be used when I entertained guests on board ship. I had never been either a drinking man or a teetotaler, but enjoyed a glass of champagne at a dinner party, and on a frosty morning I occasionally took a nip; but I should never have carried intoxicants upon any ship I ever commanded except to entertain some guests in the same manner as they entertained me at their homes or clubs.

"I did not, therefore, like the order. But when I first read it I immediately called the steward and told him to pack up all drinkables and remove them from the ship. To me an order is an order. In my long service, whether I liked it or not, my loyalty to lawful commands has never failed.

"I have had a rare opportunity to observe the feelings of the officers. My own opinion is that the wine-mess order is the wisest thing you have done as Secretary, and if its future were committed to-day to the officers of the fleet the wine mess would never be restored."

The statement of this admiral is typical, I am convinced, of the opinion of the vast majority of the commissioned personnel of the Navy.

Bear in mind that this happened before the war in Europe; before Russia outlawed vodka and France absinthe; before Lloyd-George said that drink was a greater enemy of England than the Germans; before the King of England became an abstainer in order to set a good example for his troops; and before the Congress of the United States forbade the sale of liquor to any man wearing the United States uniform.

Even some of the flippant critics of the order evidently thought better of it since royalty has indorsed it.

The truth is that the world is at last convinced that drink destroys efficiency. Sometimes it takes a long time to do so, but the recent statement of Dr. Mayo that the medical profession would rejoice to see national prohibition is evidence of the long step forward we have taken in the temperance movement. What Dr. Mayo declares to be the sentiment of the medical profession is a complete indorsement of what a distinguished Navy physician said as far back as April, 1914. That physician was Rear Admiral William C. Braisted, Surgeon General of the Navy. If any credit is due for the issuance of that order in the month of July following it must be shared with him. It was not issued by me until, at my request, he had made a report showing its wisdom. In it he said:

"It may be stated as a fact that, except as a temporary expedient in certain cases of illness, the use of alcohol is harmful, and its abuse disastrous alike to the individual and to the human race. Its use in the service is based only upon outworn customs, and there is no authority, by law or otherwise, for its continuance, except as contained in the naval instructions."

SIMS SAID THE NAVY WAS NOT IN THE WAR IN A FIGHTING SENSE—SOME PROOF OF HIS UNFOUNDED REFLECTIONS UPON THE NAVY.

Secretary DANIELS. It was not only before the subcommittee of the Senate Naval Affairs Committee that Rear Admiral Sims reflected upon the real fighting by naval vessels and the valorous service rendered, and the courage of the brave sailors who served their countries amid graver perils than men of the sea ever faced in any previous war. In his testimony before your committee Rear Admiral Sims made the astounding statement that "There was no fighting on the sea," and "Our Navy was not in this war in a fighting sense. We were acting as motor lorries behind the Army, except that we were on the water."

He not only made this statement, which is a grave and unfounded attack upon brave officers and men of the United States Navy serving in the danger zone and either under attack or always in jeopardy of the submarine stiletto, but, even before the armistice was signed, writing to M. Egan, Esq., at Paris, in answer to reports that we were not in complete sympathy with Gen. Pershing, Admiral Sims said:

There is really no naval war going on.

He wrote that statement to a gentleman in Paris, in spite of the report made in the "Summary of the United States naval forces operating in European waters," prepared in the London naval headquarters of which Admiral Sims was the head, that "a total of 256 attacks by United States vessels occurred," and "in 183 of these cases there was definite chart evidence of a submarine in the vicinity." Disregarding the numerous reports of sighting submarines or periscopes, the record of the armed-guard section reports 227 encounters of armed American merchant ships with submarines, in 193 of which the attacks were successfully combated. Thirty-four U-boats were reported damaged by armed-guard gunfire, of which there was evidence that several were sunk. Of the 227 encounters 44 were surface engagements, some of them long continued gunfire contests. The crews of our destroyers and patrol craft, constantly hunting and often attacking submarines, thought they were fighting, and every ship that passed through the danger zone was always ready for action. All the world, except Rear Admiral Sims, thought the Navy was engaged in war, and in a war where the sea was infested with more dangers, and more insidious ones, than was ever known before. If he had made no other statements inviting the condemnation of the American people this one alone would have insured not only their rebuke but their indignation as well.

In refutation of this statement which does gross injustice to the American Navy, I append a brief and incomplete statement of examples proving that the Navy was in the war "in a fighting sense":

ARMED GUARDS ON MERCHANT VESSELS.

Campana.—Chief Gunner's Mate James Delaney commanding armed guard. Attacked August 6, 1917, by German U-61, a large-type submarine with powerful guns that outranged the *Campana*'s. The *Campana* fought the U-boat 4 hours and 10 minutes, until ammunition was practically exhausted. The U-boat fired over 400 shots; the *Campana* 170. The German captain told Delaney this was the longest gunfire contest he had ever heard of between any ship and

submarine, and that he must take him and the master of the *Campana* to Germany as prisoners to prove that he had had to expend so much ammunition to "get" a single merchantman.

J. L. Luckenbach.—Chief Master at Arms J. B. Trautner commanding armed guard. Attacked 200 miles off French coast October 19, 1917, fought the submarine 4 hours. Early in the engagement a shell from the submarine landed on the forward deck, exploded in gun crew's quarters, started a fire and burst the fire main; in a few moments another shell struck the quartermaster's room. A shell landing near the stern exploded and put the after gun out of commission, but the crew kept up the firing from forward guns. There was a rain of shells, shrapnel falling all around the deck. Two shots landed on the port side forward, striking the oiler's room and putting a large hole in the side. Another landed in the petty officers' messroom, wounding a fireman and a mess boy. One shot passed through the weather screen, landed on the deck in the cargo and exploded. A naval gunner, hit by shrapnel, was seriously wounded. One of the ship's crew who was carrying ammunition forward was hit. A shell exploded in the engine room, wounding the first and third engineers and two oilers and putting the engine out of commission. The submarine fired 228 times, scoring nine clean hits. At 8 o'clock the *Luckenbach* had sent out an S O S call, stating she was being gunned. An American destroyer, a considerable distance away, signalled that she was coming to her assistance. This was the *Nicholson*. Asked how long before she could arrive, the *Nicholson* answered "Two hours." "Too late; look out for boats," radioed the *Luckenbach*. "Don't surrender," said the *Nicholson*. "Never," replied the *Luckenbach*. And though swept by shells, hit time and again and disabled, the ship held out until the destroyer arrived.

Moreni.—Chief Gunner's Mate Andrew Copasski commanding armed guard, attacked June 12, 1917, off Spanish coast. Fought approximately three hours. A shell exploded in gasoline tank, setting the ship on fire. Another shot tore away the steering gear and the ship, beyond control, sailed around in a circle, but the naval gunners kept up the fight until almost the entire vessel was in flames. One man of the merchant crew was killed, one of the merchant crew and one man of the armed guard wounded. During the fight, which lasted over two hours, the *Moreni* fired 150 shots, the submarine about 200. The ship was hit 45 times. A Spanish steamer came up before the submarine left and picked up the survivors. "The submarine called the boats alongside," says the armed guard commander, "congratulated us and told us it was the best fight he had ever seen a merchant ship put up."

These armed guards repulsed scores of attacks, saving their ships, and in not a few instances badly damaging the submarines. Of the 284 ships for which we furnished armed guards, only 34 were sunk by enemy action.

Navajo.—H. L. Ham, chief boatswain's mate, commanding armed guard. In engagement with submarine off Cape La Hogue, France, July 4, 1917, U-boat was reported hit twice, the armed guard's report stating: "The 27th shot struck the submarine just forward of the conning tower, where the ammunition hoist was located, causing an explosion on board the submarine which was plainly heard on the *Navajo*. Flame and gray smoke shot up in the air. The men who were on deck at the guns and had not jumped overboard ran aft. The submarine then canted forward at almost 40 degrees and the propeller could be seen lashing the air. Nobody was seen coming up through the coning tower and jumping into the sea, nor were any survivors seen."

Silver Shell.—William J. Clark, chief turret captain, commanding armed guard. Engagement with submarine in Gulf of Lyons, May 30, 1917, lasted an hour and a half. Both ship's captain and commander of armed guard were convinced that U-boat was sunk. The last shell fired, they stated, hit the submarine, "her bows seemed to raise up, as though there had been an explosion in her, and then she plunged down with her stern up at an angle of 45 degrees." There was not time, the report stated, for the submarine's crew, who were on deck, to get inside before she sank.

Borinquen.—Thomas J. Beerman commanding armed guard. Encounter with U-boat in the Bay of Biscay, October 30, 1917, in which two direct hits were scored against the submarine, which the gunners and crew were convinced was sunk. The commander of the armed guard reported: "The submarine was getting under way, headed for the ship, in the effort to get under the bearings of the after gun. The captain of the *Borinquen* swung the ship around, plac-

ing the submarine directly astern of the ship and in the trough of the sea. The second shot carried away the conning tower of the submarine, which I saw myself. The third shot also hit the submarine, and I saw the explosion which was very distinct. The submarine appeared to stop dead in the trough of the sea after this shot. The last seen of the submarine she was going down on swell, listed to port, with her bow sticking in air and her stern down. She was going down in an upright position."

UNITED STATES SUBMARINE CHASERS IN ATTACK ON DURAZZO

One of the most notable and successful naval actions, after this country entered the war, was the attack on the Austrian naval base at Durazzo, October 2, 1918. In this operation a flotilla of American submarine chasers, under command of Capt. Charles P. Nelson and Lieut. Commander E. H. Bastedo, took a prominent part, leading the way and clearing the path of mines, sinking one submarine and damaging and apparently destroying another U-boat, screening larger ships from torpedo attack, going to the aid of a British cruiser which was torpedoed, and taking under escort an enemy hospital ship, all this under heavy fire during bombardment from the Austrian forts.

The British force commander, in a dispatch forwarded by the British Admiralty to Admiral Sims, wrote:

I am most grateful for the valuable service rendered by 12 submarine chasers under Capt. Nelson, United States Navy, and Lieut. Commander Bastedo, United States Navy, which I took the liberty of employing in an operation against Durazzo on October 2. They screened heavy ships during the bombardments under enemy fire; also, apparently destroyed definitely one submarine which torpedoed H. M. S. *Weymouth*, and damaged and probably destroyed another submarine. During the return voyage they assisted in screening H. M. S. *Weymouth*, and in escorting enemy hospital ship which was being brought in for examination. Their conduct throughout was beyond praise. They all returned safely without casualties. They thoroughly enjoyed themselves.

A dispatch to Admiral Sims from Rome stated:

Italian naval general staff expresses highest appreciation of useful and efficient work performed by United States chasers in protecting major naval vessels during action against Durazzo; also, vivid admiration of their brilliant and clever operations which resulted in sinking two enemy submarines.

ATTACKS BY UNITED STATES NAVAL VESSELS IN EUROPEAN WATERS.

"A total of 256 attacks by United States vessels occurred," says the "Summary of United States naval forces operating in European waters," compiled at Admiral Sims's headquarters in London. Below are given a few examples of such attacks on submarines. These show where our men were meeting perils and meeting them bravely. I offer them for the record.

(The matter last referred to by the witness is here printed in full in the record as follows:)

Fanning, Lieut. A. S. Carpender, commanding, assisted by *Nicholson*: While escorting convoy, at 4.10 p. m., November 17, 1917, Coxswain David D. Loomis, lookout of the *Fanning*, sighted small periscope; *Fanning* headed for the spot and three minutes later dropped depth charge. *Nicholson* also speeded across and dropped another depth charge. At that moment the submarine's conning tower appeared on the surface between the *Nicholson* and the convoy, and the *Nicholson*

fired three shots from her stern gun. The *Nicholson* cleared; the *Fanning* headed for the U-boat, firing from the bow gun. After the third shot the crew of the submarine all came on deck and held up their hands, surrendering at 4.20 p. m. The *Fanning* approached to pick up the prisoners, both destroyers keeping their batteries trained on the boat. The German crew, after surrendering, scuttled their craft. A line was got to the submarine, but in a few minutes she sank, and the crew jumped into the water and swam to the *Fanning*. Though they wore life-preservers, a number of them were exhausted when they reached the destroyer. One could not even hold the line thrown him. Chief Pharmacist's Mate Elmer Harwell and Coxswain Francis G. Conner jumped overboard and secured a line under his arms. He was hauled aboard and every effort made to resuscitate him, but he died in a few minutes. The 4 officers and 35 men of the submarine were made prisoners. The submarine was discovered to be the U-58.

The British commander in chief, Admiral Bayly, under whom the destroyers were operating, commended them in the highest terms, and the British Admiralty stated that, "In their lordships' opinion, the whole engagement of the *Fanning* with the submarine U-58 reflects credit on the discipline and the training of the United States flotillas. The whole affair shows that the *Fanning* is a man-of-war in the true sense of the word. After the depth charge had exploded the submarine was rendered unmanageable and helpless, and had the *Fanning* not been worked with great ability and immediate correct decision she would not only have failed to sink the submarine, but we would have lost the steamship *Welshman* and probably one other convoy."

O'Brien, Lieut. Commander C. A. Blakely, commanding. Had four engagements with submarines in a few months. While escorting steamship *Elysia*, 12 miles south of Ballycotton Light, June 16, 1917, periscope appeared; the O'Brien speeded to the spot; dropped depth bomb; periscope disappeared; oil and bubbles rose to the surface, and big oil slick covered the spot, and was observed long afterwards by British sloop and destroyer. Admiralty charts showed the submarine that was operating in that vicinity disappeared; O'Brien only allied craft that reported engaging it. O'Brien also repulsed submarine which attacked the steamship *Belyic*. Went to rescue of the steamship *Craymore*, which was torpedoed, and assisted in getting her 150 miles to port. Rescued crew of British quarantine ship *Arbutus*, which was torpedoed and sunk. Fired upon and repulsed submarine which was sinking French fishing boats; drove him from larger ship and rescued fishing boat's crew. British Government recommended Lieut. Commander Blakely for distinguished service order for successful engagements with submarines.

Conyngnam, Commander A. W. Johnson. On October 19, 1917, while escorting a large merchant convoy, the *Conyngnam* signaled His Majesty's ship *Orama* and suggested the convoy change its course, as a submarine was reported ahead. This suggestion was not followed, and shortly thereafter a torpedo crossed the *Clan Lindsay's* bow and struck the *Orama* on the port side. The *Orama* immediately listed to port and began to sink by the bow. The *Conyngnam* dispersed the convoy, sounded general quarters, and headed at full speed across the *Orama's* bow, circling the convoy. Shortly thereafter a periscope was seen about 1 foot above the water, but it submerged almost immediately, though the wake was plainly visible.

The *Conyngnam* dropped depth charge over the wake and an explosion resulted, large quantities of discolored water were seen to rise in the air, and a number of officers and crew made out a quantity of wreckage, one piece of which appeared to have been a wireless mast of the submarine. The crew and passengers of the *Orama* abandoned ship, and were picked up by the *Conyngnam* and the *Jacob Jones*, which took the survivors to Queenstown. The British Admiralty expressed their "high appreciation" of the action of the *Conyngnam*, and expressed the opinion that the submarine would probably have sunk another ship had it not been for Capt. Johnson's quick and correct decision. The *Jacob Jones* (Lieut. Commander D. W. Bagley) was also highly commended for the fine feat of seamanship displayed in rescuing survivors from the *Orama* at night when the ship was sinking.

Allen, Commander H. D. Cooke. Engagement with submarine February 2, 1918. Commended in letter from Admiral Sims's headquarters, stating: "Your quick action saved the convoy, and it is believed that the enemy submarine was severely damaged, or even sunk. Such efficient performance of duty is in keeping with the traditions of the United States naval service."

Submarine chasers.—Designed February, 1917. Contracts placed for 355 in March, first one launched in May, completed in June. Additional contracts placed for 92. Delivered before the armistice, 414 (pp. 22 to 32).

Submarines.—At the outbreak of war there were under construction 31 of previous programs and 30 of the three-year program; contracts were placed for 38 more in July, 1917, and for 24 in August, 1918. Forty were completed and commissioned before the armistice (pp. 33 to 39).

Eagle boats.—In the fall of 1917, when listening devices had been developed to a point which promised practical results, a design of a patrol vessel was prepared to give longer radius and more seaworthiness than sub. chasers, and at the same time to be more suitable for quick production in large numbers than the destroyer. Contract was placed for 100 of these vessels in January, 1918, with the Ford Motor Co., which undertook to erect a plant for their construction. The plant was completed and in operation in about 100 days, and the first Eagle boat was completed and in commission in five and one-half months thereafter; that is, in October, 1918. Three were delivered prior to the armistice, after which a portion of the contract was canceled. Even under postwar conditions this plant demonstrated by the delivery of 23 boats in one month that, had the war continued, it could have made deliveries at the rate of 25 per month, which was the figure on which the department had based its plans when the project was first inaugurated (pp. 40 to 52).

Seagoing mine sweepers.—Designed in April, 1917. Contracts for 24 placed in May; for 12 in July; and for 18 in January, 1918. First one delivered in May, 1918. Seventeen were delivered before the armistice (pp. 53 to 66).

Production of seaplanes.—The first requirement upon our entry into the war was training planes, and orders were at once placed for 140, followed at short intervals by orders for 429. These were delivered as rapidly as they were needed for training. In September it was decided that the United States Navy should establish and operate 15 patrol stations abroad. In October orders were placed for 1,420 seaplanes of two types. Altogether, orders were placed for 2,669 seaplanes of these two types or modifications thereof. Of this number 1,611 were delivered and 388 were shipped abroad for service at our patrol stations (pp. 67 to 88).

Design and construction of the NC flying boats.—In September, 1917, after the return to the United States of a commission which had been investigating types of seaplanes and flying boats in use by the Allies, it was found that no type of sufficient cruising radius to perform efficiently many useful military functions had yet been successfully developed. The bureau at once undertook the development of such a design with the ability to cross the Atlantic under its own power as the desideratum to be aimed at. After extended investigations and much detail experimental work, the first of these boats, *NC-1*, took the air on October 4, 1918. The first successful trans-Atlantic air voyage, accomplished by the *NC-4* in the spring of 1919, is now a matter of history.

Naval aircraft factory.—By July, 1917, it was apparent that it would be necessary for the Navy Department to supplement private resources for the construction of aircraft, and on July 27 orders were issued for the erection of a factory at the navy yard, Philadelphia, Pa. The factory was completed in 110 days, but in the meantime, October 17, work was started on its first order for 50 flying boats. The factory was subsequently enlarged and used as an assembly shop, obtaining parts of planes from factories of all characters throughout the country. At the time of the armistice there were 3,740 employees in the aircraft factory. The output up to the armistice was 287 flying boats (pp. 107 to 112).

Air ships.—During 1915 and 1916, experimental design and construction work was prosecuted. In January, 1917, a new design was completed, from which it had been intended to build two ships, but after breaking diplomatic relations, orders were issued to build 16. Despite the fact that at that date there were absolutely no developed building facilities for the construction of lighter-than-air craft in this country, the first ship was completed in May and the remaining 15 within a year. An improved and enlarged type was developed and orders for 30 were placed during 1918 and the first was delivered in September, 1918 (pp. 115 to 132).

Conversion and repair of vessels taken over by the Navy during the war.—This work was continuous and arduous from before the declaration of war until after the armistice and ranged from complete rebuilding of the largest vessel to fit them for special war purposes, such as conversion of the *Leviathan*, the biggest vessel afloat, for use as a transport, down to the installation of guns

18 in the following January, when the limited number of yards, in which capacity for this work had been allocated, were able to put additional ones in hand.

7. As will always be the case in a new and rapidly developing field, such as aeronautics, it was not possible before the war to have on hand or under production a large program of aircraft, which would have been obsolete when the emergency arose. But the bureau, in keeping its designs up to date, was fully prepared, with the result that in February, 1917, immediately after breaking diplomatic relations, orders were placed for 16 small patrol airships and in April for a large program of the most efficient training type of seaplanes. The same policy permitted later—October, 1917—of placing orders for a large program of patrol seaplanes. The bureau's investigations of manufacturing facilities led it in July to start the construction of a naval aircraft factory at Philadelphia, and this factory subsequently permitted the Navy to meet all of its obligations in connection with the production of seaplanes.

8. Based on reports from abroad, the bureau undertook, in the latter part of 1916, the development of a ship protective device against mines. On our entry into the war, the bureau at once took steps to obtain from the British Navy complete plans of the device, known as a paravane, which they had already fully developed. Manufacturing facilities were developed in private plants, and large orders were placed during the summer. These paravanes, as soon as delivered, were fitted not only to naval vessels but also to many vessels of our merchant marine.

9. Gas masks had never before this war been used on board ship, but developments abroad before our entry into the war indicated their desirability, and the bureau's prior investigations enabled it on May 7, 1917, to place the first large order for a device not previously produced in this country.

10. The bureau was engaged, both before and after our declaration of war, in many other activities, too numerous to mention in detail, but all of them of importance to the Navy's contribution to the energetic prosecution of the war—such as the arming of merchant vessels; the conversion of all types of mercantile and pleasure craft to war purposes; the preparation of the fleet of mine planters and carriers for the execution of the great northern barrage project; the establishment of a national salvage service; the experimental development and practical application of marine camouflage; the arrangements for training officers, enlisted, and civil personnel for carrying on the bureau's expanding activities; the planning of extensions of shore establishments for the repair and construction of vessels; the building up of huge reserves of material of every variety under the bureau's cognizance; and last, but by no means least, the evolving and negotiating new forms of contracts suitable for the exigencies of war, but at the same time insuring the protection of the financial interests of the country, in order that the necessary funds might be spent with the rapidity essential to great and accelerated production while guarding against fraud, waste, and extravagance.

D. W. TAYLOR.

GENERAL SUMMARY.

Three-year building program.—Six months before our entry into the war, Congress authorized the three-year building program, involving the construction of 156 vessels, and estimated to cost more than \$500,000,000. During this period contracts were placed for all vessels authorized to be begun at once. Just before and after our entry into the war, one of the bureau's largest undertakings was to plan for and make the necessary adjustments in this program for expediting work on some vessels, continuing on others and stopping entirely on still others (pp. 8 to 10).

Destroyers.—Designed 1916. Modified September, 1917. First war contracts for 24 in March, 1917; additional contracts placed in May, June, July, August, and October, 1917, and January and July, 1918. Total number in program, 275. First delivery, April, 1918. Total deliveries before the armistice, 38. Average time for construction, less than half of prewar figures. A new plant for construction was begun in October, 1917, and first boat was delivered from this plant in 13 months, and in approximately two years 30 boats were completed by the plant (pp. 11 to 21).

guarding against fraud. I append a comprehensive statement with a summary prepared by Admiral Taylor which, he said, the future historian will find essential when he comes to write the pages of the efficiency of naval vessels during the World War.

Mr. Chairman, I desire to just present all this statement in the record.

(The matter referred to is here printed in full in the record, as follows:)

NAVY DEPARTMENT.
BUREAU OF CONSTRUCTION AND REPAIR,
Washington, D. C., May 10, 1920.

From: The Bureau of Construction and Repair.

To: The Secretary of the Navy.

Subject: War activities of the Bureau of Construction and Repair.

Inclosures: As per attached list.

1. In submitting an account of its principal activities concerned with the World War, as given briefly in the accompanying inclosures, the bureau desires to call attention especially to the work accomplished or inaugurated before our entry into the war.

2. For more than a year before the rupture of diplomatic relations with Germany the Bureau of Construction and Repair had been working at high pressure and accomplished in that period what is believed to have been an unprecedented task for any technical organization by completing all of the necessary plans and specifications for the great three-year building program authorized on August 29, 1916. Although this program involved the preparation of nine complete new designs, of which those for the battleships, battle cruisers, scouts, and destroyers set entirely new standards for vessels of their class, the bureau's work was complete in all essential respects at the date of the passage of the bill, thereby permitting the placing of contracts immediately for 4 battleships, 4 battle cruisers, 4 scout cruisers, 20 destroyers, 27 submarines (two types), 1 gunboat, 1 hospital ship, 1 ammunition ship, and 1 fuel ship.

3. One special feature in connection with the designs of the capital ships of this program deserves special mention. During 1914, 1915, and 1916 there were carried on a long and elaborate series of experiments to develop the most efficient type of protection against underwater damage from mine or torpedo, which resulted in the incorporation in the designs of these ships of a type of construction which is believed to be more successful than anything yet evolved abroad and to render these ships safe from any form of underwater attack yet devised. The subsequent developments in the war have indicated that the time, money, and effort devoted to this subject have given our post-war Navy a unique position in this essential.

4. Before our entry into the war developments abroad indicated a greatly increased importance for the destroyer, and the bureau had accordingly been making a quiet survey of probable building capacity and tentative plans for a great expansion of existing facilities. The first active step in this direction was taken in March, immediately after the passage of the naval bill of March 3, 1917, making the necessary funds available, when orders were placed for 24 destroyers. From that date on additional orders were placed as rapidly as new building facilities could be arranged for; that is, for 6 in May, 6 in June, 29 in July, 26 in August, and 150 in October.

5. In its general survey of the situation the bureau had reached the conclusion that there was considerable military value in a comparatively small type of wooden-hull vessel which could be produced in boat and launch building yards, whose capacity would not be required for other items of a war program by any department of the Government. Immediately after the break in diplomatic relations, therefore, the bureau put in hand at once the preparation for the design of such a vessel, and orders were placed in March, 1917, before our entry into the war, for 355 of these vessels, which under the name of subchasers subsequently performed such sterling service both at home and abroad.

6. Even during the press of work on the three-year program in 1916 the bureau had foreseen the necessity in case of war of a sturdy form of fleet tender and seagoing mine sweeper, and had accordingly prepared a preliminary design for such a vessel. Immediately on our declaration of war this design was completed, and orders for 24 were placed in May, 1917, for 12 in July, and for

been obsolete when the emergency arose. I may say, Mr. Chairman, that I had a call this week from Mr. Caproni, who made the great airship which gave so much credit to the Italians, and he showed me plans and designs of other airships that the Italians are going to build, and they are going to use Liberty motors in all of them—the engine that we devised during the war. There is no engine like it in the world, and it was one of the great contributions to the war in which the Navy had some part. But the bureau, in keeping its designs up to date, was fully prepared, with the result that in February, 1917, immediately after breaking diplomatic relations, orders were placed for 16 small patrol airships, and in April for a large program of the most efficient training type of seaplanes. The same policy permitted later, October, 1917, of placing orders for a large program of patrol seaplanes. The bureau's investigations of manufacturing facilities led it in July to start the construction of naval aircraft factory at Philadelphia, and this factory subsequently permitted the Navy to meet all of its obligations in connection with the production of seaplanes.

No building has been built—or few buildings have been built—in the world of that magnitude in so short a time as the naval air factory in Philadelphia, and it did great work in the war.

Based on reports from abroad, the bureau undertook, in the latter part of 1916, the development of a ship-protective device against mines. On our entry into the war the bureau at once took steps to obtain from the British Navy complete plans of the device, known as a paravane, which they had already fully developed. Manufacturing facilities were developed in private plants and large orders were placed during the summer. These paravanes, as soon as delivered, were fitted not only to naval vessels but also to many vessels of our merchant marine.

Gas masks had never before this war been used on board ship, but developments abroad before our entry into the war indicated their desirability and the bureau's prior investigations enabled it on May 7, 1917, to place the first large order for a device not previously produced in this country.

The bureau was engaged, both before and after our declaration of war, in many other activities too numerous to mention in detail, but all of them of importance to the Navy's contribution to the energetic prosecution of the war, such as the arming of merchant vessels, the conversion of all types of mercantile and pleasure craft, to war purposes, the preparation of the fleet of mine planters and carriers for the execution of the great northern barrage project, the establishment of a national salvage service; the experimental development and practical application of marine camouflage; the arrangements for training officers, enlisted, and civil personnel for carrying on the bureau's expanding activities; the planning of extensions of shore establishments for the repair and construction of vessels, the building up of huge reserves of material of every variety under the bureau's cognizance; and last, but by no means least, the evolving and negotiating of new forms of contracts suitable for the exigencies of war, but at the same time insuring the protection of the financial interests of the country in order that the necessary funds might be spent with the rapidity essential to great and accelerated production while

class, the bureau's work was complete in all essential respects at the date of the passage of the bill, thereby permitting the placing of contracts immediately for 4 battleships, 4 battle cruisers, 4 scout cruisers, 20 destroyers, 27 submarines (two types), 1 gunboat, 1 hospital ship, 1 ammunition ship, and 1 fuel ship.

One special feature in connection with the designs of the capital ships of this program deserves special mention. During 1914, 1915, and 1916, there were carried on a long and elaborate series of experiments to develop the most efficient type of protection against underwater damage from mine or torpedo, which resulted in the incorporation in the designs of these ships of a type of construction which is believed to be more successful than anything yet evolved abroad and to render these ships safe from any form of underwater attack yet devised. The subsequent developments in the war have indicated that the time, money, and effort devoted to this subject have given our postwar Navy a unique position in this essential.

Before our entry into the war developments abroad indicated a greatly increased importance for the destroyer, and the bureau had accordingly been making a quiet survey of probable building capacity and tentative plans for a great expansion of existing facilities. The first active step in this direction was taken in March immediately after the passage of the naval bill of March 2, 1917, making the necessary funds available, when orders were placed for 24 destroyers. From that date on additional orders were placed as rapidly as new building facilities could be arranged for; that is, for 6 in May, 6 in June, 29 in July, 26 in August, and 150 in October.

In its general survey of the situation, the bureau had reached the conclusion that there was considerable military value in a comparatively small type of wooden-hull vessel, which could be produced in boat and launch building yards, whose capacity would not be required for other items of a war program by any department of the Government. Immediately after the break in diplomatic relations—and bear in mind before we declared war; this was in the early part of February, after the break in diplomatic relations—therefore the bureau put in hand at once the preparation of the design of such a vessel and orders were placed in March, 1917, before our entry into the war, for 355 of these vessels, which, under the name of subchasers, subsequently performed such sterling service both at home and abroad.

Even during the press of work on the three-year program in 1916 the bureau had foreseen the necessity in case of war of a sturdy form of fleet tender and seagoing mine sweeper and had accordingly prepared a preliminary design for such a vessel. Immediately on our declaration of war this design was completed and orders for 24 were placed in May, 1917, for 12 in July, and for 18 in the following January, when the limited number of yards in which capacity for this work had been allocated were able to put additional ones in hand.

As will always be the case in a new and rapidly-developing field, such as aeronautics, it was not possible before the war to have on hand or under production a large program of aircraft, which would have been obsolete when the emergency arose. I wish to emphasize that—that it was not possible before the war to have on hand or under production a large program of aircraft, which would have

with the limited number of effective vessels left in home waters—for we had sent all but a few of our destroyers to Europe—to sink the enemy submarines and end their depredations, has been previously set forth by Senator Lodge, a leading member of the Naval Affairs Committee, in a speech soon after the first submarines appeared, in June, when Senator Lodge said:

One or two submarines have appeared suddenly on our coast, as was to be anticipated. In my judgment, we are doing all that can be done. I have taken the pains to go to the department, where everything has been laid before the members of the Naval Affairs Committee who cared to investigate the subject, and I am entirely satisfied that they are doing everything that is possible. But the chase of the submarine is something like searching for the needle in the haystack. You can not tell in which particular wisp of hay it will come to the surface; but that the defense will be effective I have no sort of question.

* * * * *

We have a patrol along the coast which is composed chiefly of what is known as the Life-Saving Service, or the Coast Guard, as it is now known. We also have an organized system for procuring information from fishermen and others on the coast extending from Maine to the Gulf. These sources of information were organized and in operation through the Navy Department at least two years before we entered the war, so I believe that so far as our own coasts are concerned the chances of a base there are almost negligible.

* * * * *

I did not rise to go into the details to describe to you the different naval districts of the country and what has been done in each one of them, but simply to tell you what my own opinion is after having examined all the arrangements with the utmost care of which I was capable and with the most intense interest and give my word for what it is worth, that in my judgment the Navy and the Navy Department, the Secretary and Assistant Secretary, and all the officers, the Chief of Staff, and every head of bureau has done everything that human foresight could suggest.

WAR CONSTRUCTION PROGRAM EMBRACED 1,000 VESSELS—1,597 VESSELS CONVERTED FOR WAR PURPOSES.

The war construction program of the Navy, including the “three-year program” authorized in the naval appropriation bill of August 28, 1916, comprised approximately a thousand vessels, nearly three times as many as were in the Navy at the time war was declared. This was in addition to the 1,547 vessels which were converted for naval purposes.

This will convey some idea of the magnitude of the work done by the Bureau of Construction and Repair and the Navy Department under the direction and leadership of Admiral David W. Taylor, esteemed both in this country and abroad as a naval constructor without a superior in the world. The following is a brief summary of some of the outstanding war activities under the direction of Admiral Taylor:

For more than a year before the rupture of diplomatic relations with Germany the Bureau of Construction and Repair had been working at high pressure and accomplished in that period what is believed to have been an unprecedented task for any technical organization by completing all of the necessary plans and specifications for the great three-year building program authorized on August 29, 1916. Although this program involved the preparation of nine complete new designs, of which those for the battleships, battle cruisers, scouts, and destroyers set entirely new standards for vessels of their

enlarge old ones, and build new forging and engine plants, so that more destroyers could be produced. I kept in touch every day with the head of the Naval Affairs Committee of the House and of the Naval Affairs Committee of the Senate, and in cooperation with them we were moving with all possible expedition; and when they assured me that this bill was certain to pass, as I knew that I was justified in their representations, which proved to be true, as they always did during the war, Congress was asked for a large additional appropriation for this and the construction of destroyers. All the plans were prepared and the work under way before Congress finally acted. The bill appropriating \$350,000,000 was passed October 6, 1917; the contracts were signed immediately and all records broken in pushing the work. An example of this was the building at Squantum, Mass., of the largest plant in the world devoted exclusively to destroyers, which was begun in October, immediately after it was authorized by Congress, and in April, 1918, six months later, the keels of five destroyers were laid there in one day. Mr. Chairman, that construction, which proceeded in the worst weather ever seen, was a tribute to the genius of American initiative and ability to do any big thing called upon to do. I will have the pictures here to show you of that work, men working in the sleet and in the snow; Mr. ———, of the Bethlehem Steel Co., and his associates working with naval officers and civilian mechanics in such a snowstorm and in such cold as I did not think any men could work in. I want you to see those pictures.

We broke all records in destroyer construction. Before the war the shipyards required from 20 months to 2 years to complete a vessel of this type. We reduced this time more than half, and in individual cases this pace was exceeded. At Mare Island Navy Yard the destroyer *Ward* was launched in 17½ days after the keel was laid, a world's record never equaled. I will have here a book of photographs showing each day's progress on this vessel, which I would like for the committee to see. I assure you that if before this war anybody had told me it was possible I would not have believed it. We actually did the work every day.

THE CHAIRMAN. How many of these destroyers were used in the war?

Secretary DANIELS. I will take that up in my cross-examination. Senator McCumber's inquiries, which brought forth Senator Penrose's speech, indicated the extreme anxiety of the American people for the protection of our coast when German submarines were operating in American waters, sinking coastwise shipping and fishing craft. These criticisms had been answered, and the fact that the Navy Department was, and had been all along, using every effort possible with the limited number of effective vessels left in home waters—now, the charge has been made here that we kept too many ships in home waters and sent too few abroad in the early days of the war. Senator McCumber arises on the floor of the Senate and criticizes the Navy because we sent so many across that we did not have enough left here to protect us against submarines when they came over.

These criticisms had been answered, and the fact that the Navy Department was, and had been all along, using every effort possible

conclusions or decisions about the matters submitted to him. At least 150 days elapsed before even many of the preliminary contracts were awarded.

Some people in close touch with the department, assuming that the war has been costing this country and the Allies some \$100,000,000 a day, estimate that some \$15,000,000,000 or more have been expended merely to maintain a situation until the Navy Department could come to some conclusion, not to mention the losses in death and casualties on the different fronts.

therefor, in all probability postponed the end of the war at least four months.

[Penrose fixes it at three months. Admiral Sims says in all probability it was four months; so that they are very close together.]

The average loss of life per day to the Allies during the war was 3,000 men. This prolongation of the war, therefore, cost half a million lives.

Similarly, as the war cost the Allies \$100,000,000 a day, on the average, this prolongation resulted in the unnecessary expenditure of \$15,000,000,000, of which at least one-third was expended by the United States directly or loaned to the Allies.

The ouija board working across the Atlantic, or wireless communication, or telepathy, makes it exactly the same.

Did Penrose tell it to Sims or did Sims tell it to Penrose? Whose hand has been moving the ouija board around from the Sims letter back to Fiske and Fullam and all the way around to a reorganization of the Navy Department?

As for Senator Penrose's charges, the one which he and Admiral Sims both make in identical figures and almost identical words—that alleged delays cost three or four months time, the needless expenditure of \$15,000,000, and the loss of many lives—that charge has already been answered very fully, by the leading admirals of the Navy as well as myself.

His charge that "The Secretary of the Navy lost at least three months, and very likely much more, before he got started on his naval preparedness"; and that "at least 150 days elapsed before even many of the preliminary contracts were awarded," is answered fully and completely by the records of the Bureau of Construction and Repair, which I will present.

I beg you to listen to this, Mr. Chairman, as the most important statement, which fully refutes everything that Penrose and Sims have said, a statement of Admiral Taylor, in America and Europe regarded as second to no naval officer in the world. It shows that bids were invited for all destroyers and nearly all the other vessels in the "three-year program" appropriated for in the act of August 29, 1918, on the day that bill was passed; something that never happened before in the Navy; on the very day that the President signed the bill bids were awarded; that is the kind of procrastination that the Navy was guilty of; that when more money became available a number of additional destroyers were contracted for in March, 1917, just before the declaration of war; that is the kind of procrastination we employed; that within a few weeks after war was declared we had, either under construction or contracted for, every destroyer that American yards, with their then existing facilities, could build—that is, 117 of this type of vessel, more than twice as many as we previously had in the Navy.

But this was not enough, so in the summer of 1917 we worked out plans—now listen to this, Mr. Chairman—to build new shipyards,

don October 11 expressed precisely the same idea? He said, as quoted in the London Times of October 12, 1918:

Another idea was sometimes in the American mind, that the American Navy had been doing the bulk of the business over here—at least a half. That was not correct. There were about 5,000 antisubmarine craft operating day and night, and the American craft numbered 160, or 3 per cent. The figures were about the same in the Mediterranean. Again, Americans seemed to regard it as a miracle of their Navy that they had gotten a million and a half troops here in a few months and had protected them on the way. "We didn't do that," said Admiral Sims. "Great Britain did." [Cheers.]

Cheers by a British audience. The statement was not true.

She brought over two-thirds of them and escorted a half.

I do not know whether there were cheers about that, but the statement was not true.

Admiral Sims said:

We escort only one-third of the merchant vessels that come here.

And I suppose there were cheers again; but the statement was not true, as I have shown repeatedly in this testimony.

It is also worthy to note that it was at this very time that Penrose was making his speech Sims was writing to Capt. Pratt, threatening an investigation of the conduct of the war. Capt. Harris Laning's letter to Admiral Sims was written August 26, 1918, just two days after Senator Penrose made his speech. In that reply he quotes the following from the letter of Admiral Sims to Capt. Pratt, received a few days previous. Here is what Admiral Sims wrote to Capt. Pratt. [Reading:]

When the history of this war comes to be written there will be a number of features that will not be very creditable to the United States Navy. If hearings are held on the conduct of the war—

Evidently then, in his mind, having in view preferring the very charges he is preferring now; in August, 1918—

If hearings are held on the conduct of the war a number of rather disagreeable facts must inevitably be brought out.

That is the end of Admiral Sims's statement to Capt. Pratt.

The great minds, even those of politicians and admirals, and some who are both, run in the same channels is strikingly exemplified by the similarity of the allegations of Sims and Penrose. I present them in parallel columns, Mr. Chairman, because that will give you the similarity better than otherwise. [Reading:]

PENROSE.

It is easily demonstrated that the Secretary of the Navy lost at least three months, and very likely much more time, before he got started on his naval preparedness. This fleet of destroyers, which ought to have been gotten ready long before they were, are now being built, and very few of them have been turned out.

In my opinion, this is due very largely to the procrastination of the Secretary of the Navy, who for some reason or other was unable to reach

SIMS.

It can thus be said that the failure of the Navy Department to enter the war immediately and wholeheartedly cost the allied cause as a whole two and one-half million tons of shipping sunk unnecessarily. * * * The loss of this amount of shipping can also be translated into a definite prolongation of the war and unnecessary sacrifice of blood and treasure in accomplishing the victory. * * *

The loss unnecessarily of the two and a half million tons of shipping,

Either Admiral Sims is a plagiarist and appropriated his views and charges from Senator Penrose, or by the new science of mental telepathy the views of the Senator from Pennsylvania were communicated to Admiral Sims by wave lengths or some other wireless method unknown to those not familiar with occult science. Penrose comes from Pennsylvania, and Sims was appointed to the Naval Academy from Pennsylvania. Did they collaborate or exchange mental telegrams?

This mental telepathy not only went from Senator Penrose's active brain to the dome of Admiral Sims, imparting figures, but his ouija board communicated the same character of ideas and exact words to some other witnesses who have been heard by your committee. Several officers who were so obsessed by their own superior wisdom that they thought the Secretary of the Navy ought to "sign here" whenever they presented a plan they had written out have told you that I was guilty of "procrastination." Where did they get that idea and that particular word? See the speech above quoted of Senator Penrose.

You gentlemen of the committee must have been surprised at the parrotlike repetition of the word "procrastination" used by several witnesses. I confess it surprised me, for not one of them ever intimated to me that they associated that word with me. It must be plain to you now. The circuit of mental telepathy from the brain or the ouija board of the Senator from Pennsylvania is communicated by some ether waves to certain of your witnesses, and "procrastination" is repeated by the subjects of the medium. I do not know enough about spiritualism to know whether the persons acted upon know how the words are communicated to them or whether it is a sort of seventh sense. But one thing is clear now that was inexplicable before Senator Penrose's speech was exhumed from the Congressional Record, they all speak the Senator's language—figures, phrases, and all. Indeed, gentlemen of the committee, all these charges are contained in Senator Penrose's speech of August, 1918, and you might have saved thousands of reams of paper by investigating his brief accusation which his plagiarist or hypnotized successors have elaborated into many hundred thousand words.

Inasmuch as these serious and grave charges made by Senator Penrose, which I never heard of, so far as I can recall, until two or three years ago, have been buried so long in the Congressional Record, are a matter of record, and were preferred by a leading Senator during the campaign for the election of Members of Congress in 1918, I can not let them pass without giving the Senator and the committee some information which he did not possess when he made that speech. He was imposed upon by some informant who is almost as reckless in his figures as Admiral Sims was in his accusations. When the Senator has the facts he will, of course, be glad to correct his statements made upon information he will now see was not reliable.

The telepathic wireless must have been working clear across the ocean, for Sims was telling practically the same thing to Americans who were in Europe. Is it not rather a remarkable coincidence that Admiral Sims in his speech to the American newspaper men in Lon-

Congressional Record, volume 56, part 9, Sixty-fifth Congress, second session, page 10453, and is also printed again separately in the Congressional Record of August 27, 1918, under the head of "Operations of the Navy," as "Speech of Hon. Boies Penrose, of Pennsylvania, in the Senate of the United States, Saturday, August 24 (legislative day of Thursday, August 22), 1918." Senator Penrose was answering a question of Senator McCumber as to why the trawler, armed by a German U-boat, which, he said, "for more than a week has been destroying fleet after fleet of our fishing smacks," had not been captured. Here is the charge made by Senator Penrose, as set forth in the Congressional Record:

MR. PENROSE. Mr. President, I think, as a minority member of the Naval Committee, I can in part answer the Senator's inquiry. It is easily demonstrated that the Secretary of the Navy lost at least three months, and very likely much more time, before he got started on his naval preparedness. This fleet of destroyers, which ought to have been gotten ready long before they were, are now being built, and very few of them have been turned out.

In my opinion, this is due very largely to the procrastination of the Secretary of the Navy, who, for some reason or other, was unable to reach conclusions or decisions about the matters submitted to him. At least 150 days elapsed before even many of the preliminary contracts were awarded.

Some people in close touch with the department, assuming that the war has been costing this country and the Allies \$100,000,000 a day, estimate that some \$15,000,000,000 or more have been expended merely to maintain a situation until the Navy Department could come to some conclusion, not to mention the losses in deaths and casualties on the different fronts.

MR. CHAMBERLAIN. May I interrupt the Senator?

MR. PENROSE. Yes, sir.

MR. CHAMBERLAIN. Does not the Senator think it would be entirely proper to call attention to the fact that the Navy of the United States has done magnificent work in conveying the ships that bore over a million and a half of our young men to Europe, and conveyed the ships that have taken cargoes over and conveyed them on the return voyage? I do not know much about the Navy, I am frank to say, but I know the Navy has done most excellent work.

MR. McCUMBER. Will the Senator allow me to ask: Have we not one little warship on the Atlantic coast that can do battle with this trawler?

MR. CHAMBERLAIN. The Senator puts that question to me?

MR. McCUMBER. Yes.

MR. CHAMBERLAIN. It may be that when the German submarine commenced its operations here we might not have had any ships along this coast, because it is straining the resources of the Government to take our troops safely to Europe.

MR. McCUMBER. I can take the Senator down the coast and show him a dozen warships on our coast.

MR. CHAMBERLAIN. I am not particularly well advised about the Navy. It does not come under our jurisdiction; and the good Lord knows it takes all one's time to try to help out the military situation, but I think they ought to be given credit for the splendid work they have done in getting our men across without the loss of a single troopship.

MR. McCUMBER. What has that to do in the matter of allowing a trawler here that has been captured and can not go over 10 to 12 knots per hour to destroy our fishing fleets all along the Atlantic coast?

MR. PENROSE. Mr. President, while I am on my feet, since the chairman of the committee has raised the point, my information is that the troops have been carried largely in British vessels.

MR. CHAMBERLAIN. I am speaking only of convoys.

MR. PENROSE. The convoys have been largely, though not entirely, British vessels.

I saw in the paper the other day—I do not know in any way how accurate it is—that the American vessels in the Atlantic waters are a very small percentage of the total allied fleet.

That ends what appeared in the Congressional Record.

NAVAL INVESTIGATION.

TUESDAY, MAY 18, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, in room 235 Senate Office Building, at 10 o'clock a. m., Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, Keyes, and Trammell.

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Mr. Chairman, when Admiral Sims first appeared before your committee in the medal awards hearings he was asked what had brought about the investigation, and he answered that he did "not know anything about these things," but had "just sized it up that there was some political flavor about it." This appears on page 361 of the medal awards hearings, as follows:

Senator PITTMAN. I am sorry, as I was in hopes that we could dispose of this whole matter in the Senate by referring this whole investigation to the board. I would like to see it all go there.

Admiral SIMS. It is there now.

Senator PITTMAN. They are investigating now, are they not, there?

Admiral SIMS. Search me. I do not know. [Laughter.]

Senator PITTMAN. I do not myself.

Admiral SIMS. I do not myself.

Senator PITTMAN. I want to state that I protested against this useless investigation.

Admiral SIMS. Of course, being a military man, I do not know anything about these things. I just sized it up that there was some political flavor about it.

When Admiral Sims appeared before your committee and made the grave charge that the Navy Department's delay had cost \$15,000,000,000, lengthened the war months, and other wild and preposterous statements, I thought he was voicing his own vivid imagination and that these figures were original with him. Since I gave an exhaustive and complete answer to this charge, which every responsible admiral in the Navy has sworn was without foundation, I have been informed that it was not Admiral Sims who originated this charge, but that it was first made in the Senate on August 24, 1918, by Senator Penrose, of Pennsylvania. It attracted no attention whatever then, and I do not recall seeing any reference to it in the press. Certainly if my attention had been called to it, the answer would have been as easy then as now. The original charges, amplified, and repeated by Admiral Sims in his testimony before your committee, are contained in Senator Penrose's speech, and will be found in the

The records of valor of sailors and marines stirred the blood during the World War and have given to the world admiration for the men of the American Navy, who showed by the courage thus displayed that it is a reflection upon the Navy to minimize its service because the high sea fleet of the enemy dared not try conclusions with the capital ships of the allied forces, because American participation gave such preponderating strength to the allied fleet that the Germans dared not repeat the Jutland Battle. That is all that I have brought up this afternoon, Mr. Chairman.

The CHAIRMAN. Very well; the committee will stand adjourned until 10 o'clock to-morrow morning.

(Thereupon, at 4 o'clock p. m., the subcommittee adjourned until to-morrow, Tuesday, May 18, 1920, at 10 o'clock a. m.)

The ship was making only 12 knots at the time, owing to damaged propeller, and the submarine no doubt misjudged her speed, which ordinarily would have been at least 16 knots. About this time a submarine was sighted and reported by a patrol in this vicinity.

UNITED STATES FORCES OPERATING FROM GIBRALTAR.

A number of engagements with enemy submarines by United States naval vessels based on Gibraltar were reported, including the following:

At 5.33 p. m., while on Mediterranean convoy duty on May 8, 1918, in latitude 38° 06' N., longitude 3° 3' E., the *Lydonia* sighted the wake of a torpedo, which later torpedoed the British steamship *Ingleside*. H. M. S. *Basilisk* and *Lydonia* dropped a barrage of depth charges. The British Admiralty have credited the sinking of this submarine to the *Basilisk* and *Lydonia*.

On May 15, 1918, the *Wheeling*, *Surveyor*, and *Venita*, while escorting a Mediterranean convoy, sighted the track of a torpedo, which torpedoed a merchant ship of the convoy in latitude 36° 03' N., longitude 1° 47' W. The wake of the submarine could be seen. A depth charge attack was made. The British Admiralty credited the sinking of this submarine to these three escort ships, the squadron commander reported.

On September 5, 1918, at 1.04 a. m., the *Chester*, while on ocean escort, sighted a submarine close aboard on starboard bow. After attempting to ram submarine, attacked her with depth charges. Up to the present time no results of this attack have been brought to light. The commanding officer of the *Chester* is of the opinion that the last depth charge may have damaged the submarine.

On September 9, 1918, at 7 p. m., convoy GGA-54 was attacked by enemy submarine in latitude 38° 11' N., longitude 4° 58' E. British steamship *Arabis* torpedoed and sunk. *Paducah* attacked with depth charges, and is reported to have damaged submarine.

U. S. submarine *AL-2* (Lieut. P. F. Foster, commanding): Returning from patrol July 10, 1918, U. S. submarine *AL-2* sighted a suspicious object and changed course to investigate. Ten minutes later a terrific explosion occurred under starboard quarter of *AL-2*, putting out lights, throwing off their feet men in engine room, and doing minor damage to various auxiliaries. When splash from explosion (presumably that of a torpedo) subsided the periscope of a submarine was seen in the slick. Enemy was observed heading across stern of the *AL-2*, evidently injured and attempting to get to the surface. The *AL-2* put its rudder over and maneuvered to ram. As it was seen that the only chance to get the U-boat was to ram it submerged, *AL-2* executed a crash drive. The U-boat, apparently deciding that its only chance to avoid ramming was to pass under the *AL-2*, descended. *AL-2* passed immediately over the U-boat, missing it by only a few feet. The crash dive carried *AL-2* to a depth of 100 feet, but fortunately the explosion had not seriously damaged her hull. By her listening devices *AL-2* could hear the propellers of the U-boat, which were running at highest speed, indicating that it was again attempting to reach the surface. *AL-2* swung around and started after U-boat, maintaining position directly astern of the enemy. At this time the propellers of another U-boat, running at slow speed and in a different direction, were heard. A few minutes later the U-boat the *AL-2* was pursuing stopped and was heard no more. It had not reached the surface. Shortly after the other U-boat began calling its mate insistently on its underwater signaling apparatus, but received no answer. *AL-2* remained in the vicinity to make certain the boat it was pursuing did not escape and then changed its course and headed for the second U-boat, but was unable to overtake it. After a short pursuit *AL-2* returned to position where first U-boat had stopped, searched the surface by periscope, and maintained careful listening patrol for several hours, until 11 p. m. As there was no trace of U-boat, *AL-2* returned to port.

The British chart showed that the *UB-65*, which was charged as operating in that locality, was missing, and, though the U-boat was damaged by its own torpedo, the crash dive and maneuvers of the American submarine, preventing the enemy from getting to the surface, were regarded as so largely responsible for its destruction that the British Admiralty credited the *AL-2* with the sinking, with the indorsement: "U. S. submarine *AL-2*, Lieut. P. F. Foster, July 10, 1918: Known sunk, *UB-65*" (Admiralty class).

She quickly submerged; the *Reid* estimated her probable location and dropped a depth bomb. A large oil slick appeared and two more charges were dropped. The *Isabel*, which was near by, also dropped a depth charge. As an oil slick 300 yards long by 50 yards broad appeared, it was concluded the submarine was either sunk or seriously damaged.

United States destroyer *Stewart* (Lieut. H. S. Halship) had an encounter with enemy submarine April 23, 1918, which the British Admiralty pronounced a successful engagement, with the indorsement that the submarine was "probably seriously damaged."

The *Christabel* (Lieut. Commander M. B. McCord) on May 21, while escorting a northbound convoy, saw a wake about 300 yards distant and steamed across it, dropping depth charges. Three hours later a submarine was seen near the convoy. The *Christabel* steamed toward the place where the U-boat submerged, and dropped two depth charges. The first brought up only clear water, but the second, when exploding, caused a secondary explosion, presumably a torpedo or mine in the submarine; and heavy oil, bubbles, and bits of wood came to the surface. The submarine, the *UC-58*, was, it was learned afterwards, badly damaged, but managed to reach Santander, Spain, where it was interned.

UNITED STATES BATTLESHIPS SERVING WITH BRITISH GRAND FLEET.

Secretary DANIELS. A report compiled and issued by Admiral Sims's headquarters in London stated that "between the dates of their arrival in European waters and signing of the armistice, United States battleships were attacked six times by enemy submarines, and on one occasion the *New York* collided with a submarine." That report gives the following brief summary of these encounters:

Florida, Delaware, February 8, 1918: While maneuvering off the Norwegian coast (exact position not stated) awaiting a return convoy, a submarine was sighted; four torpedoes were fired at the *Florida* and two at the *Delaware*. Both ships successfully maneuvered to avoid being hit. Two depth charges were dropped by destroyers.

Texas, April 27, 1918: At 12.47 p. m., in 56.56 N., 0.40 W., *Texas* sighted a periscope and opened fire. Depth charges were dropped by two destroyers, neither of which saw the submarines. No sign of damage.

New York, Delaware, Florida, Wyoming, Texas, June 30, 1918: First attack—At 1619, division in line abreast in open order, periscope was reported by the *Wyoming*, and was also seen by the *Parker* (destroyer); *Delaware, Florida*, and *Wyoming* opened fire; destroyers dropped six depth charges, as follows: *Salmon*, 1; *Parker*, 3; *Radstock* 2; *Radstock* remained in vicinity for half an hour, but saw nothing further. Second attack—At 1726 in latitude 58.44 N., longitude 2.34 E., *Delaware* opened fire on submarine reported astern; destroyers did not see periscope; 10 depth charges were dropped as follows: *Salmon*, 4; *Parker*, 2; *Sable*, 3; *Rocket*, 1.

Arkansas, July 28, 1918: At about 9 p. m., latitude 57.55 N., longitude 0.05, sighted periscope and opened fire with port sky gun, meanwhile going to "emergency full speed ahead" and using rudder to bring object fired at ahead. A torpedo wake was sighted running toward the ship, which she avoided by swinging to the left.

At 5.42 p. m., while the *New York* was leading the divisions, into Pentland Firth, her position then being Lother Rock Beacon 17°, Muckle Skerry Light 122°, Strome Light 257°, Swona Light 302°, and while turning with right rudder (hence stern swinging to port), a heavy underwater blow was felt on her starboard quarter, followed immediately by another, which damaged the ship's starboard propeller, breaking off two blades. After weighing all evidence in the case, such as position, depth of water, appearance of *New York's* hull when she was docked after the collision, etc., the division commander reached the conclusion that she had struck a submarine, which belief was verified by the report of the board of inquiry.

New York, October 16, 1918: At 1 a. m., while en route from a northern base, at Rosyth, three torpedoes were fired at the *New York*, all passing ahead of her

Cassin, Commander W. N. Vernon. While patrolling off the south coast of Ireland, October 15, 1917, the *Cassin* sighted a submarine awash about 5 miles distant, and speeded to attack, but the U-boat immediately submerged. While continuing the hunt in the vicinity a torpedo was sighted, headed for the ship, moving at high speed only 300 or 400 yards away. Full speed was signaled and the rudder put hard to left.

Had it kept on its course the torpedo would probably have passed astern, but when only 15 or 20 feet from the ship it porpoised, leaving the water and sheering to the left, hit the ship aft on the port side, exploding instantly, killing Osmond K. Ingram, gunner's mate, who had dashed to the stern to throw overboard the depth charges placed there. Ingram sacrificed his life in this effort to save the ship. The explosion of the torpedo and several depth charges blew off 36 feet of her stern. Her rudder having been carried away the ship could not be steered. Half an hour after she was torpedoed, the submarine's conning tower came to the surface about 1,500 yards distant. The men were still standing at the guns, and, though the *Cassin* was turning in circles, No. 2 gun opened fire and drove off the submarine. Two hours later, at 4.25 p. m., the wreckage which was hanging to the stern dropped off, and at dark the *Cassin* stopped her port engine and drifted. At 9 p. m. the British vessels *Jessamine* and *Tamarisk* came to her assistance, and worked most of the night trying to tow the *Cassin*. Early the next morning British trawlers and a tug got lines to her, and she was later towed to port by H. M. S. *Snowdrop*, arriving at 7.05 p. m.

UNITED STATES FORCES OPERATING IN FRENCH WATERS.

Numerous encounters with submarines were reported by the United States naval forces operating in French waters. When the first patrol squadron of armed yachts was on its way to France, the *Noma* and *Kanauchah* on July 2, 1917, sighted a periscope some distance away, but the U-boat disappeared before it could be successfully attacked. The same day the *Sultana* picked up the survivors of the steamship *Orleans*, which had been torpedoed. On July 19, 1917, an enemy submarine fired a torpedo at the *Noma*. The *Noma*, though one of her boilers was out of commission, went to the relief of the British Q. ship *Dunraven*, which was shelled and torpeded, and attacked the submarine, attempting to ram the enemy, but the U-boat submerged and escaped. The *Noma* then acted as escort to the British ship *Christopher*, which took the *Dunraven* in tow.

The *Noma* had a gunfire engagement with a large-type submarine on August 15, 1917, firing 10 shots, while the U-boat fired 3 at the ship. The U-boat was 6,000 yards distant when sighted, and submerged and escaped before the *Noma* could reach her. The *Noma* (Lieut. Commander L. R. Leahy), *Wakiva* (Lieut. Commander G. E. Davis), and the *Piqua* (ex-*Kanaucha II*) (Lieut. Commander H. D. Cooke), were credited by the British Admiralty for a successful attack on a submarine November 28, 1917. While the admiralty indorsement was "probably seriously damaged," the evidence of oil and wreckage indicated that the U-boat was sunk.

Remlik on December 17, 1917, in the midst of a heavy gale, sighted the periscope of a submarine abeam, 300 yards away. Though heavy seas were breaking over the *Remlik*, sweeping over both guns, the crew made every effort to attack the enemy, even the commanding officer himself manning a gun. When the seas prevented the guns being trained on the U-boat, the little yacht, in spite of the seas that almost swamped her, attempted to ram the submarine. Depth charges could not be used, since the *Remlik* could only make 2 knots against the gale. Seas came over both guns which bore on the submarine and washed overboard a depth-bomb box. The huge depth charge was rolling around the deck when the safety pin fell out. The danger was instantly realized. If the bomb exploded the vessel would almost certainly be sunk. Any man who ventured to that part of the vessel risked being swept overboard, and if the bomb exploded it meant certain destruction. But John Mackenzie, chief boatswain's mate, ran down the deck and made a dash for the bomb. It was too huge to lift, and as he wrestled to get it on end he was thrown down time and again. At last he got it in place, lines were thrown to him, the dangerous bomb lashed down, and the ship was saved.

United States destroyer *Reid* on March 18, 1918, sighted a submarine about 4 miles distant, her broadside silhouette with two radio masts being seen.

and minor fittings on small vessels. Altogether 1,597 vessels were converted for naval purposes under the direction of the bureau (pp. 133 to 135).

Arming of merchant vessels.—This work likewise was started before our entry into the war, the first vessels outfitted with a battery, magazines, quarters for guns' crew, and fire-control appliances being the *Manchuria* and *St. Louis*, of the American Line, during the first week in March, 1917. A total of about 370 merchant ships were handled in this manner (pp. 136 to 137).

Preparation of mine planting fleet.—The bureau's part in the great northern barrage was the conversion of naval and merchant vessels for planting and carrying the new type M mine. This work was undertaken toward the end of 1917, when it had been definitely decided to proceed with the project, and was completed in about three months. Ten large vessels were fitted to plant 5,700 mines in a single operation and 22 small Lake class vessels were fitted to transport the mines from the United States to the mining bases in Scotland (pp. 138 to 139).

Converted mine sweepers.—Before our entry into the war most American merchant vessels, yachts, tugs, and trawlers had been inspected by the Navy and notation made of the variety of war service for which they were suited. Immediately after our entry into the war many vessels suitable for mine sweeping were acquired by purchase, charter, or loan, and the working of fitting them as sweepers was at once proceeded with. In all, 87 such vessels were fitted out, of which number 14 were sent abroad (pp. 140 to 149).

Naval salvage service.—A few months after our entry into the war it became evident that as practically all shipping was under Government control the Government should likewise take control of all available salvage facilities. In January, 1918, the bureau commandeered the entire equipment of the three principal Atlantic coast salvage companies, and most of their personnel was enrolled in the Naval Reserve Force. The entire organization and its equipment was rapidly expanded. In addition to five existing salvage steamers, five other suitable vessels were fully equipped for this service, of which number three were stationed on the coast of France (pp. 150 to 173).

Marine camouflage.—Before the war the bureau had experimented with various systems of painting for ships with a view to reduction of visibility. As a consequence of this preparatory work four or five systems were utilized during the early months of the war. In January, 1918, arrangements were completed with the United States Shipping Board whereby the bureau took charge of all development and experimental work in this field for all vessels of the American merchant marine, as well as for ships belonging to the Army and Navy. An organization, consisting of design and research sections and a field inspection force, was built up. From March 1, 1918, to the armistice, 1,256 vessels were camouflaged—painted under the supervision of the bureau (pp. 174 to 186).

Paravanes.—Before our entry into the war the bureau undertook the independent development of a device known to be in use by the Allies for protecting vessels from mines, but of which no details were available. Immediately after our declaration of war plans of this device, the paravane, were obtained from England, and the bureau at once took up the problem of their production in quantity and the even more difficult problems of fitting ships to carry them and training personnel in their use. This work covered the merchant marine as well as the Navy. A total of 1,996 paravanes were produced (pp. 187 to 200).

Navy gas masks.—Prior to our entry into the war the bureau had carried on investigations of gas masks for use on board ship. No standard type had, however, been adopted, due to lack of dependable information of actual war experience in their use. When this information became available after April 6, 1917, the bureau pushed the work intensively and orders were placed on May 7, 1917, for 50,000 masks of its own design. A total of 170,000 masks were completed and available for use by the armistice (pp. 201 to 207).

Bureau organization.—Number of officers and employes in 1916, 143; in November, 1918, 687. Approximate average expenditures per annum under the bureau, fiscal years 1912-16: Appropriation "Construction and repair," \$9,000,000; appropriation "Increase of the Navy," \$9,000,000; total, \$18,000,000. Approximate average per annum, 1918-19: "Construction and repair," \$71,000,000; "Increase of the Navy," \$222,000,000; miscellaneous appropriations, \$34,000,000; total, \$327,000,000. Number in bureau organization per million of expenditure, 1912-16, 8; 1918-19, 2 (pp. 208 to 211).

THE THREE-YEAR NAVAL BUILDING PROGRAM.

The World War started in Europe in August, 1914. Before a year had passed the President had announced the necessity for a policy of naval expansion. In pursuance of this policy, the Secretary of the Navy, in July, 1915, called upon the General Board to submit recommendations "As to what the Navy must be in future in order to stand upon an equality with the most efficient" and to submit "a program * * * formulated in the most definite terms * * * planned for a consistent and progressive development of this great defensive arm of the Nation." The General Board accordingly submitted their first report on July 30. After consideration of this program and the estimates of cost for carrying it out, the Secretary, on October 7, directed the General Board to prepare "A building program for the Navy that will continue over five years with an expenditure of about \$100,000,000 each year for five years on new construction only." The General Board's program was submitted on October 12. The Secretary, in his annual report of December 1, submitted the General Board's program and recommended its authorization practically without change, except in regard to the distribution of numbers of vessels over the five-year period and some increases in numbers of submarines.

After extended hearings by the House Naval Committee, the entire program was included in the naval bill for the fiscal year 1916. When this bill reached the Senate the Naval Affairs Committee of that body recommended, with the concurrence of the Secretary, that the entire program be laid down within three years instead of within five years, as originally proposed. It was in this form that the bill was finally passed by both Houses of Congress and received the approval of the President on August 29, 1916.

During the consideration of this measure by Congress the technical bureaus of the Navy Department had proceeded as rapidly as possible with the design of all types of ships which it was proposed to lay down in the first year. In order that the work might be placed in hand at once upon its authorization, the department submitted to Congress in December, 1915, a request for the inclusion in the urgent deficiency bill of an authorization for the employment of additional draftsmen and other technical employees, as the design work involved in the preparation of complete new designs for 10 different types of war vessels, 2 of which had never previously been designed or built in the United States, involved an unprecedented volume of work.

The success of these measures is shown by the fact that on August 29, the day of the approval of the act, instructions, together with plans and specifications, were issued to three navy yards for the construction of one fuel ship, one hospital ship, and one gunboat.

On the same day bids were invited and plans and specifications were issued for 4 battleships, 4 scout cruisers, 20 destroyers, and 27 submarines.

Bids on the battleships and destroyers were opened on October 25; on the scout cruisers and submarines on November 1. Orders for the construction of all of these vessels were placed forthwith. Bids were invited and plans and specifications were issued for the battle cruisers about October 1, and bids were opened on December 6. Orders were issued, together with plans and specifications, to a navy yard on January 5, 1917, for the construction of the ammunition ship. It will thus be seen that, except for the necessity of 60 days' advertisement and the time required for the negotiation of contracts after the opening of bids from private builders, the department was prepared on the day the bill passed to proceed with eight of the types of vessels authorized, viz, battleships, scout cruisers, destroyers, two classes of submarine, fuel ship, hospital ship, and gunboat, and within 30 days was prepared to proceed with the battle cruisers.

Such speed was without precedent in the history of the Navy Department. It was the result of persistent insistency by the Secretary of the Navy that work should be pushed, and his loyal support in this respect by the bureau concerned. There was no procrastination or dilatoriness in the largest undertaking ever entered into by the United States Navy, and the most important from the point of view of preparation for any eventuality. While the large vessels of the program had to be suspended during the war, the destroyers were pressed, and were able to enter the war months earlier than would have been the case if in 1916 the leisurely methods formerly in use when placing contracts had been followed.

DESTROYERS.

At the commencement of the war, in April, 1917, there were 50 destroyers available, all of which had been completed within 10 years. These were in addition to 16 small destroyers authorized during the Spanish War, which had come to be classed as coast torpedo vessels, and 17 of the early torpedo boats.

Practically all of the 33 small boats had been out of commission, but were placed in service and used throughout the war, some of them in European waters.

The original 16 destroyers were of about 400 tons displacement and slightly less than 30 knots speed, carrying two 3-inch guns, four 6-pounders, and two 18-inch tubes. No further authorization of destroyers was made until 1906, and, during the following 10 years a total of 58 had been provided at intervals, these being numbered 17 to 74. Of the 50 that were ready for service in April, 1917, about half were of the 700-ton type, authorized from 1906 to 1911, mounting four 3-inch guns and three 18-inch twin tubes. Their sea-going qualities and endurance represented a great advance compared with the earliest type.

In 1911 it was decided to make a further increase in offensive qualities and radius, resulting in a 1,000-ton type, with four 4-inch guns and four 18-inch twin tubes, the torpedoes being changed to 21-inch after 1913.

A further development was made in 1915, with a view to increased longitudinal strength, better arrangement of battery, etc. All vessels built before that time were arranged with a forecastle deck extending aft for about one-third of their length, for the purpose of obtaining high freeboard forward, in order to keep the vessels as dry as possible when operating at high speeds in any weather. The development referred to eliminated this high forecastle and the upper deck was made continuous, keeping approximately the same freeboard at the bow and at the stern as in the previous vessels, the sheer line of the deck being carried directly from bow to stern without the break at the after end of the forecastle, which had previously been customary in our design. While none of this new "flush-deck" type were completed prior to our entrance into the war, five were delivered during the early stages, and saw immediate active service in the war zone. There were six vessels of this type authorized, numbered 69 to 74, inclusive. They were slightly longer and slightly heavier than the previous class, being 310 feet long and displacing normally a little over 1,100 tons.

All of the types described above, up to destroyer No. 74, were designed for 30 knots speed, and beginning with those authorized in 1908, for the use of oil fuel instead of coal.

As the war in Europe progressed conditions called for a material increase in the size of the Navy of the United States. The act of Congress approved August 29, 1916, provided a three-year building program, including 50 destroyers, for 20 of which a specific appropriation was then made. These 20 vessels contracted for in the fall of 1916, while of the same general type as those immediately preceding, embodied a number of minor improvements, with a marked increase in speed to 35 knots, in view of the designed speed of cruisers and scouts with which they might be called upon to operate.

This was accomplished on about the same length and with a normal displacement of less than 1,200 tons. Contracts for destroyers Nos. 75 to 94, inclusive, were placed as follows: Four at Bath Iron Works, Bath, Me.; eight at Fore River Shipbuilding Co., Quincy, Mass.; six at Union Iron Works, San Francisco, and two at navy yard, Mare Island.

It was evident that if we became involved in the war, special efforts would have to be made to provide convoys for the transports carrying troops across the Atlantic and to combat Germany's energetic and dangerous submarine campaign, which was then assuming alarming proportions. The act of Congress approved March 4, 1917, specifically appropriated funds to build 15 more of the 50 vessels provided for in the three-year program, and in addition placed at the disposal of the President, to be expended at his direction and in his discretion, an emergency fund of \$115,000,000 for the "purchase or construction of additional destroyers," and other purposes indicated. Destroyers Nos. 75 to 94, inclusive, had already been contracted for, as referred to above, and contracts were placed immediately for the additional 15 vessels of the three-year building program, Nos. 95 to 109, inclusive. Under the provisions of the naval emergency fund, further orders were placed for 76 destroyers, Nos. 110 to 185, inclusive.

Thus 91 additional vessels beyond the 20 contracted for in 1916 were distributed among the shipbuilding yards of the country before the middle of August, 1917, as follows: 18, Fore River Shipbuilding Co.; 20, Union Iron Works; 21, William Cramp & Sons Ships & Engine Building Co., Philadelphia; 11, Newport News Shipbuilding Co., Newport News, Va.; 10, New York Shipbuilding Co., Camden, N. J.; 4, Bath Iron Works; 1, Navy Yard, Charleston; 6, Navy Yard, Mare Island.

As already indicated in the body of the narrative, it was decided to duplicate the design of the first twenty 35-knot vessels contracted for, although none had even been launched. When the demand for still more destroyers was met by an appropriation of \$350,000,000 toward their construction in the act of October 6, 1917, which included authority for the President to "acquire or provide facilities additional to those now in existence for the construction of torpedo-boat destroyers, their hulls, machinery, and appurtenances, including the immediate taking over for the United States of possession of and title to land, its appurtenances and improvements, which he may find necessary in this connection," the same policy was followed, except for some further development indicated below.

Under the act of October 6, 1917, 150 vessels, *Nos. 186 to 335*, inclusive, were contracted for, and there were provided material increases in all existing yards, as well as separate extensions under the supervision and control of these yards. These vessels were placed as follows: 20 at Newport News; 25 at Cramps; 20 at the New York Shipbuilding Co.; 85 with the Bethlehem Shipbuilding Corporation, of which 10 were to be built at Fore River, 35 at Squantum, and 40 at its Union plant, San Francisco.

The most notable of the plant extensions were the taking over of plants formerly used for other purposes in the vicinity of the Union Iron Works, San Francisco, Calif., which were modified and enlarged as necessary to provide for additional destroyer construction; and the building of a complete new plant, with the exception of machine and boiler shops, on a large tract of land at Squantum, Mass., near Boston. The latter extension required the filling and grading of swampy ground and the building of shops, building ways and fitting out docks, for which the Fore River Shipbuilding Co., which had then become a part of the Bethlehem Shipbuilding Corporation, acted as agent for the United States. Two separate plants were taken over by this firm for providing the machinery and boilers of the vessels to be built at Squantum. Work on the Squantum plant was begun in October, 1917. This plant consisted of some 43 acres and was practically all under a single roof, even the building ways and fitting-out slips being built under cover. The first keel, that of destroyer *No. 261*, was laid at this plant April 20, 1918, about seven months after the beginning of work for the construction of the plant. The first completed vessel was delivered from this works November 30, 1918, a little over one year from the date the plant was begun. When this time is compared with the former usual period of two to two and one-half years for the construction of destroyers in already existing plants, the remarkable expedition in production is apparent.

The conditions met with by our destroyers in the war zone were found by experience to be much more severe than had formerly been encountered in the usual service in American waters. The duties of these vessels in connection with convoys required a larger steaming radius than had formerly been necessary. Their work in connection with offense against submarines made a smaller turning circle very desirable. Vessels subsequent to *No. 185*, although they were made to conform as nearly as possible to the previous design, in order not to delay their construction, were given larger fuel capacity, a somewhat stronger hull, and a modified form of stern, with an increase of rudder area. Provision was also made that they might be able to carry 5-inch guns instead of 4-inch. In case this heavier battery became necessary. Their displacement was therefore slightly greater than their predecessors, being somewhat over 1,200 tons. Their other characteristics as regards size and speed being retained.

In addition to the 150 vessels originally ordered under the act of October 6, 1917, it was later found possible to place 9 more at navy yards, together with 3 vessels of the 15 remaining from the three-year program. These 12 vessels, *Nos. 336 to 347*, inclusive, were assigned as follows: Navy yard, Mare Island, 6; navy yard, Norfolk, 3; Bath Iron Works, 3.

Subsequent to the signing of the armistice, it became apparent that the large number of destroyers provided for in the war program might reasonably be reduced so far as the country's immediate needs were concerned. A survey of

this program was made, with a view to reducing the number of vessels under construction so far as it would be economical to do so. It is an evidence of the great effort which was being given to carrying this large program to completion that, as a result of this survey, it was possible to cancel but six vessels without incurring a great waste. These six vessels were *No. 200 to 205*, building at the Newport News Shipbuilding Co. It will therefore be seen that when this program is completed the United States will have a total of 267 high-speed destroyers of the most modern type, exclusive of the last 12 in the three-year program held in abeyance.

As already referred to, under peace conditions it normally required two and one-half years from the date of authorization of destroyers until their completion. Due to the expedition naturally resulting from the commencement of the war in Europe, this time was reduced to an average of approximately two years. When the armistice was signed, in November, 1918, there had been placed in service during the war period 41 new destroyers, including 35 of the vessels authorized in the acts of August 29, 1916, and subsequent thereto. The first of the latter group was delivered in April, 1918, giving an average of five vessels a month between that time and the date of signing the armistice. The construction of these vessels represented only the expedition which was being developed during the time that the plant extensions were going forward, and it is difficult to estimate what production might have been reached had the war continued longer. Some idea of this may be gained, however, from consideration of the fact that the impetus to production developed because of war activities resulted in an average delivery, even with the slackening up of production on account of the termination of the war, of about 10 vessels per month during the year following the armistice.

Remarkable as was the entire performance of the various shipbuilding yards on the destroyer program, there are a number of individual performances on particular ships which are notable. Perhaps the most remarkable was the performance of the navy yard, Mare Island, by which the destroyer *Ward, No. 139*, was launched in 17½ days from the laying of the keel. This vessel was one of a group of five building at the same time, fabrication of which started in January, 1918. The keel was laid May 15, 1918, and the vessel was launched on June 1 following. The vessel was entirely completed and in commission at the time of trials, which were begun September 1, 1918, or 109 days from the laying of the keel. Another performance worthy of note was that of the Fore River plant of the Bethlehem Shipbuilding Corporation on the destroyer *Mahan, No. 102*, the keel of which vessel was laid on the 4th day of May, 1918, and the delivery of which was effected on the 24th of October, 1918, 174 days after the laying of the keel.

Of all the destroyers in commission in the United States Navy during the war only two were lost. Only one of these vessels was lost as a direct result of an enemy action. The U. S. S. *Chauncey* sank as a result of a collision with the British steamship *Rose* at night November 19, 1917, while both ships were in the war zone and completely darkened, as was necessary due to the submarine warfare conditions. Three officers and 18 men of the *Chauncey* were lost. The U. S. S. *Jacob Jones* was torpedoed and sunk almost immediately on December 6, 1917, in the war zone while on war duty in connection with submarine patrol. Two officers and 62 men of this vessel were lost. Both of these vessels were older types and were in service long before the commencement of the war program.

As a result of war operations, there were naturally many accidents and collisions in which destroyers were concerned. In this connection, several incidents will show the remarkable ability of these vessels to stay afloat and to operate under circumstances in which it would be difficult to conceive of their being anything but a total loss. The U. S. S. *Manley* on March 19, 1918, in going alongside a British vessel at sea for the purpose of delivering messages to that vessel, came in contact with the British vessel in such a way as to explode a depth charge carried on the *Manley*, which explosion resulted in the explosion of other depth charges. The entire after end of the *Manley* abaft of frame 147, including the after deck house, was blown off. Other serious damage to the vessel resulted because of the explosion and the subsequent fire. The vessel was nevertheless kept afloat and subsequently brought into port and repaired. The U. S. S. *Shaw* was in collision due to disabling of her steering gear with the H. M. S. *Acquitania* October 9, 1918. The *Acquitania* struck the *Shaw* on the bow forward of the bridge and cut completely through her, severing the bow from the rest of the ship for about one-

quarter of her length, setting fire to the fuel in the forward oil tank. Subsequent to this damage, the officers of the ship navigated her into Portland Harbor (England) under her own power.

In preparing the design of destroyers which constituted the war program such features were incorporated as would fit them for any service they might be called upon to do, so far as it was possible in the light of service experience available at the time from our own operations and from abroad. Developments of the methods pursued in conducting war operations and the results of experience of our own vessels in the war zone led to the undertaking of a number of modifications to increase the efficiency of the vessels, both for improvement in their seagoing qualities and in their condition for military operations. Particular arrangements were made for an installation of highly specialized apparatus for the purpose of stowing and releasing depth charges used offensively in the destruction of submarines. Certain of the destroyers were provided with special mine-laying tracks in case it became necessary to use them in high-speed mining operations. Due to the continuous bad weather in the North Sea, the bridges had to be inclosed in order that the personnel engaged in navigating the vessel might have better protection than was necessary under the usual conditions obtaining on this side of the Atlantic. Due to the strenuous service of the vessels, a number of changes were necessary in living arrangements to provide for the personnel, better comfort under periods of sustained stress. The vessels were originally designed for a complement of 95 men. Due to the large number of vessels rapidly coming into service, it was necessary to increase the complements of operating vessels, in order to train crews for those to be commissioned later. Consequently, accommodations had to be provided for 9 officers instead of 6, and for 140 men. Developments in radio communication and in radio compasses required modifications to accommodate these new developments. Provisions were made for the development of special listening devices for the purpose of tracing submarines by means of the sounds given out by submerged vessels while under way. These devices were very effective in hampering the active offensive operations of submarines. Special winches were developed for towing kite balloons used in connection with searching out submarines.

The record of the first flotilla of destroyers sent to the war zone was the subject of world-wide comment, including the attitude of the personnel. Boats and crews were ready for active service immediately upon completion of the trying voyage to Queenstown, as soon as supplies of fuel, etc., could be put abroad. During the entire service of all the United States destroyers abroad every vessel was ready for duty upon short notice whenever called upon, excepting those which were seriously damaged as a result of military activities.

SUBMARINE CHASERS.

Early in 1916 the Navy Department began an investigation of the possible resources of the United States in pleasure craft and other small power-driven vessels which would be available for use as patrol boats should the necessity arise. The Assistant Secretary of the Navy, Mr. Franklin D. Roosevelt, took a special interest in this matter and started a campaign to interest prospective owners of pleasure craft in designing their boats so that they could readily be converted to patrol uses. Naval architects and their clients were encouraged to submit their designs to the Navy Department for criticism before building. In order to give further impetus to this movement, the bureau decided to contract for the construction of two small boats of the pleasure-boat type as models, which private owners might wish to follow.

Several different yachtsmen and yacht builders became prominent in the agitation for the organization of a fleet of small patrol vessels. Among these were the Electric Boat Co., of Bayonne, N. J., headed by Mr. Sutphen. This firm had designed and been responsible for building a large fleet of 80-foot motor-driven vessels which had given efficient service in British waters.

It was evident from the designs which were submitted for criticism that the so-called pleasure power boat was not a reliable and seaworthy craft and that the Navy Department could expect very little in the way of effective additions to its force of small vessels by taking over available pleasure craft in the event of war. Such craft were clearly not seaworthy to the extent demanded for naval service, due to the fact that the average small yacht owner is not interested primarily in being able to go to sea in any weather; being able to choose his time in going from port to port, and therefore pre-

fers not to sacrifice, for the sake of seaworthiness, such characteristics as roomy, light deck structures, comfortable quarters, easy motion, appearance, etc. The machinery is also unreliable for continuous running, being generally designed to obtain a maximum speed during brief intervals and under favorable conditions, rather than for hard service.

Mr. A. Loring Swasey, now vice president of the Herreshoff Manufacturing Co., but at the time a yacht designer of Boston, Mass., had been responsible for the design of a number of motor boats particularly intended for patrol purposes, and had prepared plans from which a 45-foot boat was built by George Lawley & Son for the department. In February, 1917, Mr. Swasey came to the Bureau of Construction and Repair under the terms of a special contract to assist in the preparation of designs for a suitable type of motor-driven patrol vessel. This program was in charge of Naval Constructor J. A. Furer, United States Navy. Mr. Swasey was later enrolled as a lieutenant commander in the Reserve Corps and detailed as superintending constructor, New York City, the headquarters of a district in which the greater number of the chasers were built, rendering valuable services in connection therewith, as well as in other directions.

On account of the shortage of structural steel, and even more on account of the class of labor required for steel construction, all of which was then needed for building destroyers and merchant vessels, it was decided that the patrol boats would have to be built of wood. It was fully appreciated that this would impose undesirable limitations on the characteristics of the boats. As usual, much attention had to be given to keeping the weight within the smallest limits possible without sacrificing strength or impairing the seaworthiness of the boats.

There was practically no choice as to machinery installation. Steam engines were out of the question because of the lack of capacity for building light-weight propelling machinery in quantity. Even as to gasoline engines, it was found there was no choice, as the question of quantity production entered into the problem, and the Standard Motor Co., which had furnished equipment for the British patrol fleet built in this country, was the only one of demonstrated capacity, or known to be in a position to make required deliveries.

After the completion of the preliminary design, plans, and specifications were submitted to the department by joint letter of the Bureau of Construction and Repair, Steam Engineering, and Ordnance, on February 23, 1917, suggesting reference to the General Board, for recommendation as to the desirability of building vessels of such type and as to the military characteristics of same. Following a conference with representatives of the General Board, the design was further developed and a consultation with representatives builders of wood yachts and boats on the east coast and Great Lakes, at the Navy Department, on March 12, 1917, resulted in the appointment of a committee, consisting of Mr. Lowry, of the Gas Engine & Power Co., Morris Heights, N. Y.; Mr. Jacob, of the Jacob Shipyard, City Island, N. Y.; and Mr. Murray, of Murray & Tregwetha, South Boston, Mass., which undertook to examine the design with particular reference to details from the standpoint of the practical builder, as to the ease and rapidity of construction, etc. This committee finished its work within a few days and certain changes were incorporated in the plans, which were furnished to prospective bidders on March 18.

Orders were issued on March 19, to the navy yard, New York, for the construction of 60 boats, and to the naval station, New Orleans, for 4 boats. As a result of the first opening of bids, March 21, contracts were placed with private firms for 41 boats. On the basis of a second opening of bids, March 31, contracts were placed for 179 additional boats, and orders for 71 more were given to the navy yards at Norfolk, Charleston, Mare Island, and Puget Sound, making a total of 355 boats in all. Fifty of these were turned over to the French Government, which also requested 50 more, and these were also ordered, together with 42 for this Government, making a grand total of 447 boats, exclusive of one originally numbered 139, which was never started. Six of the 447 were canceled after the armistice.

The general characteristics of the completed design were as follows: Length, over all, 110 feet; length, 105 feet between perpendiculars; beam, 15 feet 4½ inches; draft aft, 6 feet 3 inches for displacement of 75 tons; mean draft, 5 feet 3 inches for displacement of 75 tons; freeboard forward, 9 feet 9 inches; freeboard aft, 4 feet 1 inch. Propelling machinery: Three 6-cylinder, Standard marine gas engines; bore, 10 inches; stroke, 11 inches; brake horsepower, 220;

revolutions per minute, 460; weight, 6,300 pounds, each; one 2-cylinder 4½ by 5½ inches auxiliary engine driving a 4½-inch kilowatt dynamo and pumps. Speed at displacement of 66.5 tons: With 1 engine at 370 revolutions per minute, 9.4 knots; with 2 engines at 460 revolutions per minute, 14.25 knots; with 3 engines at 460 revolutions per minute, 16.85 knots. Cruising radius, at 10 knots, 900 miles. Fuel capacity, 2,400 gallons of gasoline. Fresh water capacity, 945 gallons. Armament: One 3-inch 23 caliber gun; 2 machine guns; 1 depth-charge projector. Complement: Two officers, 24 men.

The following narrative submitted from the office of the naval constructor, navy yard, New York, is of interest as furnishing a brief description of the design as sent out, the methods followed in turning out the largest group in record time, etc.:

"As soon as sufficient data and plans had been prepared by the designing organization of the Bureau of Construction and Repair to enable builders to proceed with estimates, proposals were sent broadcast among the navy yards and private boat builders, calling for bids to include the number, cost and time of delivery. The navy yard, New York, telegraphed back its bid to build 60 or more of the boats for \$30,000 per boat. The yard proposed to lay down 40 boats immediately, promising delivery of the first boat in 80 days after the receipt of the order to proceed, and the remaining boats at the rate of one boat every three days. The yard stated further that it had material on hand for the 10 boats and a one week's option on the material for the remaining 50 boats. This bid was immediately accepted by the Navy Department, the official order to the New York yard to proceed with construction being received by the latter the same day.

"The plans forwarded by the Bureau of Construction and Repair showed the projected boat to be a stout, flush-decked boat 110 feet overall, 15 feet 4½ inches beam, and 4 feet 10 inches draft. The displacement was to be 60 tons. The propelling machinery consisted of three 220-horsepower standard gasoline engines, driving triple screws. It was estimated that this plan would drive the boat at a maximum speed of 18 knots an hour, and that the gasoline capacity of 2,400 gallons would give the boat a cruising radius of 1,500 miles at 12 knots.

"As originally designed, the boat was armed with two 6-pounder rapid-fire rifles, but later modifications caused the forward gun to be replaced by a 3-inch gun, and the after gun by a Y-gun capable of projecting the standard Navy destroyer depth charge. In addition to these the boat was armed with two machine guns. Before the completion of the first boat, the development of underwater listening devices had advanced sufficiently to enable a fairly efficient device to be fitted on the chasers. A small radio outfit completed an offensive outfit which rendered a squadron of the chasers a very grave menace to a U-boat in their vicinity.

"The boat was divided into eight compartments by six steel and one wooden transverse, water-tight bulkhead. The peak compartment, cut off by No. 1 steel bulkhead, was for use as a storeroom for lines, deck gear, etc. The compartment between Nos. 1 and 2 bulkheads was the crews' quarters, fitted with pipe berths for 16 men. Next came a small compartment for the forward ammunition stowage. Just abaft this was the compartment containing the four gasoline tanks. Over the top of the tanks a heavy floor was laid, and the space above was utilized for the radio room and for the two officers' staterooms. Next aft came the main engine room, and then a small compartment for depth-charge stowage. Aft the last steel bulkhead was a combination mess room and sleeping compartment, and in the same space, but separated from the main room by a light wood bulkhead and door, was the galley. The water-tight wood bulkhead separated the galley from an after lazarette compartment used as a food storeroom.

"On top of the forward end of the engine-room hatch was placed a pilot house surrounded by a miniature bridge and communicating directly with the officers' staterooms below. A single mast, fitted with a crow's nest and radio yard, completed the boat's structure and gave it a graceful and seaworthy appearance.

"The receipt of the order to build found the New York yard with an organization which could readily be expanded to meet the demand for speed. While only a limited number of boat builders were then employed and new ones were not to be had, there was a practically limitless supply of house carpenters to draw from, and these could be, and were, organized into gangs under the supervision of experienced boat builders, and quickly taught to perform some special operation of the construction.

"The first step, of course, was the providing of material. While there was enough lumber on hand to start actual operation, it was necessary to list and to make or purchase innumerable items of fastenings, castings, deck equipment, galley fittings, toilet fixtures, etc. This involved the preparation of specifications, submission of requisitions, awarding of contracts, and the follow up of deliveries.

"Parallel with this ran the compilation and writing up of detailed construction operations, the purchase of additional woodworking machinery, and the reorganizing of the boat-building force to meet the proposed method of building. To hasten actual erection work, some of the fabricating work was let out on contract to mills in the vicinity, and in a surprising short time began to show results.

"In deciding upon the site for erecting, the requirements for launching were the determining considerations. As no water-front space was available it was decided to launch the boats by picking them up with big cranes. Two spots were then decided upon, one adjacent to No. 4 Dry Dock, where the 50-ton traveler could pick up the boats and put them into the dock, and the other on the ordnance dock, where the floating derrick could haul the boats across to the water's edge on skids and then pick them up and put them in the water.

"Actual work was then started, one gang laying keels, one after the other; another gang framing the boats; another putting in bulkheads; another planking, etc. One operation followed another with increasing speed as the gangs became familiar with their one operation.

"As soon as the first boat was launched, the installation of engines was begun by the Standard Motor Co., of Bayonne, N. J., which held the contract for the construction and installation of the power plant in all the chasers. By the expiration of the 80 days specified for delivery of the first boat, it was completed and trial trips were begun.

"As this was the first boat of a new class, the trials were quite extensive. Several types of propellers were tried out until the best combination of pitch and diameter was obtained. Under the best conditions, the boat attained a speed of approximately $17\frac{1}{2}$ knots per hour. The reduction from the designed speed was attributed to changes in the design of the boat, which somewhat increased the weight over that originally contemplated. The boat proved seaworthy and strong and seemed to come up to expectations in all respects.

"The construction work proceeded smoothly from then on, the hulls being finished on scheduled time. The Standard Motor Co. was not able to keep pace with the hull construction, however, and the actual deliveries of boats was somewhat slower than was anticipated. The last boat was not completed until approximately one year after the receipt of the order to build." The records show that the first boat was put overboard at New York on May 7, and was ready for gun-firing trials on May 9, within 50 days of receiving the order. This was a remarkable achievement, in view of the fact that many detail plans had to be developed, materials purchased, etc.

Although unavoidably cramped and uncomfortable, these 110-foot boats did splendid service, especially in the Mediterranean, and in releasing larger vessels for heavier or more important duties. Their behavior in a heavy sea was surprisingly good, as illustrated in the case of one flotilla which while en route to Gibraltar from the Azores ran into a heavy gale. On reaching port it was found that the more powerful vessels which were escorting the boats had been badly battered, while the chasers themselves were entirely undamaged.

Criticism directed against the chasers applied more generally to workmanship, which showed apparent defects in some respects, as was to be expected to a certain extent, due to the conditions under which the vessels were built. This applies particularly to the calking in the case of small boats proceeding immediately on a long, hard sea voyage after a hurried completion. The minor troubles experienced on vessels sent to Europe were chiefly with machinery and on account of inexperienced personnel. The general design was uniformly commended, both by our own officers and the French.

Rear Admiral McCully, in a report submitted in January, 1918, commented as follows on the seagoing qualities of the chasers:

"Sea qualities of chasers.—Every officer of the squadron has remarked on their excellence as sea boats, and they are seaworthy to a remarkable degree, more so than the yachts. They take seas from any direction easily and gracefully, were never observed to ship a sea, and if carefully handled would probably last through any sea.

"They roll about 9 to 10 complete oscillations per minute and lie naturally broadside to the wind when without headway. Under way their best point is with wind and sea about three points on the bow. They ride very well with wind on the quarter; but if given too much speed, may broach and be beaten down by heavy seas, as one did. This boat was thrown on her beam ends and held down with the pilot house in water up to the windows, but recovered and came out all right, losing, however, two men who were washed overboard, three other men who went over at the same time holding onto the towing strap and being saved. The boat was undamaged except that lee life rail and canvas screen about pilot house were carried away.

"These boats will safely carry a deck load of fuel and stores amounting to 2 tons in weight; and if they be composed of gasoline, increase their radius to about 1,700 miles.

"When lying to in a heavy sea the chasers do not drift to leeward so fast as larger vessels. They ride very comfortably to the sea anchor as fitted."

The French officer who had command of the second group of chasers on the trip across stated in his report:

"During the voyage the chasers nearly all had at least two days of rough weather, and they showed excellent seagoing qualities. These ships are thoroughly seaworthy and keep the sea quite as well as the convoys."

The commanding officer of the Third Squadron likewise reported:

"The chasers proved exceedingly seaworthy. The very bad weather experienced on the voyage from the Azores to Lelxoes proved this conclusively."

The report of the commanding officer of the *Hannibal*, covering the return of a detachment of 32 chasers in the early part of 1919, after a year or more in European waters, showed that the entire voyage was completed with only minor difficulties, the weather having been favorable, however, throughout the trip.

Twenty-four chasers were utilized in conjunction with 32 mine sweepers in cleaning up the North Sea barrage and did not leave Europe until late in September, 1919.

From several points of view the 110-foot chasers are an ideal type for hunting submarines. They can be brought to a standstill from full speed very quickly, their turning circle is very small, and on account of there being practically no auxiliaries except the blowers and generating set, with storage batteries for current in emergencies, all sound can be quickly suppressed when desired, permitting the use of listening devices at maximum efficiency.

A schedule of chaser contracts is attached, as a matter of record:

SUBMARINES.

Prior to the authorization of the three-year program in the act of August 29, 1916, there were in commission or under construction 75 submarines, including 14 of the A, B, and C class—small boats of about 100 to 250 tons, suitable only for local harbor defense, and 16 of the D, E, F, and G class, practically in the same category, although of some additional value for training purposes. Thirty-one of the 75 were still under construction in April, 1917.

The three-year program provided for 58 coast submarines, of which 30 were immediately authorized, including three S boats (800-ton class). Of these, one each was assigned to the Lake Co., begun at Bridgeport in February, 1917; one to the Electric Boat Co., begun at Quincy in March, 1917; and one, of department design, assigned to the Portsmouth navy yard in September, 1917. The other 27 boats—R class—were divided between the Electric Boat Co. and the Lake Co., the former contract, dated January 8, 1917, being for 20 boats, and the latter, dated February 19, 1917, being for 7 boats.

The act of March 4, 1917, authorized construction of 18 more of the 58, also of the 800-ton class, 10 of which, department design S boats, were assigned to the Portsmouth yard on March 16, 1917.

The same act also specifically authorized 20 boats additional to the three-year program, and the Electric Boat Co., was awarded a contract for 24 S boats of its own design on July 17, 1917, the remaining 4 to make up the 38 carried in the act being ordered of the Lake Co. under date of July 12, 1917, on department designs.

In January, 1918, the Electric Boat Co. took up with the department the question of taking over 6 submarines of the H-class design, which were originally contracted for by the Russian Government, but withheld owing to conditions which had arisen. These boats had been partially constructed and crated for shipment, the parts being assembled in different localities in the United States and Canada. The proposition presented was to have this material diverted either to a shipbuilding concern in the United States or to a navy yard, and there assembled from the "knock-down" condition. After considerable negotiation, it was finally decided to take over these 6 boats and have them assembled at the navy yard, Puget Sound. This decision was reached and authority was given the Puget Sound yard to proceed in May, 1918.

With regard to these 6 H boats, it was definitely understood by the bureaus and the department that the boats, when completed, would not be up to date, nor would they be modern submarines in size, type, or equipment. They were taken over purely as a war measure. Actual construction work was commenced

at the Puget Sound yard in May, 1918, and the boats were completed and delivered in September, October, and November, 1918. The Puget Sound yard did very creditable work in completing these vessels, and they successfully fulfilled their contract requirements. Due consideration being given to the type and design, they may be considered reasonably satisfactory boats, their military value being more in the nature of harbor or local coast defense.

The 6 H boats were covered by funds provided by the act of October 6, 1917, and on August 1, 1918, the department authorized the construction of 24 additional S boats. Fourteen were tentatively assigned to the Electric Boat Co. and 10 to the Lake Co. When the armistice was signed the department decided to cancel 14 of the 24. Contracts for the remaining 10, which were not finally placed until July, 1919, completed the 58 carried in the three-year program. This class of 10 boats are improved S class, six being the Electric Boat Co. design, of slightly greater displacement than S-1. The four assigned the Lake Co. are the department design of slightly greater displacement than S-3.

During the spring of 1917 the department issued various instructions relative to precedence to be given to vessels under construction. Submarines had various positions in this precedence list, ranging from No. 9 to No. 4, but owing to their success in antisubmarine work it was ultimately decided by the department to place the construction of submarines with, but after, destroyers. This decision came too late to obtain the maximum rapidity for submarine construction. Furthermore, the yards where the majority of submarines were building were also building destroyers, which had the right of way. The net result of this procedure was that, with the exception of six R-boats at the Union Iron Works and the six H-boats at Puget Sound, no really rapid construction work was accomplished.

The six R-boats (*R 15 to 20*) built at the Union Plant of the Bethlehem Shipbuilding Corporation, San Francisco, were actually constructed in a remarkably short time after construction work began. They were delivered in a little better than four months ahead of their contract time, and the contractor received a bonus in accordance with the terms of the contract for this early delivery.

A few months after the entry of the United States into the war authentic information relative to war experiences of allied submarines in the war zone began to arrive in the department, and this information continued to come in throughout the period of the war. All of this information was carefully analyzed; such alterations, modifications, and improvements which service in the war zone indicated as absolutely necessary were made as far as practicable in the boats under construction. It was fully realized that this would delay the completion of the vessels, and every effort was made to keep down the number of alterations to those which war experience had proven to be absolutely necessary.

The *K 1, 2, 5,* and *6* were sent to the war zone (Azores) in October, 1917. The department and the bureaus concerned fully realized the comparatively small value of these vessels for distant duty, but on account of the numerous sinkings of isolated merchant ships in the vicinity of the Azores it was considered desirable to establish a base there and man it with American submarines. This action had the desired effect, and the number of sinkings was markedly reduced as soon as the submarines arrived. It was contemplated at the time to relieve these four vessels by another division of submarines as soon as they became available, and such action was actually taken by the department in September, when the Lake L class was sent to the Azores to relieve the *K* class.

Seven *E. B. L*-boats and the *E-1* were sent to the war zone via the Azores in December, 1917. The *E-1* remained at the Azores, while the seven L-boats were assigned to Bantry Bay, Ireland, where they gave an excellent account of themselves. After a period of intensive instruction with the British they were given their own billets and successfully operated therefrom thereafter. The British credited this division with sinking one German submarine. Their greatest value, however, was in keeping German submarines away from this part of Great Britain, thereby materially reducing the number of merchant vessels destroyed.

Various coastal patrol work was done by submarines attached to the submarine base, New London, Conn. This work was generally local and was in addition to the duties performed by these vessels as training and experimental boats.

The *O-1* to *O-10* were assigned to extensive work in the patrol of the eastern Atlantic coast and did excellent work. This division proved itself very reliable and may be considered as representing a very material improvement over previous submarines. They were ordered to the war zone via the Azores and arrived at the Azores the day the armistice was signed.

From April, 1917, until November, 1918, 40 submarines were delivered, as follows: 1 *L* boat (*L-8*), lake type, 1917; 3 *N* boats, electric-boat type, 1917; 1 *M* boat (*M-1*), electric-boat type, 1918; 3 *L* boats, lake type, 1918; 4 *N* boats, lake type, 1918; 8 *O* boats, electric-boat type, 1918; 1 *O* boat, electric-boat type, 1918, Portsmouth; 1 *O* boat, electric-boat type, 1918, Puget Sound; 3 *O* boats, lake type, 1918, west coast; 3 *O* boats, lake type, 1918, east coast; 6 *R* boats (*R-15-20*), electric-boat type, 1918, west coast; 6 *H* boats, electric-boat type, 1918, Puget Sound.

In August, 1918, Commander E. S. Land, who had been on duty in the bureau in connection with submarine design following the transfer of Lieut. Commander E. S. Howard to Portsmouth for the supervision of boats built in that yard, in January, 1917, was ordered to Europe for an inspection of the principal submarine yards in England, France, and Italy, and was later able to make an examination of submarines in the water and on the ways in Germany as well as of German submarines at Harwich and Portland in England.

In February, 1919, the department decided to take over six German submarines, and the following vessels came to the United States under their own power, being manned by American officers and crew: *U-117*, *U-111*, *UB-148*, *UC-97*.

The *U-140*, being in a partially dismantled condition, it was necessary to tow her over, and she is now at the navy yard, Portsmouth.

The inspection trip referred to above indicated that very satisfactory progress was being made in submarine design and construction of submarines for the United States Navy as compared with results obtained abroad. There were found many points of interest in connection with the designs of foreign submarines—some worthy of adoption and others to be avoided. Very complete comparative trials were conducted with the German *U-111* and the *S-3* in August, 1919. Both were built in 1917-18, are generally similar in dimensions, armament, complement, etc., but the *S-3* showed considerable superiority in speed—particularly submerged, and about 20 per cent greater maximum radius of action on the surface at 11 knots against 8 knots for the German boat, with an equal endurance submerged at 8½ knots against 5 knots.

EAGLE BOATS.

In the autumn of 1917 the construction of destroyers had been undertaken to the limit of our capacity. The 110-foot subchasers were being delivered rapidly, but little experience had been had with them, and naval opinion of the small wooden vessels, at that time, was not as favorable as it became after some of them had been placed in commission.

The great effort to develop listening devices for the location of submarines from surface vessels was beginning to show results, and the groups engaged upon this work were convinced that they had developed devices which would be thoroughly satisfactory in service, although it developed subsequently that they had been somewhat too optimistic.

Under the circumstances and under the conditions existing, with the submarine menace still of the utmost gravity, there was great desire for the construction of additional antisubmarine vessels. Evidently this could be done only by developing some entirely new source or sources of supply. With the great pressure upon the mechanical and industrial resources of the country for Army work in addition to Navy work, the prospect for the rapid construction of additional vessels was not very rosy at this time, although preliminary plans had been prepared in the bureau of the department for steel vessels much smaller than destroyers, but larger than the 110-foot chasers, with a greater cruising radius, and specially fitted to search for and locate submarines by means of the listening equipment which was then being rapidly developed.

Such were the conditions when on December 24, 1917, the Secretary of the Navy received from Mr. Henry Ford a letter in part:

"For some time past the submarine menace has caused us to give consideration to some method of checking its destructive work and to formulate some plan whereby this could be brought about. From investigations made by us

we believe that the great need for 'submarine detector-destroyers' is apparent, and these should be built at once. We have been much impressed with the progress made in the development of detective devices, and it is our opinion that if suitable boats are built and properly equipped with this device, it will be the best means of meeting the submarine problem next summer.

"I have had the privilege of personally discussing the needs of devices for fighting the submarine with British naval officers who have been in active service during the war and whose ideas seem to coincide with mine that the present 84 and 110 foot so-called submarine chasers are not of sufficient speed—not seaworthy enough—nor capable of permitting guns of sufficient caliber to be mounted thereon for effectively coping with the submarine; and, lastly, these smaller boats are most wearing on the physical resources of the crews.

"Torpedo-boat destroyers can not be built in time and in sufficient numbers to bring about the destruction of this menace to shipping.

"Further, the destroyer is too noisy to be used as a satisfactory listening boat if equipped with detection devices.

"We are also convinced of the fact that there are ample steel making and fabricating plants in the Middle West to furnish all the material necessary (which is not of comparatively large amount) without interfering with any Government war program. On this point we have been informed by persons of wide experience and of competent judgment.

"We are also advised that the most effective boat which the British Government has developed in their fight against the submarine is a so-called 'P' boat, or what might be termed a seagoing tug. A slight modification of this as a listening boat can be built as a detector and destroyer of submarines, and can be constructed at about one-sixth of the cost and six times more rapidly than our destroyers.

"To overcome this menace we believe it will probably be necessary to construct at least 500 of these boats.

"A fleet of this new type can be built in the United States by utilizing the capacity of plants not now engaged in or identified with any naval or shipping program.

"This plan will make no drain nor call upon any labor now engaged in the shipbuilding within or without the United States. We are confident that men can be trained for this work in all its departments from our own organization and from the ordinary or general supply of labor as rapidly as needed. This is a cardinal consideration.

"We will undertake the construction of these boats with all possible speed and deliver them to the United States Government without profit to us.

"It is our intention to accomplish this work in centers where no unusual railroad congestion now exists."

To this the Secretary of the Navy, under date of December 24, 1917, replied by telegram as follows:

"Your letter 22d offering your services to construct submarine patrol vessels without interference with present programs interests us. Designs of such vessels had already been begun by department. Suggest you send ample force of your engineers and production men to work with our designers and get full information so you can submit definite proposition as soon as possible. This matter should be kept secret."

In response to this telegram, Mr. Ford, with a party of his engineers and representatives, came to the Navy Department and discussed with the Secretary and the Bureaus of Construction and Repair and Steam Engineering the whole project. It was agreed that for any boats undertaken to be built upon the plans of the Navy Department, the first thing to be done as far as the department was concerned was to supply the necessary plans. This work, in the Bureau of Construction and Repair, was placed in the hands of Capt. Robert Stocker, Construction Corps, United States Navy, assistant chief of bureau, and in charge of the Design Division, the numerous draftsmen engaged upon the project being under the immediate direction of the chief draftsman of the bureau, Mr. W. M. Wallace. Capt. Stocker and his assistants undertook the development of the design with the utmost energy, work being carried on night and day, and practicable plans being developed in an unprecedentedly short time. Plans and specifications were delivered to a representative of Mr. Ford on January 12, 1918, and a definite proposal was requested, this being received on January 15 in a telegram addressed to the Secretary of the Navy, which stated:

"Complying with your request for a more definite proposal as to the construction of a patrol boat for detecting and destroying submarines, such boat to be 200 feet long, 25 feet 6 inches beam, and approximately 500 dead weight capacity, and equipped with 2,000 horsepower turbine engines, designed for 12 knots an hour cruising speed and 18 knots emergency speed, we beg to say we have made careful investigation and have had the advice of experts, and we are prepared to proceed immediately to construct according to your plans and specifications from 100 to 500 or more of these vessels and will prosecute the work with utmost dispatch and exert our utmost endeavor and deliver 1 boat in 5 months or sooner, 10 boats in 1 month thereafter, 20 boats in the next succeeding month, 25 boats in the next month, and then at the rate of 25 boats per month after first 100, and could increase delivery very rapidly. We will do this work on the basis you suggested, namely, an estimated cost plus a fixed sum with a savings clause such as is usual in your contracts, payments to be made promptly as our expenditures are made. We have made an estimate of cost based upon present conditions and after conferring with experts and taking some figures on power plant and other parts of the work are willing to undertake this work upon an estimated cost of \$275,000 per vessel, at the same time expressing our belief that this is a liberal figure and that there would be considerable savings. However, we are not boat builders and will not assume responsibility in damages if the cost should exceed this, nor do we assume responsibility for performance of boats. We estimate the requirements for buildings and ways and equipment especially needed for this work at not exceeding \$3,500,000, to be paid by you as expenditures are made and to be sold for your account at the conclusion of the work either at the value of same to us or third persons at your election. Please do not misunderstand our position. We are not soliciting orders, but are willing to assist the Government by undertaking this work as of the highest and most vital importance, but impossible of accomplishment without disturbing or seriously impairing present program of the Navy and Shipping Board."

The plans and specifications as completed were forwarded to the Secretary of the Navy for approval, through the General Board, which recommended, with certain reservations as to battery and sustained speed, the immediate construction of 100 of the boats, with such later increase as occasion might require. The Secretary of the Navy approved the project in accordance with the recommendation of the General Board on January 17, upon which date a telegraphic order was addressed to the Ford Co. to proceed with 100 boats, the details of the contract to be arranged as soon as practicable. Later 12 additional boats intended for the Italian Government were ordered.

The salient features of the contracts with the Ford Motor Co. for the construction of Eagle patrol boats were as follows:

The original contract, dated March 1, 1918, covering 100 boats and stated that "time is the essence of this contract" and that "the contractor shall use every endeavor to deliver the first of said vessels within five months from the date of this contract, 10 boats within one month thereafter, 20 boats within the next following month, and 25 boats a month thereafter." It provided that the contractor construct all buildings, building slips, plant, and other special facilities, in addition to those already in its possession, for the special purpose of building the vessels contracted for, and to be paid for by the department at their actual cost, not to exceed \$3,500,000, no profit being allowed the contractor on such costs. It also gave the contractor, upon completion of all work under the contract, the option of taking over the special plant facilities at appraised values determined by the compensation board. The price to be paid for the vessels was to be actual cost plus a fixed fee of \$20,000, with a provision that 25 per cent of the savings, if any, under the estimated cost of \$275,000, revised as provided for in the contract, be paid the contractor in addition to the fixed fee of \$20,000.

A supplementary contract, dated July 10, 1918, provided for building 12 additional boats under the same conditions as obtained in the original contract.

A further supplementary contract, dated October 7, 1918, was made on account of the fact that a number of the patrol boats could not be completed at Highland Park plant of the contractor in 1918 before the close of navigation on the Great Lakes, and to provide additional plant facilities on the east coast so that the assembly and completion of such patrol boats could be carried on and delivery made during the winter. The Ford Co. was authorized in this

contract to provide additional buildings, plant, and other facilities on land owned by it at Kearny, N. J., the expenditures for such plant being limited to \$2,500,000; the total expenditures for plant and all other facilities at both Highland Park and Kearny not to exceed \$5,500,000. The provisions of the original contract as to profit on expenditures for plant facilities at Kearny, and as to disposition of same, were extended to this supplementary contract.

In accordance with the contract the Ford Co. erected a shipbuilding plant at River Rouge on the outskirts of Detroit for fabricating and assembling the hulls of the vessels. The main propelling machinery was largely built at the Ford Motor Co.'s main plant, Highland Park, Detroit.

Perhaps the greatest successful departure made by the Ford Co. from ordinary shipbuilding methods was in connection with the assembling and launching of the hulls. In ordinary ship practice, the hull of the vessel is constructed upon land and transferred to the water by sliding down greased ways placed longitudinally or transversely. At River Rouge there was located a building 1,702 feet by 306 feet, containing three railway tracks running lengthwise. Twelve trucks were provided, capable of carrying the completed hull upon the tracks.

Each track has seven erecting stations. Starting with a truck at the first station, the keel, etc., would be assembled; then the truck shifted to the second station, where the frames would be erected. At each succeeding station a certain definite group of operations would be performed and a certain definite proportion of the material incorporated. At the seventh station the hull was made ready for launching; then the truck hauled out of the building to a transfer bridge, which could take a truck from any one of the three erecting tracks. Owing to the question of grade, any ordinary system of launching or marine railway arrangement was out of the question, and the transfer bridge was so arranged as to deliver the boat on its truck to a fourth track onto a large hydraulic table. When the truck was secured on this table the latter was lowered into the water and the boat floated clear.

The Ford Co. undertook this enterprise with the greatest zeal and enthusiasm, the building described being erected and the plant generally ready for operation by May 1, 1918, or within a little more than 100 days from the receipt of order to proceed. The first keel was in place by May 7. In spite of unbounded energy and effort, the Ford Co., which was entirely without previous shipbuilding experience, found it impossible to prosecute the enterprise as rapidly as they had expected. There was great difficulty in training "green" labor so as to secure proper workmanship, especially as regards water and oil tightness, and the Ford Co. also found that the difficulties of finishing, ready for service, a vessel as elaborate and complicated as the Eagle boats (so named by the department) were great and time consuming, as well as more expensive than it had anticipated.

During the summer of 1918 it became evident that comparatively few vessels would be finished at the River Rouge plant before the close of navigation by ice upon the Great Lakes. It had been contemplated from the first that if necessary to deliver vessels during the winter a supplementary assembling plant would be erected at Kearny, N. J. After a good deal of discussion and some difficulty in obtaining permission from the War Trades Board, which regarded the Newark district as already somewhat congested and short of power, the erection of the supplementary plant at Kearny was undertaken. It had made but little progress, however, at the time of the armistice, and was suspended promptly thereafter.

Three boats were delivered and reached tidewater from the River Rouge plant before the close of navigation in 1918. An attempt was made to get out four more, making seven in all, in a more or less unfinished condition, but the last four were caught by the ice and returned to the builders in the spring of 1919 for completion and fitting for service. After the armistice of November 11, 1918, the work was no longer pressed, and the department, under date of November 30, 1918, canceled 52 of the total number of 112 boats originally ordered, leaving 60 to be completed during the season of 1919. Although, of course, the work was not pressed as under war conditions, and at one time there seemed to be doubt as to whether all vessels would be completed, the last one was delivered November 12, 1919.

It is interesting to note that 23 of those vessels were completed in September, 1919, rather indicating that the Ford Co.'s original estimate of 25 vessels a month was mechanically feasible, although it was seriously in error as to the time within which such a rate of production could be reached.

At the time this project was undertaken the experienced regular constructors in the Navy were all absorbed in important work, and arrangements were made by which one of the best-known shipbuilders on the Lakes, Mr. C. C. West, became the local representative of the Bureau of Construction and Repair charged with the inspection of the work. Capt. Stocker, who had been in charge of the design, kept in close touch with the work of construction, visiting Detroit as necessary. After the armistice, Mr. West returned to his regular business, and during the season of 1919, Commander Whitford Drake was inspector at the works, representing the Bureau of Construction and Repair.

It is not generally realized that the Eagle boats are vessels of considerable size. They are much larger than the early torpedo boats, and are in fact larger than the destroyers built prior to 1903. The destroyer *MacDonough*, commissioned in 1903, had a displacement of only 400 tons. The characteristics of the Eagles, as built, are as follows: Length, 200 feet; beam, 25 feet 6 inches; draft amidship, 7 feet 3 inches; normal load displacement, 500 tons; single screw, turbine driven; normal shaft horsepower, 2,000; overload shaft horsepower, 2,500; speed, 18.3 knots; cruising radius, 3,500 miles; armament, two 4-inch 50-caliber guns, one 3-inch antiaircraft gun, two machine guns, and one depth-bomb projector; complement, 5 officers and 68 men.

The Eagle boats have a peculiar appearance, being built as much as possible of flat plates to facilitate rapidity of construction. Nevertheless they are thoroughly seaworthy as shown by reports submitted by the commanding officers of numbers 1, 2, and 3, forwarded by the division commander in May, 1919, which were very favorable as to the performance of the boats after steaming from New York to Inverness, Scotland, over a 4,500 mile course, with green crews. The division commander's report stated:

"At sea the Eagles are very dry considering size, and living conditions good except in the after compartment. Some fairly bad weather has been encountered and their behavior has been good. * * * The boats are lively, but the motion is not as bad as might be expected."

While the report on Eagle 1 included the following statements:

"The sea-going qualities of this vessel under nearly all conditions have been more than satisfactory when properly handled. Owing to the peculiar construction of the vessel, it will probably be interesting to see how she will act under different conditions, and there I wish to point out the following, gained from my experience on board since commissioning under varied sea conditions:

(1) In driving into a head sea the vessel is very steady, but pounds to such an extent that I would not consider it advisable to force her into such a sea, especially at over 8 knots. (2) With sea on the quarter this vessel rolls very heavily. Our maximum roll on this vessel was 44° to leeward in a medium choppy sea. The force of wind at the time was about 7 (Beaufort's scale). (3) With wind dead astern the vessel yaws to such an extent that it is very difficult to keep her on her course. (4) With wind just off the bow the vessel is very steady and does not pound.

"This condition I consider the ideal sea condition for this type of vessel. At one time it was necessary for us to lay to in a comparatively heavy sea. Under that condition the wind holds the vessel over from 10° to 15°, but she is very steady.

"This vessel handles very easily at anything over 8 knots speed, but it is very difficult to handle in a tight place, as, for instance, around a dock, owing to the single screw and great wind surface; and then, this being a turbine ship, it takes at least a minute from standard ahead to stop and about two minutes from stop to full astern."

Various minor recommendations as to improvement in ventilation of quarters aft, alterations in chart house and bridge, etc., are receiving consideration.

A further report forwarded by the division commander in September, after steaming a total of 11,500 miles, confirmed the earlier reports with little additional comment. This report stated that the boats had been in use to maintain a dispatch service between ports in north Russia, and that each ship had made passages through considerable field ice on several occasions with no damage. It also remarked the fact, frequently commented upon by our own and allied officers, that there is practically no vibration at any speed. The boats in service will be available for "gunboat" duty in addition to their special function of patrol vessels.

A special report on Eagles 1 and 3, submitted by Rear Admiral McCully in July, 1919, described the behavior of the vessels under various conditions of

weather, including a moderate gale encountered in the White Sea, in which "the vessels behaved fairly well but motion was very violent." In head seas "very little water was taken forward, even over the low, sharp fore-castle, and no water except spray reached the high forward gun position." During target practice "each vessel made 17 knots without difficulty."

Admiral McCully also suggested various minor changes toward improving the habitability and seaworthiness of the vessels, his comments concerning which are not unfavorable, considering their type and size. The summary of his report states: "Lack of sufficient seaworthiness would make it inadvisable to use them for service in rough open waters. They would probably be very uncomfortable in the Tropics.

"They carry a good battery, well mounted, and are fairly economical. They are easy to handle when under way, turn quickly, but maneuvering alongside docks do not handle very well. At anchor in winds or currents they are dangerously uneasy unless modified. They are quite comfortable in temperate climates, and crews seem to like them.

"As to the character of service for which they are qualified, it would be difficult to say. They were evidently designed to hunt submarines in coastal waters, and near home ports, would be able to perform this character of service very well. As dispatch vessels in northern Russian waters, they were very serviceable.

"They would probably be of most value during peace in training officers and crews for manning destroyers in time of war. The experience gained by their commanding officer in piloting work along coasts would be invaluable.

"The Eagles arrived in good conditions, and have been maintained so by their crews alone. The waters in which they were required to serve have not been thoroughly surveyed; charts are imperfect. Navigational data is scanty, and the commanding officers in carrying out their duties have been hampered by ice, fog, strong currents, and other difficulties requiring most careful navigation. This they have performed excellently, so far without any accident, and the Eagles are leaving the station in even better condition than when they arrived."

TUGS AND MINE SWEEPERS.

Prior to entering the war, the Navy had in service about 50 tugs of all types, only 12 of which could be classed as seagoing. The necessity for large ocean tugs and for mine sweepers had been appreciated and considered in the fall of 1916, by the General Board, which laid down similar characteristics for the two types based upon those of the *Ontario* and *Sonoma*, designed and built as Navy tugs in 1912, the recommendations as to mine sweepers involving increased speed and a reduction in draft. The characteristics were approved by the department on December 6, 1916, and referred to the bureau for development.

As referred to elsewhere, the various inspection boards, immediately before and after our entry into the war, reported several hundred vessels of different types as suitable for such service as patrolling, mine sweeping, towing, etc., and of those taken over, over 80 were designated as mine sweepers, and about 50 added to the list of tugs. Very few of them, however, possessed the characteristics which had been adopted as the most desirable for such service.

Two designs for mine sweepers were prepared, early in 1917, one for a 200-foot, 1,250-ton vessel of 16 knots speed, and the other for a 180-foot vessel of 950 tons and 14 knots, both designed along the lines of a modern seagoing tug, with a view of their utilization as such during the war, if necessary, and after the war might end. The advantage appeared to be with the smaller design, both as to time and expense of construction, ease of handling, etc., and the department on May 10, 1917, authorized the building of 14 of those vessels from the emergency fund. As it had just previously issued instructions for the construction of 10 seagoing tugs, it was decided to place orders for 24 vessels of the design referred to, the details of which were as follows:

Length over all, 188 feet 10 inches; length between perpendiculars, 180 feet; beam, 35 feet 6 inches; depth, 18 feet 8½ inches; draft, maximum, 10 feet 3¼ inches; displacement, normal, 950 tons; speed, 14 knots; horsepower, 1,400; propelling machinery, vertical 3 expansion; 19 by 29 by 46 feet; stroke, 30 inches; fuel, 275 tons oil; cruising radius at 10 knots, 6,000 knots; battery, two 3 inch .50-caliber AA; messing and berthing for 5 officers and 67 men.

The problem presented in placing contracts for a considerable number of steel vessels of this size was not simple in its solution, as a survey of the coun-

try's facilities had been made, the result of which indicated that all yards capable of undertaking such construction had their facilities obligated to capacity for the coming year. The Navy had, however, come to view such a condition as standard and one which called merely for the uncovering of other ways and means which in this case must be quickly found as the department had placed the mine sweepers on a par with the destroyers, the construction of which took precedence over all other types of ship construction.

As a first step in the interest of expeditious construction it was decided to develop all features, except those of a purely military nature, along the lines of commercial-ship construction, with the result that naval specifications were to give way to commercial practice, as stipulated by the American Bureau of Shipping, with the intention of building the vessels to the highest class under these rules. To further facilitate matters for those builders who were accustomed to build only to commercial standards, arrangements were made to have the detail plans prepared by a private concern with a long experience in tug design and construction. A later development in this direction provided for this same concern placing orders for all materials except those to be furnished to the contractors by the Government.

These arrangements made it possible to utilize facilities of builders who had not had experience in Government work and whose organizations ordinarily would not contain personnel capable of such work, but who were otherwise entirely competent to carry on the actual construction.

In view of the conditions at the time, bids were not solicited, as it was considered a more expeditious arrangement to call a conference of those contractors who had facilities which seemed to possess possibilities for mine-sweeper construction without undue interference with existing contracts for naval and merchant ship construction. As a result of this conference it was found possible to place contracts for the 24 vessels, which were accordingly awarded to eight contractors. The Harlan plant of the Bethlehem Shipbuilding Corporation accepted as their portion of the task a contract for the preparation of detail plans, the ordering of materials for all contractors, and the manufacture of all necessary patterns.

As a result of the diligent search which had been made for unused facilities, it became evident after the first award had been made for 24 vessels that more of this class could be constructed, which condition of affairs was promptly taken advantage of, and in July, 1917, the additional mine sweepers were ordered of three private yards and two assigned to the Puget Sound Navy Yard.

With 36 of these vessels placed, attention was directed to assisting the contractors to put their plants in such shape that construction might be started immediately upon the arrival of the first consignment of material. With but few exceptions it was necessary to add ways, tools, and handling devices and in some cases the reconstruction of an entire yard was required. Material orders were followed up, and by early fall materials were beginning to arrive in sufficient quantities to permit a real start in the way of construction.

The progress made at the outset was considered most gratifying, but a long period of winter weather set in which was most unusual in its severity and duration. In spite of these conditions, however, work at no time was completely suspended.

In January, 1918, it became apparent that the 36 mine sweepers already under construction would not prove sufficient for the needs in prospect, and it was accordingly necessary to arrange for the construction of an additional group of 18. Some few of the contractors had in the meantime made rather exceptional progress in the completion of their original contracts, and it was thought advisable to assign this new construction to them in order to take advantage of the experience their organization had obtained. Of these 18 vessels 14 were placed in private yards and the remaining 4 assigned to the navy yard, Philadelphia, thus providing for a total number of 54 mine sweepers, 5 being canceled eventually.

It had been expected that deliveries of the first completed mine sweepers might be made about February 1, 1918, but this was not accomplished until May 25, 1918, on which date the Todd Shipyard Corporation delivered the *Owl*, the first United States seagoing mine sweeper to be completed. This delivery took place but a few days before the commissioning of the *Kingfisher* at the Puget Sound Navy Yard. From this time on deliveries were made at rates varying from three to seven completed vessels each month.

All mine sweepers, with the exception of the *Kingfisher*, built at Puget Sound Navy Yard, were placed in service without the formality of the usual official

trials. In the case of the *Kingfisher*, a set of trials were held with most gratifying results. All requirements had been exceeded by a satisfactory margin, the only factor remaining unknown at the conclusion of the trials being the seaworthy qualities. About June 15, 1918, however, the *Kingfisher* sailed for Hampton Roads, and in extremely heavy weather which was encountered during the passage effectively demonstrated that the new class of mine sweepers would prove exceptional as regards their seaworthy qualities.

As the first mine sweepers became available they were pressed into service as seagoing tugs, for the need of this type of vessel was at the time great, indeed. As increasing numbers were completed they were promptly assigned to such service as most pressing needs dictated, but as events shaped themselves it was not until after hostilities had ceased that opportunity came to utilize these mine sweepers as such, in connection with the removal of the North Sea mine barrage, an undertaking which had lost none of its war-time hazards with the signing of the armistice and which was not completed until September, 1919. The first detachment dispatched for this duty included 18 of the new mine sweepers, which force was augmented from time to time until it comprised a total of 36 of this class of vessel.

As stated in the body of the narrative, the American Shipbuilding Co., of Cleveland, undertook, in the spring of 1917, the construction of two seagoing tugs, duplicating one of its earlier designs as represented by the *Piscataqua*, which had been purchased by the Navy in 1898 and had proven most satisfactory in service. These two tugs were named the *Allegheny* and *Sagamore*. Unfortunately they did not reach the Atlantic until after the opening of navigation in 1918.

When it became possible, in the spring of 1918, to place 25 additional ocean tugs, it was decided, in order to minimize delays, to duplicate the *Allegheny* and *Sagamore*, with a few minor changes, as they had been built to commercial standards, and detail plans were available. The characteristics are as follows:

Length over all, 156 feet 8 inches; length between perpendiculars, 149 feet 3½ inches; breadth, 30 feet; depth, 17 feet 6 inches; mean draft, 14 feet 7 inches; displacement, 1,000 tons; speed, 13 knots; propelling machinery, vertical triple-expansion, 31 by 33½ by 55½ by 42; indicated horsepower, 1,800; fuel, 260 tons, oil; cruising radius, at 10 knots, approximately 4,880 knots.

At the time instructions were received by the bureaus relative to arranging for the construction of 25 seagoing tugs, 40 smaller tugs for harbor use were required by the department. In view of the difficulty in placing further contracts for steel-hull construction, it was decided to construct these tugs of wood. This procedure presented the further advantage of being able to secure the most lively competition, as the field in wood construction for craft of small size had been intensively developed by the Bureau of Construction and Repair in the successful completion of a large number of submarine chasers.

In the development of the final design for these tugs the bureaus first investigated the various types of tug boats of this approximate size in commercial use. The design finally approved was developed with the idea of making the construction as simple as possible in order to reduce the time required for construction to a minimum. The "88-foot harbor tug," as these tugs were termed, embodied the following dimensions and characteristics:

Length, 88 feet; length between perpendiculars, 82 feet 2½ inches; breadth, 20 feet; depth, 10 feet 9 inches; mean draft, 8 feet 9 inches; displacement, 215 tons; indicated horsepower, 300; speed, 10 knots; fuel, 30 tons coal.

On May 21, 1918, bids were opened and, as was expected, a large number of bidders submitted proposals which insured competition and also the possibility of placing these contracts on a lump-sum basis. Contracts for 35 tugs were awarded to 13 private contractors, two tugs being ordered built at the Charleston Navy Yard and three at the New Orleans Naval Station. Work was started promptly, but it was apparent from the outset that serious delays would be occasioned in obtaining steel for the boilers. Deliveries in accordance with the contract delivery dates were to commence in the fall of 1918, but as anticipated, the delay in furnishing boilers interfered with this schedule and the first boat was not delivered until February, 1919.

Another project for tug construction was undertaken early in the year 1918, which was both interesting and profitable in the way of results obtained.

Officers in the Bureau of Construction and Repair, who had previously been assigned duty on the Pacific Coast, had closely observed a type of so-called "motor tug" which had been developed for commercial use and which seemed

to possess marked advantages as compared with steam-propelled tow boats of the smaller sizes. These commercial tugs ranged in length from 50 to 90 feet, the size in most general use being 65 to 70 feet. The advantages of this type of tow boat lay in the small crew required, usually three men, and the elimination, with the exception of crew hire, of standby charges. The propelling machinery consisted generally of an internal combustion engine of about 150 belt horsepower capable of burning distillate and so installed as to allow complete control by the helmsman in the pilot house, an arrangement which accounts for the very small crew required.

As the hulls were of wood and of small size the additional merits of quickness and cheapness of construction were possessed by this type of craft. These tugs were to be constructed for about \$30,000 each, in comparison with a cost of \$85,000 for steam tugs capable of doing apparently the same duty.

The desirability of determining the usefulness of this type of tug was at once recognized by the department, and after plans had been obtained the Mare Island Navy Yard was authorized, on April 29, 1918, to construct four of them with as much dispatch as possible.

By September the first of the four experimental motor tugs had been completed and found to be very satisfactory, with the result that on November 5, 1918, an order for 10 additional tugs of this type was placed with the Mare Island Yard. Two "65-foot motor tugs," as they came to be designated, were authorized for construction at the naval station, Pearl Harbor, in August, 1918, bringing the total of this type to 16, all of which have since been completed.

Schedules are appended showing distribution of contracts for mine sweepers, seagoing tugs, and 88-foot harbor tugs, with dates of keel laying and percentage of completion the beginning of November, 1918.

CONTRACTS FOR MINE SWEEPERS.

PRODUCTION OF SEAPLANES.

The bureau upon the entry of the United States into the war was not without experience in seaplane design and construction, and the theoretical and technical knowledge necessary to undertake the war program was, to a large extent, already available. Prior to 1916 no appropriations were made specifically for aircraft purposes, but funds were allotted by the department for aeronautical experiments as follows: 1912, \$25,000; 1913, \$10,000; 1914, \$10,000; 1915, \$10,000; and in 1916 the first appropriation was made for naval aeronautics in the sum of \$1,000,000. These funds had been spent in the construction of about 95 seaplanes for training purposes, and the establishment of the air station at Pensacola for the training of aviators and the testing of experimental seaplanes.

The first production order for seaplanes in the United States was placed in the fall of 1916 with the Curtiss Co. for 30 type N-9 training machines. Previously no satisfactory type had been developed and the preparations for war practically date from this order. By the spring of 1917 large classes of aviators were in training on these machines.

With the declaration of war the first requirement was for more training machines and the Curtiss Co. was given an order for 64 more N-9's and 76 of a larger type designated as R-6. These orders filled the available capacity of the Curtiss Co., which at that time had large orders for training airplanes from the Army and the British Government. To permit expansion of the training program, additional orders were placed with each of the six other aircraft manufacturers for sample training planes of their design. Several satisfactory types were submitted for test and orders were placed in the summer of 1917 as follows: Burgess Co., of Marblehead, 12 planes of Burgess design, plus 30 Curtiss N-9's; Boeing Co., of Seattle, 50 planes of Boeing design; Aeromarine Co., of Keyport, N. J., 200 planes of Willard design; Curtiss Co., of Buffalo, 15 training boats type "F" and 122 R-6's, both of Curtiss design. These orders were delivered at a satisfactory rate and the training of aviators was at no time held back for lack of satisfactory training planes. The fact that the bureau was able to proceed with confidence to produce these training seaplanes is due to the experience gained in 1916. A satisfactory type, N-9, had been developed by the Curtiss Co. in cooperation with the bureau, and it was not difficult to arrange for other firms to produce similar planes equal or superior to it.

The development of the N-9 was a fundamental without which the entire naval air effort would have broken down. Its conception was simple in the extreme. In the summer of 1916 there had been a succession of fatal accidents with the pusher seaplanes then in use and flying at Pensacola had

come to a standstill. The chief constructor sent for Mr. G. H. Curtiss and proposed to him that he take the existing Curtiss JN Army plane, place a pontoon under it, add a specified amount to the wing area to carry the extra weight, and add specified amounts to the tail areas to give stability. The result was the N-9, which proved the remedy for the accidents at the flying school.

With the training program well under way, it remained to determine what part naval aircraft would play in the war and to provide the necessary material. At first it was not known whether the Navy would send aircraft abroad at all, but it was decided by September, 1917, that the Navy should operate 15 seaplane stations on the coasts of France and Ireland from which seaplanes would patrol the submarine-infested coastal waters through which American troop and supply ships were to pass.

Attempts were made to obtain information from abroad of any successful types in order that their manufacture might be undertaken, and in July, 1917, a board of officers was sent to England, France, and Italy, to obtain this information at first hand. This board on its return, September 1, 1917, reported that there was no wholly satisfactory foreign seaplane suitable for coastal patrol; that foreign development had concentrated on the production of land machines, and that American types equipped with the new Liberty engine would be superior to any abroad. The Joint Army and Navy Technical Board, acting upon this information, and with the knowledge that 15 coastal air stations abroad would be operated by the United States Navy, prepared a building program which was approved by the Secretary in October, 1917.

This initial program provided for the first equipment of stations abroad, advanced training in this country, and replacements for the period of a year, and included 1,185 single Liberty-engine flying boats (HS-1) and 235 twin Liberty-engine flying boats (H-16); two types only, and both American designs (Curtiss). Among reasons for this policy were (a) the engine had been demonstrated to be satisfactory; (b) these flying boats had been demonstrated to be superior to any others; (c) provision of but two types with a single type of engine simplified production and maintenance; (d) two types of flying boats were necessary as the large boats could not be constructed in sufficient quantities, involved shipping difficulties, and drew too much water for use on certain of the French stations.

Again, as in the case of the training planes, the bureau was well prepared in the technical sense and could proceed with confidence to quantity production without much time lost in experiment. The problem was, of course, simplified by the requirement of but two types.

The HS-1 was developed from a Curtiss design known as H-14, which was brought out in the summer of 1917 with twin 100-horsepower engines. It was too heavy for the power and was a failure. The Curtiss Co. then replaced the twin 100-horsepower engines by a single 200 horsepower-engine. The boat then performed much better and while still underpowered, gave considerable promise. The bureau was in close touch with this development and when the Liberty engine seemed to be successfully tested on the bench, arranged to have one of the experimental engines assigned to try in an HS boat. A contract was made with Curtiss to install this engine and on October 21, 1917, successful trials were held over Lake Erie, at Buffalo. This was the first time a Liberty engine was put into the air. There had been a friendly race with the Army to see which service would first make use of this remarkable new engine.

The boat was pronounced successful by a naval trial board, and arrangements made for its production by the Curtiss Co. to the limit of its capacity. In order to provide additional units, the department purchased for \$50,000 the unlimited production rights from the Curtiss Co. and placed orders with five other concerns to build HS boats to Curtiss plans.

The first model, known by the type symbol HS-1, was a typical Curtiss type of flying boat, having a length of 38 feet and a wing span of 62 feet. The gross weight in the air of 5,900 pounds included a crew of two men, one machine gun, and two 180-pound bombs. The maximum speed of 87 miles could be maintained for four hours. After production had got well under way, information was obtained that the 180-pound bomb was not really effective against submarines and heavier bombs, as well as a radio outfit, would be needed. Obviously, the extra could be carried only if the fuel supply were cut down, which was not advisable. The solution was found in an increase in the wing area of the boat, by which a greater load could be carried in the air. The bureau

designed a 6-foot wing panel to be inserted outboard of the engine section on each side and a larger rudder, which could be supplied to the HS-1 boats, converting them to model HS-2 without further change. This increased the span to 74 feet and permitted a total weight of 6,500 pounds. The radio, two 230-pound bombs, machine gun, and two pilots were carried with ease, and, furthermore, the endurance was increased to 4.4 hours at full speed and 6.5 hours at cruising speed. The full speed was only reduced 2 miles per hour by this change in design, which at once gave us a vastly improved machine without interference with production. It is believed this is a unique example of a fundamental design change which did not cause as much trouble as benefit.

The production of HS-2 boats is summarized in the following table:

	Number ordered.	Shipped abroad.	Delivered.	Canceled after armistice.
Curtiss A. & M. Corporation, Buffalo, N. Y.	674	213	674
L. W. F. Engineering Co., College Point, L. I.	300	10	250	50
Standard Aircraft Co., Elizabeth, N. J.	150	6	80	70
Gallaudet Aircraft Corporation, East Greenwich, R. I.	60	60
Boeing Airplane Co., Seattle, Wash.	50	25	25
Loughead Co., Los Angeles, Calif.	2	2
Total	1,236	229	1,091	145

With these concerns the following yacht-building firms worked as subcontractors for the boat hulls: College Point Boat Co., College Point, N. Y.; Geo. Lawley & Sons, Neponset, Mass.; Unit Construction Co., Philadelphia, Pa.; Mathis Yacht Building Co., Camden, N. J.; L. E. Fry & Co., Clayton, N. Y.; Palmer-Simpson Co., Saranac Lake, N. Y.; Mathews Boat Co., Milwaukee, Wis.; Fay & Bowen Engine Co., Geneva, N. Y.; Niagara Boat Co., Tonawanda, N. Y.

The other type adopted for production by the Joint Army and Navy Technical Board was the H-16, to be fitted with twin Liberty engines of 400 horsepower each. This type had been developed during 1915 and 1916 by the Curtiss Co. and the British Admiralty. The original model had been the Curtiss *America* of 1914, built for a proposed trans-Atlantic attempt. The *America* was not successful, because no high-power engines were available, but the British Admiralty ordered a number of them and fitted them in England with two French Anzani engines of about 100 horsepower each, known as "small America's," and they were used to patrol submarine areas. Curtiss then designed the H-12, a larger machine on the same lines, which was fitted in England by the Admiralty with twin Rolls-Royce engines. The Admiralty redesigned the hull of the H-12 to provide greater strength and introduced for the first time the steep Vee bottom, with double steps. The Curtiss Co. was given, in 1917, a large order for the British redesigned boat, known in England as F-3, or "Large America," and in the United States as H-16. This machine was already in production at the Buffalo works of the Curtiss Co., but the design was arranged to mount Rolls-Royce engines. It became necessary to redesign extensively to provide for Liberty engines. As engines were installed in England, none of the H-16's had ever been completed or flown in the United States.

The redesign of the H-16 to take the Liberty engine necessarily involved extensive changes, but there was no time to work out a trial installation. Production was started at once, and by a combination of good luck and good management no serious difficulties developed. It should be remembered that the engine is the heart of a flying machine, and a complete change of power plant involves in addition to extensive structural revisions alterations in balance and stability.

The H-16 is a biplane flying boat 46 feet long with wings of 95 feet span. The twin Liberty engines develop 360 horsepower each (if low compression) or 400 horsepower (if high compression). The weight empty is 7,400 pounds and loaded 10,900 pounds. The useful load includes four men, radio, two 230-pound depth bombs, and four machine guns. The maximum speed is 95 miles. At this speed the endurance is four hours, but patrols at cruising speed of nine hours were made in the war zone.

During 1917 the British Admiralty redesigned the *H-16* again to produce a boat to carry more depth bombs and to have greater endurance. A sample machine was successfully developed in the spring of 1918 and plans sent to the United States. In this case the change to get greater load capacity was not at all like the *HS-1*, *HS-2* change noted above, but an entirely new design down to the last bolt. The new type *F-5* had an allowable full load of 13,000 pounds and could carry four depth bombs against two for the *H-16*, besides having a cruising endurance of 11 hours against 9 for the *H-16*. The maximum speed was about 7 miles less.

The advantages of the new type were obvious, and during 1918, as the *H-16* contracts were completed, orders for type *F-5* were placed with the same concerns. It should be noted that the British plans for the *F-5* were taken from a sample machine and were in no way production plans. Also the details of construction were impossible for quantity manufacture and the design provided for Rolls-Royce engines. The machine was completely redesigned at the naval aircraft factory to adapt it for quantity production on the assembly system, to use American standard parts and practices, and to install twin Liberty engines.

The production of *H-12*'s, *H-16*'s, and *F-5*'s is summarized in the following table:

	Ordered.		Delivered.	Shipped abroad.	Canceled after armistice.
	Number.	Biplanes.			
Curtiss A. & M. Corporation, Buffalo, N. Y.....	19	H-12....	19
	74	H-16....	74	62
	410	F-5....	60	350
Curtiss Engineering Corporation, Garden City, L. I..	50	H-16....	50	18
Naval Aircraft Factory, Philadelphia.....	150	H-16....	150	78
	680	F-5....	137	543
Canadian Aeroplanes (Ltd.), Toronto, Canada.....	50	F-5....	30	1	20
Total.....	1,433	520	150	913

In December, 1917, the naval aviation forces operating abroad, in conjunction with the British Admiralty, had found the twin-engine flying boat (the *Large America* of the Royal Naval Air Service) a very superior fighting craft, and, following recommendations by Admiral Sims, a greatly increased program, calling for a total of 864 of the twin-engine flying boats was authorized on December 26, 1917, for delivery by the spring of 1919. That added 629 boats to the program of 235 of October, 1917. The firms then manufacturing naval aircraft could not handle any larger orders. In those plants there were on order for the department 19 *H-12*'s, which were suitable for training but not for patrol, and 134 *H-16*'s for delivery in the first six months of 1918. The Curtiss plant at Buffalo could deliver 150 and the naval aircraft factory 100 units. That left 480 boats to be secured from some new source, to be organized from the ground up. How was the situation to be met? Allowing three months for building a new plant and one month for equipping and organizing, work might start in four months, and deliveries begin before six months had elapsed. After the labor and material were assembled the capacity of the plant must be about 90 boats per month. Such a project would have required a very large plant, doing a gross business of approximately \$36,000,000 per annum, exclusive of engines, and its creation appeared impossible in the time available. Accordingly, after careful study, a plan was worked out for coordinating existing yacht yards, as well as metal and wood-working shops, in manufacturing hulls, panels, and parts for delivery to a central organization in the nature of a great storehouse or progressive assembly plant. It was not practicable, because of the financial aspect, to get a private manufacturer to provide this large assembly plant, and since the plant must be built by the Government, it was obvious that it should be built as an addition to the existing naval aircraft factory. The extension was approved by the Secretary on February 9, 1918, and construction began at once.

Production in appreciable quantities was first reached in April, 1918. *HS-1*'s were being delivered at the rate of 6 per week and *H-16*'s at the rate of 3 per week, and these rates were constantly increasing, when, in June, the program

was again augmented, for delivery by the summer of 1919, by 700 F 5's, 300 HS-2's, 300 F boats and 200 N-9's. In September this was increased by 100 F boats.

By the summer of 1918 aircraft production was well under way and had reached its height about September 1, when deliveries were being made on twin Liberty engine flying boats at the rate of 13 per week, from the Naval Aircraft Factory, Philadelphia, Pa.; the Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y.; the Curtiss Engineering Corporation, Garden City, N. Y.; and the Canadian Aeroplanes (Ltd.), Toronto, Canada. Single Liberty engine flying boats were being delivered at the rate of 38 per week, from the Curtiss Aeroplane & Motor Corporation, Buffalo; the L. W. F. Engineering Co. (Inc.), College Point, Long Island; the Standard Aircraft Corporation, Elizabeth, N. J.; and Gallaudet Aircraft Corporation, East Greenwich, R. I. School or training machines were being delivered at the rate of 32 per week, from the Burgess Co., Marblehead, Mass.; and the Aeromarine Plane & Motor Corporation, Garden City, N. Y.

Hulls for the naval aircraft factory's production, and also for a number of the above-mentioned private concerns, were being constructed by the Herreshoff Manufacturing Co., Bristol, R. I.; Robert Jacobs, City Island, N. Y.; Geo. Lawley & Sons Corporation, Neponset, Mass.; L. E. Frye Co., Clayton, N. Y.; Mathews Boat Co., Port Clinton, N. Y.; Unit Construction Co., Philadelphia, Pa.; Mathis Yacht Building Co., Camden, N. J.; Chas. L. Seabury Co. and the Gas Engine & Power Co., Morris Heights, N. Y.; Niagara Boat Co., Tonawanda, N. Y.; Albany Boat Co., Albany, N. Y.; H. B. Nevins, City Island, N. Y.; Murray & Tregurtha Co., Boston, Mass.; Palmer Cimpson Co., Saranac Lake, N. Y.; College Point Co., New York; and a large number of wings, tail surfaces, and metal fittings were being manufactured by the Curtiss Aeroplane & Motors (Ltd.), Toronto; the Victor Talking Machine Co., Camden, N. J.; and Lock & Co., New York City.

In the fall of 1918, however, it was found that aircraft were being manufactured at a rate in excess of that required both for training and for service abroad, and the program was reduced early in November by 550 F-5's, 248 HS-2's, and 300 school or training machines. As soon as the armistice was signed the rate of production was slowed down as rapidly as possible and cancellation on outstanding orders was effected which further reduced the program by 145 HS-2's, 512 F-5's, and 100 school machines. In completing the few remaining units, the manufacturers were able to liquidate their large labor force and the industry was gradually reduced to a peace basis.

The construction of machines under this program was allotted to manufacturers already experienced in the art of airplane construction, as it did not appear wise to place orders with inexperienced concerns or to promise them orders which might drain raw materials already scarce and skilled labor from the established builders who were being pressed to expedite delivery. Many offers of facilities from manufacturers who had not previously built aircraft, and also from inexperienced aircraft concerns, were received by the bureau, and in every case hearing was given and careful investigation made. It was necessary in all production matters to cooperate closely with the Army by direct conference and all especially important matters were submitted to the Aircraft Board for approval and coordination. This arrangement worked well and eliminated competition and duplicate efforts.

Before placing the larger contracts prices and terms were submitted to the Aircraft Board for approval, although final approval was, of course, in the hands of the Secretary of the Navy.

At first school planes were purchased on a flat price basis, but when the large production contracts for the large service planes were wanted it was impossible to fix a fair price due to a complete lack of experience in building these types in the quantity contemplated. Furthermore, the material markets were becoming demoralized and there was no means of predicting future developments. The straight "cost-plus" contract was objectionable on many grounds, and a form of contract was evolved with the assistance of the Aircraft Board which provided for paying the contractor actual cost, plus a fixed profit of 15 per cent on an agreed on estimated or "bogey" price, plus one-quarter of any difference or saving the contractor might make under such "bogey." This form of contract was in the main very satisfactory and was used until late in 1918, when the mandatory "Navy order" was put in effect. The latter was less satisfactory as it did not contain the incentive to beat "bogey" and involved equally elaborate accounting system.

The Aircraft Board assigned the following aircraft manufacturers to accept orders from the Navy only: Aeromarine Plane & Motor Co., Keyport, N. J.; Burgess Co., Marblehead, Mass.; Victor Talking Machine Co., Camden, N. J.; Boeing Airplane Co., Seattle, Wash.; Curtiss Engineering Corporation, Garden City, Long Island, N. Y.; Gallaudet Aircraft Corporation, East Greenwich, R. I.; Canadian Aeroplanes (Ltd.), Toronto, Canada; L. W. F. Engineering Corporation, College Point, Long Island, N. Y.; Curtiss Aeroplane Co., Toronto, Canada; and assigned a fraction of the capacity of Curtiss Aeroplane & Motor Co., Buffalo, N. Y.; Standard Aircraft Corporation, Elizabeth, N. J. The other plants in the country were assigned to the Army.

The producing capacity so assigned was adequate to meet the Navy's requirements, and by September, 1918, production was in excess of requirements, all air stations at home and abroad had a full complement of seaplanes and shipments abroad were stopped temporarily. The armistice intervened before shipments had to be resumed.

In December, 1917, when manufacturers started building naval aircraft on a production basis, it was seen that it would be impossible to secure in the open market various materials, such as spruce, fabric, tape, dope, veneer, and steel tubing; and it became clear that the supply of them must be controlled by the Government. Of such materials the most difficult to obtain appeared to be spruce. The War Department was just starting its development of Sitka spruce on the Pacific coast, and the Navy was unable to secure definite assurance that Navy contractors would receive a quantity sufficient to meet its needs. A considerable portion of the New England spruce output had been found suitable for airplane construction before the war; had, in fact, been purchased by Germany for that purpose; but at this time was apparently being overlooked. As the emergency for spruce became acute, it was deemed advisable to determine if suitable material could not be secured from the New England woods, and an officer from the Bureau of Construction and Repair was sent to investigate. Early in January, 1918, he reported that approximately 1,000,000 feet per month of spruce, suitable for aircraft construction, could be secured from New England sources, at prices ranging from \$90 per thousand feet to \$125 for various lengths, and an agreement was reached with the Army whereby the Navy was to have the exclusive right to develop that territory.

The Navy Department then established an office in Boston, Mass., so as to keep in close touch with the New England spruce-producing mills, to secure information, to arrange contracts, and in other ways to safeguard an adequate supply of airplane spruce, the policy settled upon being a decision to use the New England lumber as a reserve stock in the event that the War Department should be unable to furnish Navy contractors with the required amount of Sitka spruce.

From February to May, 1918, about 1,000,000 feet of New England spruce was produced each month, but from June to October that quantity was reduced, as the need was not so urgent. From January to May, 1918, deliveries of Pacific coast spruce were not coming through in a satisfactory manner, and an effort was made to use the New England wood. However, owing to the fact that much of it contained small pine knots and was in shorter lengths than the Pacific coast spruce, contractors were reluctant to use it, and, in fact, its use was difficult under the interpretation of the specifications existing at that time. Accordingly, during May and June, 1918, detailed specifications were issued so as to allow the use of the type of spruce coming from New England, and in August, 1918, manufacturers of school seaplanes were required to build wooden part of laminated and spliced construction, and hence a larger quantity of New England spruce was used.

By May, 1918, about 70 New England mills were turning out spruce suitable for airplanes, and it became apparent that the production was greater than the needs of the Navy. Accordingly, efforts were made to dispose of the excess, various allied Governments were approached on the subject, and the Navy was successful in arranging a contract for 1,000,000 feet with the British war mission. When the first shipments reached England the British war mission to this country was notified that the material was satisfactory and was authorized to procure a further amount. Accordingly, shipments were then made to the British at the rate of approximately 500,000 feet per month under that contract and under a subsequent one calling for 3,000,000 feet.

Early in July, 1918, the War Department began to run short of strut material, and the Navy was asked to furnish various quantities to manufacturers of airplanes for the Army. In compliance with that request, New England spruce was supplied to the Sturtevant Aircraft Corporation, the Metz Co., the Wilson Body Co., the Packard Motor Car Co., and the Engle Aircraft Co., all contractors to the Army, the larger part of this material being strut stock suitable for the manufacture of De Havilland and JN-4 struts. The Army contractors first accepted it hesitatingly, as many were dubious about the use of material containing pin knots, but as soon as it was found that it worked as well, if not better, than Sitka spruce the Navy was in receipt of insistent orders from those same manufacturers for a further supply, and up until the signing of the armistice the Navy supplied them approximately 1,000,000 feet.

Soon after the shipment of spruce to the British began to go forward it was determined that it would be necessary to dry spruce down to a point that would permit its being shipped abroad in confined quarters. In order that the necessary drying could be accomplished under the control of a Navy inspector, it was found advisable to secure a yard where that material and material for the Army and the Navy contractor could be selected and sorted out. A yard at the foot of Southampton Street, Boston, Mass., was selected and secured at a nominal rental—\$4,000 per year—and stocks of New England spruce were built up, nearly 6,000,000 feet of lumber being handled there.

When orders were placed for Sitka spruce prices ranged as high as \$350 per thousand feet b. m. In October, 1918, however, A-grade spruce was charged at \$642 per thousand, and the Navy was informed that it was the intention of the War Department to amortize in a period of 10 months its entire Pacific coast lumbering establishment, cut-up plant, railroads, etc., and that it was necessary to charge those prices to absorb that overhead.

While many of the mills on the Pacific coast were cutting spruce for the Army's cut-up plant, there were a few small mills, not considered by the War Department, which had a small output of Sitka spruce. This stock was sold to various New England mills holding Navy contracts, and Sitka spruce was shipped in from the West over the Canadian Pacific Railroad, sorted in New England, selected by Navy inspectors, and purchased at the same prices paid for New England spruce, viz., \$125, \$110, and \$100 per thousand feet for A, B, and C grades. This material was found to be just as satisfactory as that stock supplied by the Army at \$642, \$350, and \$160 per thousand for A, B, and C grades, respectively.

The Army's airplane program required a tremendous quantity of airplane wing covering fabric, and it was thought best to pool the interests of the Army and the Navy in securing it. Accordingly, the control of the mills capable of producing this material was centralized in the Army, with the understanding that the Navy requirements would be taken care of. At no time during the active production period of the Navy seaplanes was there any great shortage in fabric or tape; but when a slight shortage did exist every effort was made by the Army to keep Navy contractors supplied.

The manner in which fabric was supplied was at all times very satisfactory, and shipments in many instances were made within 24 hours after the receipt of the Navy's request.

As the Navy's program grew it was found that a larger quantity of acetate dope than was first anticipated would be required. At the same time there was a shortage of cellulose acetate, and it was therefore decided that the control of that necessary product should be centralized in the War Department, as had been done with tape and fabric. From January until July, 1918, however, there was no difficulty in securing sufficient acetate dope to meet the Navy's needs, due largely to the fact that the Army's airplane production had not yet reached any large volume. In July Army production increased greatly, and there was considerable difficulty for both Army and Navy in securing the required amount of acetate dope, but at no time was Navy production held up for the lack of acetate dope.

Nitrate dope was secured by the Navy from the Du Pont Co., but owing to the shortage of nitrates the War Industries Board was reluctant to release the necessary raw materials. However, by ordering merely enough to satisfy immediate needs, maintaining low stocks, and watching them very carefully the bureau was able to secure sufficient nitrate dope.

From May to October, 1918, it was found that some materials were running short, especially tubing and waterproof plywood. While it was unnecessary in

many instances to purchase those materials for Navy seaplane contractors, it was necessary for the Navy to help seaplane contractors secure them, as production could be held because of the lack of any one. Many delays in delivery of materials were brought about by improper handling of priorities certificates by contractors, but Navy inspectors at contractors' works soon found the proper method of securing quick deliveries of materials through the departments' co-operation and, except in rare instances, little difficulty was experienced in securing adequate stocks to maintain production at contractors' plants at all times.

During 1918 several new types of seaplanes were constructed for the Navy Department, and trials were conducted to determine their suitability for special service, either as training or as service machines. The order for each of these seaplanes was placed with the definite purpose of development of some particular need in the future program, if the war had continued.

With reference to training machines of the flying-boat type the Curtiss model F had proved itself the most satisfactory in use, but it was desired to develop a machine of better structural character along the same lines. Encouraged by the Navy Department the Aeromarine Plane & Motor Co., developed its model 40-A and the Curtiss Engineering Corporation its MF (modified F) boat, both of which were recommended for adoption by the trial board and for which contracts were awarded.

Several service machines of particular interest, some of which presented a distinct advance in airplane design, were constructed and tried out in the summer and fall of 1918. Of these the most important are the NC-1, the Curtiss model 18-T, or Kirkham fighter, the HA, and Gallaudet or D-4.

The NC-1 is a large flying boat, built by the Curtiss Engineering Corporation, under the direction of certain officers of the Bureau of Construction and Repair who were responsible for the design. It is a biplane, and has a spread of 126 feet for the upper wing, and a length of 68½ feet from the bow to the end of the tail surfaces. The weight, fully loaded, is 22,000 pounds, the bare machine weighing 13,000 pounds. It is equipped with three Liberty engines, each located in a nacelle between the wings. Of particular note is the hull, which somewhat resembles a large pontoon in appearance, and which has proved especially efficient in planing and get-aways. The NC-1 is the machine which made a flight at Rockaway, N. Y., on November 27, 1918, with 51 men aboard, thereby establishing the world's record for passengers carried.

After the armistice four NC boats were fitted with four Liberty engines for the trans-Atlantic flight.

The Curtiss model 18-T, or Kirkham fighter, is a land machine, designed and constructed for the Navy Department by the Curtiss Engineering Corporation and intended for the protection of those bombing squadrons along the coast of France which required extremely fast machines. It is a triplane of 32-foot wing spread and has 2,800 pounds weight when loaded. It is equipped with a Curtiss (K-12) engine, a new type engine which was used for the first time in this machine. The Curtiss 18-T made 162 miles an hour, a world's record. It carried two men, two synchronized guns forward, and two Lewis guns in the rear cockpit.

The HA is a single-pontoon seaplane, equipped with one Liberty engine, constructed by the Curtiss Engineering Corporation for the Navy. It has a wing spread of 36 feet. This is a two-seater machine, equipped with two synchronized machine guns forward, and two Lewis guns in the rear cockpit. Its maximum speed of 125 miles per hour is a remarkable performance for a seaplane.

The Gallaudet D-4 is a two-seater seaplane with a single Liberty engine driving a propeller by means of a ring gear mounted on the fuselage aft of the wings. The machine is designed as a fighter, and with 2 men and 434 pounds of machine guns and bombs made 119 miles per hour. At this speed the endurance is 2.5 hours. The design is distinctly novel in that it gives excellent view and field fire forward.

DESIGN AND CONSTRUCTION OF THE NC FLYING BOATS.

In June, 1917, due to the lack of any conclusive information regarding the work of the allied Governments and to varied and contradictory recommendations which had been received from the War Department and the Admiralties of Great Britain and France as to the types of planes which should be adopted

by this country, an informal joint Army and Navy board was appointed to proceed to Europe and to make a study of the air matters among the principal Governments engaged in the war against Germany, and to recommend the steps to be taken by our Government in building up its own air services and in carrying out a definite air policy.

The personnel of this committee was Maj. R. C. Bolling, Capt. V. E. Clark, Capt. E. S. Gorrell, Capt. Howard Marmon, and Capt. Hughes representing the Army, and Lieut. W. G. Childs and Commander G. C. Westervelt representing the Navy. In accordance with instructions to the committee, they proceeded to Europe, arriving in London the latter part of June. At this time the naval activities of the United States Government were directed mainly against the submarines. The center of naval activities was the American Embassy in London, and by this time the naval officers had become keenly aware of the grave menace of the German submarines. At the embassy all discussions centered around this subject, and it was evident that fuller methods of combating the submarine must be provided and provided very quickly. Accordingly, there began a particular and detailed study of the types of aircraft for use against the submarine menace. This study was carried on in England, in France, and in Italy, and, as a result of this study, it was concluded that the quickest way for the Navy to obtain results in the air would be with kite balloons, for observation purposes, anchored to a destroyer or some other type of patrol vessel, and with seaplanes of the flying-boat type, as differentiated from the hydroaeroplane, for patrol purposes and for the bombing of submarines.

At this time the largest flying boat in use for patrol work was the *H-12*, a craft equipped with two Rolls-Royce motors, with a lifting capacity of approximately 9,000 pounds, and a cruising radius of slightly over 500 miles. This type of boat had proved successful in patrol work, except for its limited cruising radius. Because of the fact that the regions in which submarines were active were often a considerable distance from the naval air base, the entire time available for patrol was often used in flying to and from a base. It was very desirable that larger craft should be provided—craft which could not only carry a heavy load of bombs but which also had sufficient radius of flight for the trip from the naval bases to the patrol regions and return.

The commission mentioned above returned to this country in the latter part of August, 1917. When the report with its recommendations had been presented, it was decided by the chief of bureau to go much farther, having in view design of a boat able to fly itself, if necessary and possible, across the ocean, with capacity to proceed before daylight from the base to the patrol area, to spend the day in patrol work or in convoy, and to return to its base after dark; in addition to this, to be able to carry several bombs of a size to increase very materially the danger zone in the bombing of submarines. This decision was made notwithstanding all information available regarding the design and construction of flying boats of great size indicated the enormous difficulty of such a project. The trend of opinion of the European air ministries was against such large sizes, and, as far as the methods of construction and the motor powers available at that time were concerned, the limit of size was generally believed to have been practically reached.

This was the inception of the design of the NC type of flying boats. After some further consideration, it was decided to call upon Mr. Glenn Curtiss, at that time the American most experienced in the design and construction of seaplanes, for his suggestions as to the type of seaplane which might best fulfill the requirements. Mr. Curtiss came to Washington, and, after a conference, it was decided to investigate the possibilities of a seaplane capable of sustained flight from Newfoundland to Ireland, if possible, or at least capable of flight from Newfoundland to the Azores. Certain definite conclusions reached by the bureau regarding the probable type of such a seaplane were given Mr. Curtiss for his examination.

Within a few days after this conference Mr. Curtiss returned to Washington with preliminary plans for two types of flying boats embodying in their general characteristics the conclusions of the bureau—one a five-motor, 1,700-horsepower machine, and the other a three-motor, 100-horsepower machine. Both were biplanes, similar in design, and differing only in size, this being dependent upon the available horsepower. The hulls of these machines differed greatly from conventional design. They were much shorter than the conventional boat hull, were shaped more like the pontoon of a seaplane, and with the intention

that the tail surfaces, instead of being supported by the hull, would be carried by a system of outriggers in part from the upper wing beams and in part from the stern of the hull. These suggestions covered rough sketches only of the proposed machines, together with certain estimates based on extensive experience as to weights and sizes. Following a thorough discussion of the matter it was decided not to attempt the construction of the large size of 1,700 horsepower but to develop a smaller one of approximately 1,000-horsepower.

In taking up the design of such seaplane, it was very evident that radical changes in the method of design must be followed. With the methods of design at the time almost generally employed the limits of size had been practically reached. The largest machine at that time in use was the Handley-Page night bomber. In the design of this airplane new and advanced methods had been employed, and to its study much consideration was given. This machine had a total lifting capacity of 11,000 pounds and was equipped with two 275-horsepower Rolls-Royce motors. The deadweight was approximately 6,600 pounds, and the allowable weight for oil, gasoline, cooling water, crew, and miscellaneous supplies, which grouped together and called by the name of "useful load," was 4,400 pounds. This made the value of the useful load 40 per cent of the gross load, which was the maximum percentage which had been obtained in any large machine. Naval Constructor Hunsaker in estimates which had been made of various planes of an average lifting capacity of 2,500 pounds had found that the percentage useful load was from 30 to 32 per cent. The proposed design for the 1,000-horsepower flying boats called for a total load of approximately 25,000 pounds. In comparing this machine with the Handley-Page night bomber it was apparent that the design of the Handley-Page would have to be improved upon and the percentage of the useful load made at least as high if this design was to be considered successful. One possibility of improvement of the design was in the use of the Liberty motor, which was at that time undergoing its first tests and which gave promise of being lighter for its power than any other motor then in use.

It has been found that in the construction of airplanes and seaplanes certain unescapable deadweights, such as engines, propellers, radiators, gasoline and oil tanks, crew, etc., must be allowed for. The total weight of the machine will be, roughly, from three to four times the sum of these deadweights. If in any manner, such, for example, as by a reduction of the weight per horsepower of the motor, 100 pounds can be saved in the weight of any of these parts there will be a reduction in the total weight of the machine of from 300 to 400 pounds with a considerable increase in the weight of gasoline which can be carried. There were also possibilities of reduction in the weight of structural elements, such as wing beams, ribs, wing struts, compression struts, fittings, etc. If by any method of design it were possible to reduce the weights of these parts without reducing their strength there would again be a gain in the fuel-carrying capacity of the machine over that possible with methods of construction at that time in use.

The points outlined above give some idea of the problem of design which it would have been necessary for the Bureau of Construction and Repair to handle in the preparation of plans for this boat. Because of the insufficient technical force at the bureau and the difficulty in increasing this force it was decided that the best method of procedure would be to transfer the physical work of the design of this machine to the Curtiss Aeroplane & Motor Corporation, at Buffalo. The Curtiss Aeroplane & Motor Corporation was the only aeronautical manufacturing company which had a well-organized design force in any way capable of handling this problem. On the transfer of this design to the Curtiss organization, it was intended that the Navy would exercise close control over the design, and that the Curtiss organization should work out all details under Navy supervision.

When plans for the design had been carried this far it became necessary to obtain the cooperation of the other bureaus which would be concerned in the construction of such a craft and to obtain the approval of the Secretary of the Navy. The Division of Operations and the Bureau of Steam Engineering agreed to the carrying out of these plans, and the entire proposition was then submitted to the Secretary of the Navy. The Secretary approved the proposal which had been made, and it was then possible to proceed upon the definite work of design. Accordingly, a contract was made with the Curtiss Aeroplane & Motor Corporation on the basis of cost plus a fixed profit on the determined cost. Such a contract was necessary because no design similar in nature to this had even been attempted, and there were no figures available which could

give even an approximate estimate of the cost of such a design. The contract as arranged provided that all labor and material should be charged directly to the contract. To this charge 100 per cent would be added to cover intangible and indirect expenses which could not be definitely estimated, and to the sum of these two amounts 10 per cent was to be added for profit. This proposed contract was satisfactory to both the Navy and the Curtiss Aeroplane & Motor Corporation, and work was started upon the design early in October, 1917. The design work was later transferred to the Curtiss Engineering Corporation, at Garden City, Long Island, where it was completed in January, 1918.

At this time it became necessary to choose a name for this type of flying boat. Inasmuch as the design work was under the supervision of the Navy but was being carried out by the Curtiss organization, it was decided that the name of the type would be the NC-1, N standing for Navy and C for Curtiss, and the 1 representing the first boat designed under this arrangement between the Navy and the Curtiss Co. It was intended calling specific boats of this type NC-1 No. 1, NC-1 No. 2, etc., but as this has proven awkward in use the type is now known as the NC type, and the specific boats as the *NC-1*, *NC-2*, etc.

The method usually followed until a year or two ago in the production of new types of flying boats, and for new types of airplanes in general, had been to make sketches of the proposed type of plane and of some of the more important elements and details, estimate the probable weight, and then to proceed immediately upon the construction of parts. If the completed machine did not give satisfactory operating characteristics, certain parts would be changed and it would be tried again. This method would be continued until the design proved to be entirely unsuited for practical use or some satisfactory compromise was reached. With such an unscientific method of design it is exceedingly difficult to determine why a plan fails to come up to the estimated performance. If the weights are excessive, it is difficult, or even impossible to determine wherein the excess lies, or how to change the construction to make a reduction. If the speed of the machine fails to come up to expectations it is practically impossible to determine what changes can be made.

In the design discussed, due to the great increase in size over any successful boat previously constructed, and to the necessity of increasing the percentage of useful load above any which had been reached in flying boats, the adoption of the method of procedure as outlined above would have made failure certain. It was determined to have every detail designed carefully, according to the best engineering practice, and to have the design practically completed before any construction work was commenced. It was only in this way that it would be possible to arrive at a design which would give a practical certainty of a flying boat coming up to the requirements laid down, or which failing in this would show definitely and exactly to what failure was due.

The original plans discussed with the representatives of the Curtiss organization, called for the design of a flying boat capable, if possible, of sustained flight from Newfoundland to Ireland. As soon as the design had progressed far enough, accurate calculations of weights and resistance were made. Upon the completion of these calculations it was found that although the total weight came within the specified limits of 25,000 pounds, the total resistance was so high that, with the horsepower available, the speed would be cut down to such a low value that the estimated cruising radius instead of being the 2,000 miles required for going from Newfoundland to Ireland, would be not more than 1,300 miles. There seemed to be no possible way by which the amount of this resistance could be reduced and, because of this fact, the design of a flying boat, capable of flying from Newfoundland to Ireland, had to be abandoned as impracticable, temporarily at least. The design was now taken up on the basis of a total weight of 22,000 pounds and a cruising radius of 1,300 miles.

It would have been possible at this time to take up in detail calculations for a five-motored flying boat, as previously suggested by Mr. Curtiss. Difficulties which had been met with in the design of the three-motored craft had shown, however, that the original decision regarding size and horsepower had been wisely made, and that it was better to continue the work with the three-motored type of craft, even though its cruising radius were limited to 1,300 miles.

It was necessary to carry on a considerable number of very complete investigations to determine the sizes and shapes of parts to be used in the construction and the materials of which these parts should be made. These investigations had to do with the choice of wing beams, wing struts, wing ribs, compression

struts, metal fittings, outriggers for the tail support, and various other parts to be used in the construction of the hull and tail surfaces.

The NC type of hull, with the tail surfaces carried on outriggers supported in part from the upper rear wing beam and in part from the hull sternpost, was suggested by Mr. Curtiss in his original proposal. The details of the hull design are largely the work of Commander H. C. Richardson, of the Construction Corps. Commander Richardson had had a very wide experience in the design and testing of pontoons for seaplanes and as a result of this experience was best qualified to take up the design of a new hull of the type to be used for the NC flying boat. As the result of his experience in the design and testing of pontoons, he decided that a very satisfactory float could be produced by modifying the design of the R-6 pontoon, which had proved very successful in its use in seaplanes. The shape of the V bottom is similar to that of the Curtiss H-16 flying boat and to the British F-5, which was later adopted by the United States Navy. Changes were made in the shape of the deck of the pontoon at the bow to allow for a gunner's cockpit, and the stern was changed to allow for the stresses produced, due to the weight of the tail surfaces to be supported from the stern to the hull.

To provide for the heavy weights to be carried in the hull, for which no provision was made in the design of the R-6 pontoon, the internal construction was necessarily very different from that of the pontoon. The design called for sufficient strength for 10,000 pounds of gasoline in the hull in addition to the weights of the crew and spare parts which would also be carried there. To provide this necessary strength a fuselage structure of ash and spruce was the basis of construction. To this fuselage structure suitably designed floors, floor stringers, keels and side keelsons, and the framework to support the hull deck are attached. By means of five 2-ply mahogany bulkheads the hull is divided into six compartments. Access from one compartment to another is had through water-tight bulkhead doors. At the points where the wing beams are attached these bulkheads are suitably braced with spruce strips and steel straps, so that the weight of the hull is distributed throughout the bulkheads and to the wing beams without producing excessive strain on any one part of the structure.

Before the design was entirely detailed a model of the complete plane was tested at the Washington Navy Yard Wind Tunnel. A similar model was made later and tested in the wind tunnel of the Curtiss Engineering Corporation. The tests were made to determine the life and drag of the complete machine and its longitudinal stability.

In direct charge of the design, which was under the general supervision of Commander Westervelt, the Curtiss Engineering Corporation detailed Mr. W. L. Gilmore, their assistant manager; Mr. S. V. Davis, who had charge of their drafting room; and Mr. J. A. Christen, who was in charge of the drafting force which was working particularly upon the design of the NC parts. Working with these men and looking after all information regarding changes in design, the strength of parts and the effect upon the strength of various parts of changes in the design, was Ensign C. J. McCarthy. The design work was started at the plant of the Curtiss Engineering Corporation in Buffalo, and in December, 1917, was removed to the new plant of this corporation which had just been completed at Garden City, Long Island. It is interesting to note in connection with this removal that all those engaged upon this design work completed their work in Buffalo at the usual time in the afternoon, were carried to Garden City on a special train at night, and reported for work at the Garden City plant on the following morning, without the loss of time on the design work.

The design, because of the immense amount of detail involved, seemed to progress very slowly, and it was not until January 19, 1918, that it was finished sufficiently to begin the building work of the machines. For this construction work a contract was made with the Curtiss Engineering Corporation for four complete seaplanes. For these craft the Navy Department was to supply three of the hulls and all the engines. The fourth hull was to be built by the Curtiss Engineering Corporation. A contract was let on the basis of actual cost plus 10 per cent for profit.

To facilitate construction, various parts were made under subcontracts from the Curtiss Co. The principal ones which may be noted are as follows: Wing panels, control surfaces, and wing struts were built by Locke & Co., of New York City, expert manufacturers of high-class motor car bodies. Metal parts were made by Unger Brothers, Newark, N. J., manufacturers of silverware, jewelers. Later, to expedite the production of metal parts, some of these

were manufactured by the Beaver Machine Works, of Newark, and some by Brewster & Co., of New York City. Wing-tip floats were built by the Albany Boat Co., builders of high-class steam launches and motor boats. The outriggers supporting the tail were built by the Pigeon-Fraser Hollow Spar Co., of Boston, makers of masts and spars for racing yachts. The gasoline tanks were built by the Aluminum Co. of America, of Pittsburgh. The construction of these tanks was the largest and most difficult job of this nature ever undertaken by an aluminum manufacturer. Two of the hulls to be supplied by the Navy were built by Lawley & Sons, of Neponset, Mass., and one by the Herreshoff Manufacturing Co., of Bristol, R. I. These hulls were built on the basis of cost plus 10 per cent profit of an estimated cost, with the understanding, if the cost could be reduced below the estimated cost, the contractor would be paid 10 per cent on the estimated cost and in addition 25 per cent of the difference between actual and estimated costs.

To assist the Curtiss Co. in expediting the production of these parts, and to aid in every way in the construction and assembly of the machine, four officers were detailed by Commander Westervelt from his force to work with Mr. Gilmore, of the Curtiss Engineering Corporation, who had been placed in full charge of the construction work on these four machines. Only because of the faithful work of these officers was it possible to complete the construction of the first of these flying boats in September, 1918.

This boat, known as the *NC-1*, had a power plant which consisted of three low-compression direct-drive Liberty engines, arranged to drive tractor propellers. This arrangement was chosen because of the necessity of keeping the weights of the motors forward to bring the center of gravity in the required position with respect to center of lift. After actual tests of the machine it was found that slight variations in the position of the center of gravity had practically no effect upon its operating characteristics, and it was decided to change the arrangement on the third and fourth boats to two tractor motors and one pusher motor. This installation was later decided on for the second boat as well.

The *NC-1* was completed and assembled for tests at the Rockaway Beach Naval Air Station in September, 1918. The engines were tried out for the first time on October 1, and the boat was weighed, to determine the total bare weight, on October 2. In weighing this machine four platform scales of 8,000 pounds capacity each were used. These scales were so placed that jacks resting upon the scale platforms could be placed directly under the engine section wing beams, at the outer strut stations. By jacking up the entire weight of the machine was transferred to these four points. The summation of the four scale readings gave the weight of the plane. By carefully adjusting the position of the machine, leveling it fore and aft and transversely, the weights as indicated on the scales made possible the calculation of the fore and aft position of the center of gravity. The total weight was 12,740 pounds. This weight did not include any supplies or equipment. It was the net bare weight of the machine itself. The estimated weight for the complete machine as worked out by the Curtiss Engineering Corporation was 11,900 pounds, 840 pounds or 6.6 per cent less than the actual weight. The center of gravity was 65 inches aft of the leading edge of the lower engine section wing panel, or 28 inches aft of the mean center of lift of the wing panels. This condition indicated very decided tail heaviness, and in the first trial flight which was made it was decided to place in the bow of the machine, 15 feet forward of the leading edge of the lower engine wing panel, a sand load of 1,755 pounds, so that with the weights of cooling water, pilots, mechanics, fuel, and oil the center of gravity would coincide with the center of lift. This would bring the gross weight of the machine in flying condition up to 16,500 pounds.

The first test of the *NC-1* was made on October 4, 1918. In this test, though the craft was very tail heavy, its operation as a whole was very satisfactory and indicated that the work of the designers had been a success. It was found necessary, subsequently, to make slight changes in the position of the horizontal stabilizer to neutralize this tail-heavy condition, but otherwise no radical changes were necessary in the design or construction. This result was very gratifying to those who had been concerned with the design and construction of the machine and proved that the criticisms which had been made during construction by individuals of considerable experience, including officers of the English Royal Air Forces, were without any logical foundation.

The tests made on the *NC-1* showed operating characteristics very much better, as regards lifting capacity and speed in the air, than had been indicated

by the wind-tunnel tests. With the three low-compression tractor engines it got away with a load of 22,000 pounds at a speed of 52 miles per hour, after planing approximately one minute. The wind-tunnel experiments had indicated a get-away speed of approximately 60 miles per hour and a maximum speed of approximately 72 miles per hour with this load. The actual test showed a maximum speed in still air of approximately 80 miles per hour. Because of this exceptionally good showing it was decided to install high-compression engines to determine what load could be handled in this way. Test made with high-compression engines showed the maximum lifting capacity to be 24,780 pounds, as compared with the original 22,000 pounds, for which the craft was designed. The get-away with this load was made under very unfortunate conditions as to wind and tide, and it is very probable that with more more favorable conditions the three high-compression engines would have been able to lift 25,000 pounds.

Because of the possibility which seemed to be indicated of the machine handling much heavier loads than the 25,000 pounds just mentioned, it was decided to install an additional engine and make tests to determine the limit of loading of the machines. According, the NC-2 was equipped with four high-compression Liberty engines, arranged one tractor and one pusher in tandem in a nacelle on each side of the center nacelle. The pilots and controls remained in the center nacelle as in the original design. With this arrangement of engines, the machine got away successfully with a load of 28,100 pounds.

There are several objections to the double-tandem arrangement of engines described in the preceding paragraph. The efficiency of operation of the two engines in tandem can never be equal to the efficiency of operation if the two engines were set up in separate nacelles; in case of failure of one of the tractor engines the pusher engine becomes exceedingly inefficient, because of the propeller of this engine having been designed to operate in the slip stream of the tractor engine, and there is the excessive torque on the rudder which would result from an attempt to keep the plane to its course if one or both of the engines in one of the tandem nacelles should fail in operation.

To obviate as far as possible the difficulties just outlined it was decided to install in the NC-3 and NC-4 four engines arranged with one tractor and one pusher in tandem in the center nacelle, and one tractor engine in nacelle on each side of the center. This arrangement would provide for a better efficiency of operation and for fewer difficulties in operation due to a breakdown of any one of the engines. Trials made on the NC-3 and NC-4 proved this arrangement very satisfactory, and it was adopted for the installation to be used on the trans-Atlantic flight.

Such is the story of the design and construction of the NC flying boats. The performance of these machines in the recent trans-Atlantic flight, both in the air and on the water, shows the excellent results that may be obtained by the application of real engineering principles of design to the solution of problems seemingly as impossible of solution as was this one when first taken up by the bureau.

HISTORY OF NAVAL AIRCRAFT FACTORY.

The idea of having an aircraft factory owned by the Government came up in the summer of 1917, shortly after the declaration of war, at a time when it appeared unlikely that existing plants in the United States for aircraft construction would be able to cope with the large orders being thrown upon them by the Army and Navy. The advantage of such a Government-owned establishment was evident:

(a) For increasing the sources of supply and insuring to the Navy seaplanes as and when wanted.

(b) For developing new models and improving existing models, and to this end building up a competent engineering staff. (In service minor changes become necessary to improve the military characteristics of the units. These changes can be introduced promptly in a Government-owned plant, due to its appreciation of the military aspects of the problem, after which other manufacturers of the same type of machine may be instructed by means of data furnished by the Government plant.)

(c) For obtaining information, for the department's guidance, of the cost of production and experimentation.

In June, 1917, therefore, an investigation was made to determine a suitable location, size, and cost of naval aircraft factory, based upon a capacity of 1,000 school seaplanes per year. Upon recommendation by the Chief Con-

structor, the department, on July 27, 1917, with an allotment of \$1,000,000, authorized the building and operation of such a factory in the Philadelphia Navy Yard, to be under the direction of the commandant of the navy yard, but to be operated independently of existing yard divisions. A type of building was selected which could be built rapidly, but would be substantial and permanent, and included the factory proper, 400 by 400 feet, all under one roof, although divided into two sections, a section 300 by 400 feet, containing the manufacturing departments and offices; a high assembly shop, 100 by 400 feet, with a 10-ton crane; and, in addition to the main building, dry kilns, dry-lumber storehouse, and boiler house.

On August 6 the contract was awarded for the construction of the plant, and August 10 the ground was staked out for the building. Naval Constructor F. G. Coburn, United States Navy, was detailed as manager and reported at the factory August 27. The construction of the building proceeded while machinery and equipment were coming in, and the low factory building was sufficiently finished on October 9 to enable the establishment of temporary offices in it.

Although designed to build school machines, it was desired in October to start the factory on the largest type of service machine used by the Navy, as the school-seaplane program was then well in hand in other airplane factories and the greatest need was for patrol machines. The factory was authorized, therefore, to proceed with the construction of 50 twin-engine flying boats (Curtiss H-16) as a part of the then authorized program. On October 12 plans and engineering data for this machine were received at the factory, and the work of ordering material and starting production was taken up. On October 17 actual work on the first boat was started, and on November 2 the keel was laid. In the meantime construction work was rapidly going forward, and the building was pronounced complete in every respect by the supervising civil engineer on November 20, 110 days from the award of the contract for its construction.

In December, 1917, the number of large flying boats in the Navy's program was about quadrupled and the capacity of the factory had to be increased. The first problem was whether to construct a balanced factory to supply the needed capacity, but after considerable discussion it was decided that the time required for the erection of the building, the assembling of sufficient personnel, etc., was so great as to preclude this solution. It seemed better to utilize available plants in the industrial world for the production of parts and to erect as an enlargement of the naval aircraft factory an assembling plant to be fed by these sources of parts and minor assemblies.

On January 25, 1918, the Aircraft Board, at the instance of the chief constructor, passed a resolution recommending an allotment of funds necessary for this project, and it was approved by the Secretary of the Navy February 9, 1918. The contract for the new storehouse and office building was awarded on February 23, 1918, and for the assembly building on February 28.

The assembly building consisted of two parts: A low building, 13 feet under the roof trusses, for panel shop, varnish and dope room, pontoon manufacture, etc., and a bay 100 feet wide, 51 feet under the trusses, and 680 feet long for final assembly, flanked on each side by a bay of equal size, 50 feet wide and 30 feet under the trusses. The 100-foot bay was equipped with two 10-ton, three-motor, overhead traveling electric cranes, and the side bays each with a 2½-ton small crane. The plan was to manufacture and assemble wings, pontoons, and similar parts in the low section, assembling them to jigs and packing them for shipment, the boat hulls to be put through final assembly and packed and shipped from the high bay, the flanking bays to be used for sub-assembling.

In the summer of 1918, when production was at its height, the assembly plant was drawing its parts from the Victor Talking Machine Co., now very largely given over to this work, from seven yacht yards, two small aircraft factories, a number of furniture factories, automobile body, and sheet-metal products factories. Except for the two small aircraft shops, all of these plants had been drawn into the work by the Naval Aircraft Factory Organization, which maintained branch offices in each of its contributory plants.

The direction of the entire program was reposed in the central offices of the naval aircraft factory, which necessitated enlarged office space. Therefore, a concrete three-story office building was erected to accommodate the offices, and the old office space was put into production. A six-story concrete storehouse, approximately 200 feet square, was provided to meet the enlarged

storage-space requirements, and the storage room in the original factory was thrown into production space. The dry kiln capacity was doubled, as was also the heated storage building and the lumber yards.

The original boiler house was a temporary structure, as at the time it was projected it seemed probable that a new power plant under construction for the navy yard could be relied upon to supply the power to the Naval Aircraft Factory, but the enlarged plant made it necessary to provide a permanent and larger boiler house.

The authorization included a hangar, which was necessitated by the increase in experimental work, in the development of new models and of new features in old models, requiring a considerable amount of alterations on completed planes, with test and demonstration flights. This hangar has a door 200 feet wide and 50 feet high and the building itself is 150 feet deep. In front of this hangar is an apron 200 by 100 feet, made of concrete with a concrete ramp flanked by concrete piers. The concrete is to be colored green to relieve the glare. Provisions are made for the simplification of handling planes on the apron and ramp.

Over 40 acres are occupied by the enlarged plant, the building having 888,935 square feet of floor space, 519,955 square feet of which is normally available for manufacturing purposes. A considerable increase in paving, railroad tracks, roadways, etc., was necessary, and was provided for in the allotment, which, including the hangar, amounted to \$3,678,000. A photographic view showing the layout of the plant is attached hereto.

The first mechanic was employed on October 1, 1917. By November 1, 1918, the entire force numbered 3,642 persons. The employment problem was a difficult one, particularly at the beginning, and most of the employees had to be trained to their work, including superintendents, engineers, inspectors, and foremen. Of 400 engineers and technical men not more than 10 had had previous airplane experience, and no bid was made for employees of outside factories. By an executive order of August 23, 1917, the special classes referred to were exempt from competitive examination under the civil service, but all others were obtained in accordance with its prescribed regulations. Special effort was made to train and utilize women employees, who finally made up practically 25 per cent of the entire force. A training school was also conducted for enlisted men to be sent abroad for assembly and repair of planes.

There were many other problems connected with equipping the plant, incoming sources of supplies, educating manufacturers in meeting specifications, expediting deliveries, and coordinating the work of the factory in all its branches, much credits being due Commander Coburn for the rapid and successful organization of the factory and for the record of production attained. Of the 50 H-16 twin engine boats ordered built in October, 1917, the first was completed and given a successful trial flight on March 27, 1918, being shipped on April 2. A production of one machine a day was reached in June, and last of these 50 boats was finished on July 2. The average factory cost of the last 20, including overhead, was reported as less than half the average of the first 10, and considerably less than such boats were costing the Navy from other plane factories.

Shipment of boats assembled at the factory began on July 6, 1918, and the total output of the factory, up to the date of the armistice, included the large twin-engine flying boats, together with 50 sets of spare parts for that type, and four experimental machines. A quantity of experimental work was also done in individual fittings and parts for service machines. The value of this output was more than \$5,000,000, and the total program, completed and in hand at the factory, at that time originally scheduled for completion by the summer of 1919, was for 830 twin-engine boats, which, with their spares, would represent a cost of about \$23,000,000. Of these, 542, or nearly 70 per cent, were canceled, only such boats being continued as were far enough along to make completion advisable as a business proposition. The type was one suitable for peace-time use of the Navy. Work was likewise discontinued at the works of subcontractors, and the factory force was quickly reduced to about 2,000, with a view to proceeding with the original policy of using it for the manufacture of training models, the development of flying, etc. The large new assembly building was converted into an aircraft storehouse for the reception of raw materials and of partially or wholly manufactured parts and assemblies which could be utilized in future work.

In stopping of work in subcontractors' plants the policy was adopted of effecting an adjustment which would be mutually satisfactory. No arbitrary

cancellations were issued. As far as possible opportunity was given the contractor to taper off his work and to return to peace-time activities without any greater shock or disturbance to his organization than could be accommodated by its inherent elasticity.

AIRSHIPS.

The United States had little or no experience in lighter-than-air work previous to the war. Including the Goodyear Co., which had built a number of free balloons, there were but two concerns in the country that had manufactured such craft. A dirigible, known as the A-1, which had been contracted for in 1915, and not completed until April, 1917, did not prove a success, was of no military value, and practically worthless, even for training purposes. It had been designed and its construction supervised by German talent employed by the Connecticut Aircraft Co., which had undertaken the contract. The development of airships had been accomplished largely by the German and French armies and naturally was kept secret, as far as possible. Some information had been obtained abroad in 1913, but it was meager and out of date by the time war became to be considered by us as a possible outcome of affairs in Europe.

Theoretical and experimental study of the problem was commenced by the bureau in the summer of 1916, and some additional information was obtained from England, which had made a certain amount of progress. In October, 1916, the chief of operations requested the preparation of designs for a training airship to carry six men and to have an endurance of four hours at 40 miles per hour. This request was modified in December to cover a speed of 45 miles, an endurance of 12 hours and 35 miles, a crew of three men, radio equipment for 150 miles, and provisions for alighting on the surface of the sea, with arrangements for being towed.

These military requirements were carefully compared with information available as to foreign construction and with an independent analysis of the coast patrol problem.

From British accounts a small airship was useful. We know they used a 75 or 80 horsepower motor, but did not know the speed, endurance, or load. It was clear, however, that for patrol work the endurance should be enough to permit daylight patrols of 10 or 12 hours' duration. At night a patrol airship would be relatively useless, and hence such an endurance seemed great enough.

The speed must be sufficient to enable the airship to get back—

The necessary lift required an envelope of about 77,000 cubic feet, which with ordinarily good hydrogen gas gives a total lift or buoyancy of 5,275 pounds.

The envelope was then designed to give this lift and made of a shape which should be easy to drive. Experiments were conducted at the wind tunnel at the Washington Navy Yard to determine the resistance of this shape in order that the speed could be computed. It appeared possible to obtain the desired speed of 45 miles, but without any margin to spare.

We had heard that the British dirigibles were fast, but aside from them there was no record of a dirigible of such small size ever having been driven at a speed so high as 45 miles. Unless the fin and rudder surface were correctly proportioned, there would be difficulty in steering the ship at high speed. A research in the wind tunnel was, therefore, undertaken with a model of the ship fitted with fins and rudders of various sizes and arrangements. From these experiments fins and rudders were designed which appeared to be on the safe side and to guarantee stability in flight.

The car to carry the engine, fuel tanks, pilots, and other weights was designed after aeroplane practice, and presented no difficulties, except balance. The fuel tanks might be in flight full or nearly empty and to avoid disturbing the trim of the ship the tanks must be under the center of buoyancy of the envelope. The weight of fins and rudders tends to make the ship trim by the stern and to balance this the fixed weights, engine, men, radio, blower, etc., should be placed forward of the center of buoyancy a sufficient distance. To provide for proper balance the car was designed to have the tanks in the rear end under the center of buoyancy of the envelope and the engine forward with the men and other weights between. This gave a long car resembling the fuselage of an aeroplane and distributed the weights correctly.

The next problem was the suspension of this car from the gas bag, or envelope, in such a manner as not to deform the bag or put undue tension on any part of its fabric. The envelope was merely a fabric gas bag held taut by internal-gas pressure and the greatest delicacy and skill were required in sus-

pending the car. The calculations involved in the design of the suspension had to be devised from general engineering principles, but were not very satisfactory on account of the indeterminate nature of the distribution of load between various suspension members. It was desired to use the lightest fabric for the envelope that could be considered safe and to this the suspension was to be attached so that the envelope would be held fair and stiff with no more than 1 inch of water pressure inside. The calculation made was an application of the naval architect's usual method for calculating the longitudinal strength of ships and appears to be justified by the results.

The ballonnet capacity was fixed at 25 per cent of the total volume of the envelope. Such a capacity was enough to compensate for the change in pressure incident to a change of 7,500 feet in altitude on a normal day. There were two ballonnets provided, one in each end of the ship, so they could, by manipulation of suitable valves, be used as trimming tanks. This system had been used on French and German dirigibles.

The required speed of 45 miles meant that at high speed the nose of the ship would tend to cave in, due to external pressure, unless the internal-gas pressure were about 2 inches of water. As it was not desired to carry so high a pressure, the nose was stiffened by battens of ash. This feature had been seen on English dirigibles.

The characteristics of the design were as follows: Length, 160 feet; diameter, 31.5 feet; height, 50 feet; power of main engine, 100 horsepower; power of blower engine, 2 horsepower; maximum speed, 45 miles an hour; cruising speed, 35 miles an hour; endurance at 45 miles, 10 hours; endurance at 35 miles, 16 hours; gasoline capacity, 100 gallons; ballonnet volume, 19,250 cubic feet; envelope volume, 77,000 cubic feet; cross lift at 0.068 pounds per cubic foot; 5,275 pounds; weight empty, 3,250 pounds; instruments, etc., 100 pounds; blower outfit, 100 pounds; radio outfit, 250 pounds; lighting set, 15 pounds; two men, 320 pounds; fuel and oil, 633 pounds; ballast, 290 pounds; margin, 311 pounds; useful load, 38 per cent, or 2,019 pounds.

By January 6, 1917, the designs and calculations, which were prepared under supervision of Naval Constructor J. C. Hunsaker, United States Navy, were sufficiently well advanced to indicate that an airship could be built which would materially exceed the military requirements specified by the Chief of Naval Operations in his letter of December 13, 1916, and preliminary plans and specifications were submitted to the Secretary of the Navy. The type was approved by the General Board January 26, 1917, and by the Secretary January 27, 1917. At that time it was the intention to build one or two airships as an experiment, but relations with Germany were rapidly becoming strained, and on February 17, 1917, the Secretary of the Navy authorized the construction of 16 airships of the type proposed.

In its letter to the department, the bureau stated that the construction of such a ship was within the capacity of the industrial facilities of the country, but to get delivery of 16 in any reasonable time seemed at first glance entirely impossible, when it was realized that the work would have to be done by firms entirely unfamiliar with the work and without allowance of time for experiment and research. It was clearly impossible to allow time enough to build an experimental ship to the bureau's design, and, after correcting any defects, to proceed with the construction of the other units. This would have been the normal peace-time procedure, but six months' time was not available, and a start had to be made at once. The bureau, therefore, decided to go ahead with the construction regardless of the unproved nature of the design, and on February 6, 1917, sent copies of the plans and specifications to five firms, which had offered their facilities to the department for war work and which were considered to be in a position to help. Representatives of these five firms met with the bureau on February 12 to discuss ways and means for getting the 16 ships built quickly.

The five firms requested to undertake the work were the Curtiss Aeroplane & Motor Corporation, of Buffalo; the Connecticut Aircraft Co.; and the three great rubber manufacturers, Goodyear, Goodrich, and United States Rubber. In spite of a very great desire to help the Navy, it was immediately apparent that no one of them was in a position to handle the work. In the first place, they were without experience in airship building, with the exception of the one unsuccessful attempt of the Connecticut Aircraft Co. None of the rubber companies had ever made fabric of the hydrogen-resisting quality and strength required, and it would be necessary not only to develop new processes but to put in new machinery and special equipment to manufacture it. Supplies of

the special fine cotton cloth needed would have to be obtained, and the market for it was in an abnormal condition.

None of the firms represented had any building large enough to erect an airship, and though the Navy was planning to put up eight airship sheds at coastal stations, the date of completion of such sheds was indefinite and probably too remote to render such sheds available for the first few ships turned out. It was of utmost importance that one ship should be rushed to completion to prove the design before the others were too far advanced.

It was agreed at the conference that the manufacturers should form a committee, which committee should arrange that each concern would bid for such proportion of the work as appeared to be within its capacity; that the raw materials, information, and experience of all would be pooled both before and during manufacture, and that each would bid a flat price with a guaranty and bond. The cost-plus contract, or "Navy order," was then unknown, and the bid price arrived at was purely an estimate based to a large extent on information from abroad which the bureau made available to the committee. The price agreed upon was about \$40,000 per airship, with a guaranty to produce a practical ship making more than 35 miles per hour and a guaranty to replace any defective parts for three months. As things worked out, most of the contractors lost money, for the work was done as a rush job, and no expense was spared.

The Goodyear Co., as the most experienced, was in the best position to go ahead. R. H. Upson and R. A. D. Preston, aeronautical engineers of the Goodyear Co.'s staff, had had several years' experience in designing, making, and practical handling of free balloons. They could be relied upon to cope with the present problem. Goodyear agreed to put up at its own expense a complete erection and testing establishment consisting of a field near Akron, Ohio, with a large capacity hydrogen generating plant and an airship shed 200 by 100 by 100 feet, together with the barracks for the necessary field organization. This decision was reached March 20, 1917. Ground was broken for the hangar and hydrogen plant April 1, 1917, and the first balloon (a free balloon) was inflated in the hangar June 1, 1917.

The Goodrich Co., to make up for its lack of experience in making up airship envelopes, cabled for M. Juillot, the well-known engineer of the Lebaudy firm in Paris, with whom they had been in correspondence. M. Juillot sailed immediately and later, when the United States had declared war on Germany, the department was able to arrange for the release from the French Army of two of M. Juillot's assistants, M. Bourguignon and M. Gautier. These men, together with Mme. Bourguignon, who was a skilled fabric worker, were of the greatest assistance in introducing the practical refinements in manufacture about which information was so much needed.

The United States Rubber Co. decided not to attempt to build complete airships, but undertook to supply fabric for the Connecticut Aircraft Co.

On March 14, 1917, contracts were awarded as follows: Goodyear, nine airships; Goodrich, two airships; Curtiss, three airships; and Connecticut, two airships. The Curtiss Co. undertook to supply cars, power plants, and fins to Goodyear and Goodrich and later turned over its contract for three complete ships to Goodrich, supplying the same parts for them. Connecticut subcontracted for its cars and fins with the Pigeon Frazer Co., of Boston, and got its power plant from the Hall-Scott Motor Co., of San Francisco.

Much difficulty was experienced in developing the manufacture of satisfactory fabric, but through intensive research and improvement material was finally turned out which by comparative test proved to be superior to any produced in England, France, or Italy, during the war.

For some of this improvement, credit must be given to information received from England after the United States declared war. The English methods were of the greatest assistance. With them as a guide, the American manufacturers were able to adopt their own peculiarly American shop practices to work out a fabric which finally equaled the best foreign product.

The Goodyear Co. completed the first airship in May, 1917, before their shed at Akron was completed. The Goodrich Co. had in the meantime found an abandoned shed at the "White City," Chicago, put it in order, and arranged for a large supply of hydrogen in flasks. In order to get a trial of a type ship for the benefit of all contractors, it was arranged to ship the first Goodyear ship to Chicago. The ship was assembled, inflated, and given a short flight by Mr. R. H. Upson, of the Goodyear Co. He was so favorably impressed with the results that on the second time up, the weather being favorable, he con-

sidered there was less danger in trying to fly home to Akron than in attempting a return to the little field at Chicago which was seriously restricted by buildings and telegraph wires.

Accordingly, he headed for Akron at midnight and at noon of the next day, Decoration Day, 1917, landed in a meadow 10 miles from Akron. Had the oil supply held out he could have landed on the Goodyear field, but the motor ceased at the last minute.

The flight is remarkable in several particulars. In the first place, it was one of the longest dirigible flights on record up to that time. In the second place, it was a maiden flight of a new airship designed from theoretical and experimental data by a designer of no experience and built in two months by a firm without previous airship experience. In the third place, the flight is astonishing because Mr. Upson was not then an airship pilot, and, by our present standards, could not have been expected to handle the ship until he had gone through weeks of instruction at the hands of an experienced pilot. However, he was an experienced ballonist and as an engineer had thorough appreciation of how the airship was designed to function.

This flight was very encouraging for the production program, as it proved that the design was all right and permitted the contractors to go ahead with confidence. From then on the ships were delivered with regularity and by the end of the year were operating at the various naval air stations.

The following tables give the dates of delivery of these ships:

No.	Manufacturer.	Date.	No.	Manufacturer.	Date.
B-1.....	Goodyear.....	July 19, 1917	B-9.....	Goodyear.....	Jan. 31, 1918
B-5.....	do.....	Aug. 11, 1917	B-8.....	do.....	Feb. 25, 1918
B-13.....	Goodrich.....	Sept. 11, 1917	B-7.....	do.....	Feb. 27, 1918
B-3.....	Goodyear.....	Oct. 22, 1917	B-6.....	do.....	Mar. 3, 1918
B-4.....	do.....	Dec. 4, 1917	B-10.....	Goodrich.....	Apr. 15, 1918
B-15.....	Connecticut.....	Dec. 14, 1917	B-16.....	Connecticut.....	Do.
B-14.....	Goodrich.....	Jan. 11, 1918	B-11.....	Goodrich.....	May 8, 1918
B-2.....	Goodyear.....	Jan. 22, 1918	B-12.....	do.....	June 6, 1918

As the airships came along improvements and changes based on experience were incorporated. Suggestions for improvements in details of design came first from the contractors and later, as more Navy pilots became trained, a few useful suggestions came from the service. The Goodyear Co. proposed many refinements in design which they introduced as a result of the experience of their test pilots, Mr. Upson and Mr. Preston. The enterprise of that firm in providing a flying field at Akron near their works placed them in a position to experiment in the air.

The improvements of most interest were those which led to an increase in speed. The first ships had a speed of about 40 miles per hour. It was found that one of the vertical fins could safely be left off, thus cutting down the resistance of one fin and its supporting wires. Later the car was suspended closer to the envelope, shortening the suspension and saving resistance. Still later the suspension itself was simplified and knots and loops cleaned up. A somewhat longer and easier form of envelope gave greater lift and probably less, or at least no more, resistance. The air pipes to the ballonets were placed inside the envelope to save resistance. Improved propellers were developed also. The air scoop finally became only a short sheet metal tube hinged to the envelope proper, which could be let down into the ship stream of the propeller or pulled up out of the way, greatly decreasing the resistance and weight of the ship by eliminating the scoop under the car, the blower and air line to the bag.

As a result, the speed was progressively raised from 40 miles to 48 miles with the same engine. The designed maximum speed was 45 miles per hour, but the contractors were required to guarantee 35 only.

A gratifying feature of the construction was the weight. If the ships had run over the designed weight their usefulness would have been seriously compromised. Fortunately, all ships, including the first of the series, showed a useful lift in excess of the designed load. In some cases it appeared that the structural weights would run over, but in those cases the buoyancy also ran somewhat in excess of the designed figures, leaving a good margin for the useful load.

The Navy's first attempt to design, build and operate airships, though fraught with difficulties, was, on the whole, very successful. This is to some extent due to the modest size selected for the first attempt, but mainly to the energy

and enthusiasm of the people concerned, both in and out of the service. The "B" class airships, as these 18 were called, were used at home for training and coast patrol. In France our air forces operated French ships and in England, English ships. But though the B ships had no direct war service, they contributed their mite by training our pilots so that they could go abroad and take over immediately the operation of the foreign types. About 170 pilots were so trained in the United States on B ships before the armistice. In addition, B ships were used on coast patrol and flew over 13,600 hours or about 400,000 miles.

The B-class airships are not an improvement over contemporary English airships of the same type, and are in some respects less handy and simple, though of greater carrying capacity and endurance. The noteworthy features are the conditions of their design, manufacture, and initial operation. The ships were put into production from plans without waiting for the perfection of an experimental ship.

After the completion of the B-class ships, there was an almost complete stop to airship work in the United States, and an improved single-engine type which was designed in the winter of 1917-18 was not built. The reason for this was a discouraging report from abroad as to the effectiveness of airships on anti-submarine patrols. But the conclusion drawn from airship operations abroad in the bad winter weather proved to be premature. As the good weather of the spring of 1918 permitted English and French airships to operate more freely, it became apparent that we should proceed immediately with a larger and faster type. Using this time all of the practical experience gained at home with B-class ships, and detailed information from abroad with regard to British, French, and Italian airships, the bureau undertook to take a step in advance and to design a ship of maximum performance. Full use was made of all available sources of information. In the initial stages of the design the data regarding the performance of British airships, obtained from the British Admiralty through Lieut. Commander P. L. Teed, R. N. V. R., who was attached to the office of the British naval attaché at Washington, was especially helpful.

Experience showed the advantages of high speed to cope with winds, great endurance to follow convoys long distances, and a duplicated power plant to lessen chances of complete breakdown at sea. The C class was designed with these ends in view.

To obtain high speed, a new form of envelope and car, of very low resistance, were developed from wind-tunnel experiments. The speed was to be obtained by a combination high power with the utmost refinement in design to keep down resistance. Twin engines were used giving a total of 250 B. H. P. The actual speed on trial was 60 miles per hour, making probably the fastest airship of its size ever built.

During the intensive research to improve the B-class envelope fabric it was determined that deterioration was largely caused by the combined action of heat and the actinic rays of sunlight. Attempts were made to meet the trouble by filtering out the actinic rays through coloring first the exterior of the fabric and later the rubber as film between the plies of cloth. Proper coloring materials were hard to get, and it was usually found that the deterioration resulting from the heat absorbed by the fabric was nearly as rapid as before. About the time the C-class design was begun, information from abroad showed that the British airships were suffering from the same troubles, and that the most successful protection for the fabric was a coating of aluminum powder, the object of this coating being to stop all the light from going below the surface of the envelope and to reflect and radiate quickly nearly all the heat. The C-class envelopes were made of fabric coated with bright aluminum. This fabric has been found in comparative exposure tests superior to the best developed during the war in England, France, and Italy.

The principal dimensions and characteristics of the C-5, as weighed off before her start for Newfoundland, were as follows: Length, 192 feet; diameter, 41 feet 9 inches; volume, 182,000 cubic feet; purity (98.6 per cent), temperature (65° F.), total lift, 12,700 pounds; barometer, 30; weight, empty, 7,940 pounds. Weight carried: Crew (6 men), 1,015 pounds; fuel, 3,250 pounds; oil, 120 pounds; navigating equipment, 25 pounds; radio, 250 pounds; food, 15 pounds; water for drinking, 85 pounds; ballast, 0 inch; useful load, 4,760 pounds. Endurance at 45 miles per hour, 47 hours, or 2,150 miles; endurance at 55 miles per hour, 28 hours, or 1,540 miles.

During 1918, contracts were placed with Goodyear and Goodrich for 30 airships, the cars to be supplied from the Burgess Co., Marblehead, Mass. After the armistice contracts were reduced to 15 ships.

C-1, the first ship, was completed in September, 1918, and on its maiden trip, October 22, 1918, flew 400 miles from Akron to Washington, in eight and three-quarters' hours. It flew over the Navy Department Building and landed at Anacostia to permit an inspection by officers of the department. It then proceeded to Rockaway, Long Island. Later in the year the C-1 was ordered to Key West and flew down the coast, stopping at intermediate air stations.

The C-5 on May 14, 1919, flew from Montauk to Newfoundland with six men in 25 hours, 50 minutes, a distance of 1,022 nautical miles on chart without stop. This flight will remain for a long time as a notable achievement. The distance actually flown (not being in a straight line) was about 1,200 nautical miles, or nearly the distance from Newfoundland to the Azores.

The C-5 was unfortunately lost at Newfoundland in a gale while moored out in a field, and was, therefore, unable to attempt the trans-Atlantic flight, which was within her designed endurance.

The Navy's first airships, the B class, were thoroughly practical ships, and, while not remarkable for performance, are interesting as the solution of a design and production problem. The Navy's second lot of airships, the C class, were in performance, an enormous advance over the B class and placed us at once abreast of the times. These ships are generally admitted to be, for their type, equal to or superior to anything abroad.

CONVERSION AND REPAIR OF VESSELS TAKEN OVER DURING THE WAR.

1. These vessels logically divide into three main groups: (a) Troop transports, (b) Naval Overseas Transportation Service vessels, and (c) other vessels.

2. As soon as it was decided to send troops abroad, the necessity arose of developing a fleet of vessels for carrying the troops, as up to that time there were only a few vessels manned and operated by the War Department that were fitted for this special service. Due to the exigencies of the situation, it was determined to fit out the vessels under naval supervision, as they were to be operated by the Navy, the main features to be made satisfactory to the War Department. With the information and experience available in the Navy and from the War Department, the various navy yards undertook the conversion of the vessels concerned or arranged for same at private plants.

3. The majority of the transports at first fitted out were the ex-German passenger vessels seized in United States ports. In addition, a considerable number of merchant-passenger vessels and some large cargo vessels were converted to the above purpose; also a number of vessels were fitted for cross-channel service in carrying troops for short periods only.

4. The main features of conversion were: (1) Armament, including communication and lookouts, (2) accommodations for naval complement, (3) berthing the troops, (4) messing the troops, (5) improvements in watertight integrity and stability, (6) life-saving appliances, (7) fitting of paravanes and other protective devices, (8) storerooms and cold storage, (9) fresh water, (10) fuel capacity, (11) hospital arrangements, (12) toilet and washroom facilities, and (13) ventilation.

5. Many of the arrangements in connection with the above features were, due to the rush of work, either of a makeshift or experimental nature, as this country had never before been called on for such a vast undertaking.

6. As the war proceeded and experience was gained, much improvement was made in all the arrangements and the navy yard, New York, developed and standardized a great many features locally. Using data and information available, the bureau, cooperating with the War Department and all others concerned, developed, standardized, and issued general specifications for fitting out vessels as troop transports.

7. Of the features mentioned in paragraph 4, the cafeteria system of messing the troops, the providing of adequate forced ventilation, and metal folding type standees with wire fabric bunk bottoms contributed greatly to the increase in troop-carrying capacity of the vessels, in many cases the capacity being eventually practically double that as originally fitted out. Practically all of the vessels lacked watertight integrity to resist torpedo attack; and transverse bulkheads were installed, doors and air ports permanently closed where practicable, drainage system greatly improved, holes cut in longitudinal bulkheads to improve stability in damaged condition, and ballast installed to handle all usual conditions of load. In addition to the systematic reports required from

the vessels as to loading, ballasting, and time of roll, "floodable length curves" were worked out in the bureau whereby the conditions that would result from any damage were closely ascertained. Thorough instructions were issued to commanding officers as to how the watertight integrity and stability could best be maintained, as much depends on the personnel in this regard. The most notable example of the results attained is that of saving the *Mount Vernon* after being struck abreast the firerooms by a torpedo. The hospital arrangements also became of great importance as the casualties abroad increased.

8. The repair of troop transports developed into a large proposition. When navy yards could be used, the repairs were done there. The great bulk, however, of the repairs was done at private repair yards under naval contract and supervision of navy yard representatives.

9. In addition to the vessels already in service that were fitted out as troop transports, arrangements were made whereby a large number of those building for the United States Shipping Board Emergency Fleet Corporation, were to be fitted out so as to be ready as troop transports when completed by the builders. These arrangements were made by a joint board consisting of a representative each of the War Department, Navy Department, and Emergency Fleet Corporation. This board was largely governed by naval experience and requirements, and greatly expedited the preparation of plans and data for the use of the builders, who were required to prepare the plans under the direction of the board for final approval by the War and Navy Departments and the Emergency Fleet Corporation.

10. Outside of the armament, the main features required for naval overseas transportation service were: (1) Accommodations for the larger naval personnel necessary for efficient operation under war conditions, (2) increasing storeroom space and fresh-water capacity, (3) increasing fuel capacity and providing sufficient ballast for long trips, (4) accommodations for passengers where practicable, (5) increasing life-saving facilities, (6) providing or increasing cargo fuel oil capacity where practicable, (7) fitting of paravanes, and (8) strengthening or providing stronger steering gear and cargo handling gear to meet the heavier demands on these features, providing ample spare parts for the machinery involved.

Some of these vessels in service or at first turned out (mainly merchant tonnage commandeered by the Emergency Fleet Corporation) were much lacking in structural strength, stability, and watertight integrity required for trans-Atlantic service and to resist underwater attack. These features were investigated and corrected as far as practicable, though some ships were practically hopeless in this regard. The later ships, being those designed by the Emergency Fleet Corporation, were much better as to the above features. There was a great shortage of fuel oil abroad, and every effort was made to convert and utilize double bottoms, and other tanks available to carry fuel oil where practicable. Much work was done in this respect.

11. The methods of fitting vessels for this special service were standardized as far and as rapidly as possible, by the Bureau of Construction and Repair, through correspondence and conferences with the Naval Overseas Transportation Service section of Naval Operations, the other bureaus concerned, the district sections of Naval Overseas Transportation Service, and the Emergency Fleet Corporation; and agreement was finally reached whereby the vessels building by the Emergency Fleet Corporation would be fitted out as far as practicable and ready for naval crews and guns when taken over by the Navy. The Navy Department made up and issued specifications for these changes after the details had been fully developed and discussed by the bureaus and all concerned.

12. In addition to the above many vessels of the Naval Overseas Transportation Service were fitted out by the War Department for carrying animals, gas shells, etc., special fittings being required for such service.

13. The fitting out and repair of Naval Overseas Transportation Service vessels was done mainly by private repair plants under contract and naval supervision, although work was assigned in navy yards whenever practicable. The naval supervision was mainly handled locally by a special Naval Overseas Transportation Service organization under each naval district commandant.

14. Various other vessels taken over from private hands were fitted for special service, such as mine carrying, gunboat and patrol duty, etc., a description of which would be purely an outline of various minor alterations, repairs, and equipment, and therefore of no particular interest.

ARMING OF MERCHANT VESSELS.

1. Prior to the entry of the United States in the war with Germany a small number of merchant vessels had been furnished with naval guns and a naval armed guard with a view to repelling attacks of German submarines on our then neutral shipping. The first vessel armed was the *Manchuria*, on March 8, 1917.

2. After April 6, 1917, the arming of merchant ships became general. The fitting out of a vessel to take an armed guard was, of course, done by the owner, but the features installed were necessarily supervised or inspected by naval representatives and required to comply with naval standards before a battery would be installed at a navy yard or at a private plant under naval contract and supervision. A conference was arranged representing all the main naval districts, the naval bureaus concerned, the Shipping Board, and the War Department, at which general specifications were drawn up and issued by the Navy Department on August 9, 1917. A later conference resulted in a revised set of specifications issued as of December 27, 1917, with minor corrections on January 16, 1918. These specifications covered arming merchant vessels for trans-Atlantic service. When the submarine menace came to the Atlantic coast special modified instructions were issued as to arming coastwise vessels also, these instructions being by the Navy Department as of July 31, 1918.

3. The main features of the armed-guard requirements covered: (1) Gun foundations and working platforms; (2) lookout stations and communication to bridge and guns; (3) ready service ammunition boxes; (4) magazines, including flooding, lighting, and ammunition handling; (5) accommodations for armed guard, including berthing and messing, toilet and washing facilities, store-rooms, gun-crew shelters near the guns, and general alarm system; (6) signaling apparatus; (7) smoke-making apparatus; and (8) life-saving apparatus.

4. Early in the war the United States Shipping Board Emergency Fleet Corporation, after arrangements with the Navy Department, issued instructions regarding vessels building and in commission with reference to arming and armed guards. The bureau had prepared as far as practicable and issued to the Emergency Fleet Corporation and to all naval districts standard plans for the built-up foundations for the various caliber guns to be installed. These plans were necessarily general only and had to be modified to suit local conditions on each ship. The Emergency Fleet Corporation also forwarded many sets of plans of new vessels to the bureau for criticism and approval as to gun foundations, magazines, etc. For certain smaller types of Emergency Fleet Corporation vessels the Navy Department approved certain departures from the standard specifications to meet local conditions on board. This was done also in some special cases upon representations from the owners of vessels. In general, however, the standard specifications were insisted upon, and armed-guard installations were rather fully standardized. Armed-guard ships were rigidly inspected upon each entry into an American port and kept up to standard as to material as well as personnel.

PREPARATION OF MINE-PLANTING FLEET.

1. In the latter part of 1917 it was determined to fit out a number of ships for the special purpose of mine planting. The *Roanoke* class, consisting of that vessel and the *Canonicus*, *Canandaigua*, and *Housatonic*; the *Quinnebaug* class, consisting of that vessel and the *Saranac*; and the *Shawmut* class, consisting of that vessel and the *Aroostook* all merchant vessels, were selected for the above duty. General instructions were prepared in the bureau and sent to the navy yard, Boston, for the *Shawmut* class, and to the navy yard, New York, for the *Roanoke* and *Quinnebaug* classes, covering the general features required.

2. The main decks were practically cleared of all obstructions from near the bow to the sterns for the purpose of installing mine tracks. This involved removing all interior minor bulkhead, except the boiler and engine casings, and making arches in the main bulkheads. Four tracks were built, with the necessary turntables and switches, and extended to the stern, for launching the mines, except that in the *Shawmut* class and the *Quinnebaug* class the tracks were reduced to two at the stern, due to the small beam. Doors and ports were fitted aft and sterns were modified to permit the launching or the closure of the openings while not actually launching mines. The mines were mostly stowed on the tracks on the main deck and additional tracks on the lower decks, and there were winches installed for hauling them fore and aft. Bulkheads and watertight doors in way of tracks on lower decks were reconstructed to suit the tracks.

Stowage was provided for mine charges forward. From four to six elevators—electric or hydraulic type—were fitted forward on each ship for mine handling to lower decks. Special mine davits were fitted and 8 to 10 winches were installed on each ship to handle the mines. The winches also assisted in handling additional boats. Communication, telegraph indicator, and control systems, in connection with handling the mines, together with the necessary voice tubes, were installed.

3. A battery of one 5-inch gun and two 3-inch antiaircraft guns forward was installed on each vessel. The usual lookout stations and means of fire control and communication in connection with the above and for ship's service were installed. Necessary magazines were provided.

4. Adequate accommodations had to be provided for the naval complement. This included staterooms, messing spaces, hospital spaces, galley, toilet, and wash room facilities, and offices. Complete ventilating systems were installed and adequate storeroom and refrigerating room spaces were provided. Adequate ice machines were installed under the cognizance of the Bureau of Steam Engineering.

5. Due to the necessity, for strength and freeboard reasons, of closing the side ports below the main deck, arrangements had to be provided for coaling overhead from a collier. Other minor structural changes were made, auxiliaries overhauled, etc., as necessary to put the vessels in efficient condition.

6. Additional fresh-water capacity had to be provided, and there were also installed new or additional evaporators and distillers, under the cognizance of the Bureau of Steam Engineering. These added electrical demands required additional generating capacity, also under that bureau.

7. The steaming radius of the *Roanoke* and *Quinnebaug* classes was too small and so the hold forward of the boilers was fitted as a reserve bunker. The *Shawmut* class were converted to oil burners, which involved a great deal of structural work to provide the oil bunkers.

8. All the vessels were fitted with paravanes for protection against planted mines; also with additional boats, including necessary handling gear and stowage, for life saving and special ship's use. Life rafts were likewise provided, in accordance with the usual practice.

9. As these vessels were only required to be self-sustaining as a group with a repair ship, workshop facilities were limited to a few woodworking machines, together with a small equipment of machine tools furnished by the Bureau of Steam Engineering.

10. The *San Francisco* and the *Baltimore*, of the regular Navy, were fitted out with such of the special mine-planting features as are covered above, thus making in all 10 vessels fitted for mine planting.

11. The ex-merchant vessel *Black Hawk* was fitted out as a group repair ship for the fleet, the usual repair facilities being provided.

12. The mine-carrying capacities of the above mine planters are as follows: *Baltimore* and *San Francisco* 180 each, *Shawmut* class 330 each, *Quinnebaug* class 618 each, and the *Roanoke* class 862 each.

13. The mine planters were kept supplied by 22 lake vessels, specially fitted as mine carriers.

14. The fleet was ready for service early in 1918, and performed a large share in the planting of the North Sea barrage, its expeditious and thorough accomplishment of this work having been the subject of much favorable comment, which was likewise applied to the equally difficult and dangerous work of clearing this mine field, in which about 36 of the mine sweepers and 24 of the sub. chasers were employed to advantage.

CONVERTED MINE SWEEPERS.

At the time of the entry of the United States into the war the Navy had a very few vessels equipped for mine sweeping. These were in general old torpedo boats of no further value for their original purposes, or else tugs belonging to the fleet and hastily fitted for sweeping in addition to their regular work. Our entry into the war brought the Navy Department face to face with the possibility that German submarine mine layers might at any time begin operating off our Atlantic coast, and this possibility necessitated the immediate fitting-out of a greatly increased number of vessels for sweeping. During the months immediately before and after our entry into the war, inspection boards, throughout the country examined many-hundred vessels of every description. From

among this number several hundred were reported as being suitable for use as mine sweepers, most of them being also reported as suitable for patrol work. As this latter work was the most pressing in importance, the inspected vessels, as fast as they became available for Government use, were assigned to the various naval districts and hurriedly fitted out for patrolling. As the patrol forces became more or less organized, the most suitable vessels from among them were selected for fitting out for sweeping. Those selected included a number of yachts and a good many tugs, but the type most generally chosen was the steam trawler.

As the personnel available for manning these boats was in general entirely ignorant of mine sweeping, the most pressing need was to fit out as quickly as possible a few vessels in each district which should operate with the torpedo boats already equipped for sweeping, and from them learn the rudiments of the work. The vessels in hand being of all sorts and sizes (the United States had at that time no specially constructed sweepers), and the mine sweeping gear being somewhat undeveloped both in quantity and completeness, each installation was necessarily a problem to be solved separately, with scanty information available as to the difficulties which might be expected to be met during the actual work of sweeping. As fast as the vessels having these first installations were fitted out after a fashion, they were sent out to work. The difficulties they encountered began to be reported back to the fitting-out yards, and as experience was gained both by the sweeping crews and by the fitting-out yards, the installations were improved and standardized. At the beginning the fitting-out yards had examined the existing installation on the fleet tugs, and the old torpedo boats, but the experience gained by these vessels had caused them to develop and improve their methods according either to the peculiarities of the individual vessel, or to the ideas of the personnel on board. Consequently in studying these installations with a view to getting suitable installations on the miscellaneous fleet being fitted out, the first thing that appeared clear was that hardly any two vessels of those fitted before hostilities commenced, were using exactly the same methods, or in fact the same gear. A feature that one vessel's crew would consider essential, would be condemned by another crew as entirely unsatisfactory. The result was that the standard sweeping gear as it existed at that time, was put on board as then seemed best, and the vessels, with very few other changes, were shoved off to work out their own salvation. The defects in installation which inevitably showed up as a result of this lack of familiarity with requirements, when reported back to the fitting-out yards, gave the Bureau of Construction and Repair and the yards actually making the installations, a considerable volume of information as to what was needed, as well as what to avoid.

The hand reels which had been part of the original standard gear were found to be far too slow and difficult to operate, and steam winches were added as fast as possible. Similarly, the 6-foot kilts which had in the beginning been used to a considerable extent, were as far as possible replaced by 12-foot kilts.

The patrol and sweeping work involved in most cases much harder usage than the vessels had heretofore experienced, and the natural result was development of a good deal of leaking and machinery trouble. As the vessels came in to have these defects corrected, advantage was taken of their inactivity to standardize the sweeping installations and to do what work was practicable toward improving the living conditions on the vessels and fitting them more in conformity with usual naval practice. These latter changes consisted generally in increasing the berthing, improving the galley and messing arrangements for the crew, mounting such guns as they could carry, adapting the electric plants for naval purposes, installing radio and signaling equipment, improving the outfit of boats and their davits, increasing capacity for coal, water, and stores, and many other items necessary for operating vessels efficiently under naval routine and unusually strenuous conditions.

From the point of view of the work done on the vessels themselves, as distinguished from the developments in the sweeping gear, probably the most interesting refitting work resulted from an order issued June 7, 1917, to fit 12 mine sweepers for foreign service; it being the intention to use them for coastal convoy work abroad. The 12 vessels so selected were the following, all wooden steam trawlers:

Name.	Fitting-out navy yard.	Length.	Breadth on load-waterline.	Date of commissioning for foreign service.	Remarks.
Raymond J. Anderton	Boston	<i>Ft. in.</i> 139 7	<i>Ft. in.</i> 23 8	Aug. 18, 1917	Stranded off Lorient, France, and sunk, Jan. 12, 1918.
Philip K. Bauman	Norfolk	158 0	24 0	Aug. 10, 1917	
Winfield S. Cahill	do.	137 0	24 6	do.	Foundered off French coast returning to United States, Apr. 27, 1919.
City of Lewes	Philadelphia	150 0	24 0	Aug. 12, 1917	
Warren J. Courtney	Norfolk	143 0	23 4	Aug. 10, 1917	
Otis W. Douglas	do.	140 0	24 0	do.	
Wilbert A. Edwards	do.	149 0	23 10	do.	Delayed by repairs; did not go to France.
John B. Hinton	do.	149 6	23 9	do.	Foundered Apr. 28, 1919.
B. H. B. Hubbard	do.	135 0	22 0	do.	
W. T. James	do.	140 0	22 0	do.	
Kenneth McNeal	do.	147 0	24 0	do.	
Rehoboth	Philadelphia	150 0	24 0	do.	
					Foundered off Ushant, France, October, 1917.

The sweepers, as fitted out for home waters, would be operating practically without fear of molestation from enemy vessels. For these a single 6-pounder gun, mounted forward, was considered a sufficient battery, and a small steaming radius, although undesirable, was not a vital defect. In fact, in these local sweepers additional coal and water capacity was only provided as opportunity offered. But the fitting out of the 12 for distant service opened up a whole series of new problems. It was decided that at any sacrifice the 12 vessels to go abroad must mount two 3-inch guns high enough up to be serviceable in almost any weather. Coupled with this was the requirement that they must have a steaming radius of 2,500 nautical miles, though this was later reduced to 2,000 miles.

The vessels selected were all wooden Menhaden trawlers, and nearly all of the same general design. While they had formerly done more or less outside work they were not, properly speaking, deep-sea vessels, so that from the very beginning it was realized that they would run some risk of being lost on the trip across. The dimensions given above for the 12 show that they were small of beam. Each had one compound engine and one Scotch boiler. They had an unusually high freeboard, forward, giving them a very deep fore-castle compartment in which the fishing crews had been berthed. A very short fore-castle deck was followed by a deck house containing the galley and mess room for all hands. Aft this was a long, wide hatch to the fish hold, a compartment without fore and aft bulkheads and occupying about one-third of the length of the vessel. Aft of this was a small cross bunker, two small wing bunkers with the fireroom between them, and the engine room which extended clear aft to the rudder-post trunk. Over the machinery was a second deckhouse containing the trawl winch forward, a drum room over the boiler, and staterooms aft for the engineer's force. The remaining members of the crew were berthed in either two or three staterooms, which, with the wheelhouse, were built on top of the forward deck house.

As the large fish hatch was an element of considerable weakness it was no surprise to find, on decking these vessels, that they were, in general, badly hogged; that is, the bow and stern had dropped. As the guns would necessarily be mounted well forward the ends it was realized that the refitting of the vessels must contemplate keeping as much weight as possible over the middle of the length, to "iron out," as it were, the hump in the keel. Any longitudinal strengthening was out of the question except as a loss of time which was prohibitive. For hygienic reasons it was determined to deck over all but a small part of the fish hatch, and extend the forward deck house well aft into the waist, thus permitting berthing all the crew in the two deck houses, where they could get ample light and air. The two 3-inch 50-caliber guns were mounted on top of the deck houses, one forward and one aft, both on the center line. Location of the guns in the waist, which would have been much simpler and quicker, was decided against, as in such a position the guns would have been awash in almost any kind of sea. To make room for the forward gun it

was necessary to move the wheelhouse and the whole upper deck house bodily aft several feet. This upper deck house was also extended aft to provide space for a wardroom and sleeping accommodations for the officers. As the deck houses were of relatively light construction and the main deck fairly solid the gun foundations were designed so as to be entirely independent of the deck houses and consisted of structural steel boxes of the same height as the deck houses and standing on a broad, heavy bedplate, bolted directly to the main deck. Having worked out the arrangements for the guns the next consideration was coal and water.

Information as to coal and water consumption was very meager, but with the help of results obtained from a short endurance run on one boat an approximation was arrived at as to the amount needed to steam 2,000 miles. A wooden bulkhead was thrown across the fish hold, so as to give on the after side bunker space, which, when added to the existing bunkers, would carry enough coal for the trip. Forward of this new bulkhead the remainder of the hold was given up to fresh-water tanks, an ammunition locker, ice box, and storerooms. At this time no suitable steam winches were available for installation for handling the mine-sweeping gear, but at a suggestion made by one of the officers attached to the mine-sweeping flotilla a modification of the trawl winch on each boat made it possible to utilize this winch for handling the sweeps. While the resulting installation was not free from drawbacks, it served to tide the boats over until, after their arrival in France, better steam winches were secured.

While these were the principal changes, they represented only a small part of the work to be done. All the electric-lighting and plumbing systems had to be rearranged and extended, coaling scuttles made water-tight, boat davits lengthened or replaced to suit larger Navy boats, berths installed, Navy messing and signaling arrangements fitted, the steering gear entirely remodeled, and additional mast stepped and a radio set put in. While all this was going on efforts were being made to learn something definite about the stability of the vessels. Finally a model representing one of the boats was obtained through Jackson & Sharp, builders, and the drafting room of the Norfolk Navy Yard at once began working night and day on the necessary calculations. Before these were finished, however, a definite but very unwelcome idea was formed as to the stability of the vessels, for in undocking a group of boats which had received their guns, gun foundations, and boat davits while in dry dock it was found that they were alarmingly tender, and several tons of ballast were put on board.

As soon as possible an inclining experiment was made, and working from this, the necessary ballasting was undertaken. But this extra ballast tended to reduce the freeboard, already small, and after a good deal of consideration a better distribution of ballast was found possible, giving the boats the minimum necessary freeboard, with ample stability when loaded and better freeboard with somewhat less stability when their coal and water was consumed.

Owing to the heavy loads imposed on these boats, they worked considerably and had a great deal of trouble with leaks, but finally 11 of them sailed for France and arrived safely. They were at first assigned to escort duty with convoys, but after one of them foundered in a storm it was decided to set them to work mine sweeping. As their 12-foot draft was considered excessive for sweeping, one gun and some ballast was removed to lighten them. They were also fitted with sweeping gear of French design, in which the boats sweep singly, towing the middle of a span which has a water kite on each end.

During the first part of their stay in France the constant discovery of leaks led to frequent requests for dry-docking and calking. In accordance with usual practice the dry-dock blocks were arranged with their tops in a level line, thus making no allowance for the fact that the boats were decidedly hogged. The result was to loosen up some of the calking and tighten up other parts of it, and the boats were recalced in this abnormal condition. When undocked, of course, they immediately tended to return to their original hogged condition, which slackened the seams that had been tight and tightened those which had been recalced, thus starting more leaks.

A few such experiences with these boats naturally led to very pessimistic reports against them, but just about this time one of the officers concerned in their repairs decided to revert to very old-fashioned methods, taking advantage of the great rise and fall of tide on the west coast of France, he landed one boat at high water on a mud flat, thus allowing her to cut into the mud as the tide fell and retain her water-borne shape. Then he went over the calking during the low tides, and when finally floated off the bottom the boat was found to be practically tight, and remained so.

In conclusion it may be said that the conversion of these miscellaneous vessels involved a great deal of work, with results that were necessarily unsatisfactory in some respects, and all who had experience with them looked forward to much better results from the mine sweepers regularly designed and built for the purpose.

NAVAL SALVAGE SERVICE.

In the latter part of 1917 it became evident that it would be necessary for the Government to take steps to supplement the salvage facilities of the private companies, due to the rapid increase in American shipping, practically all of which was operated under Government control. The Assistant Secretary of the Navy took up this matter and called a conference of representatives of the Departments of War, Commerce, Navy and the Shipping Board. The conference was held January 11, 1918, and included, besides the representatives of the Government departments concerned, representatives of the following salvage companies: Merritt-Chapman Derrick & Wrecking Co., T. A. Scott Wrecking Co., Inter-Ocean Co., Yankee Salvage Association.

It was clear that it was essential to the success of our overseas war effort to maintain adequate salvage facilities for all vessels entering and leaving American Atlantic ports. On account of the operation of the draft laws and the commandeering of floating equipment of all kinds by both the War and Navy Departments, it was evident that the existing salvage companies would be seriously crippled, if not actually put out of business; Government control of salvage appeared necessary.

In order to meet the situation it appeared that there were two courses open: First, to commandeer a portion of the plant of each one of the existing companies, or to commandeer one of the companies outright and organize it under Government control, leaving the remainder of the companies to pursue their work on this coast; or, second, to organize all of the existing companies under governmental control and expand from the ground up, using as a basis the existing organizations. After careful consideration of the question, it was decided that the second method was preferable, and the Bureau of Construction and Repair of the Navy Department was directed to make preliminary arrangements for the establishment of a naval salvage service.

At that time there were in existence only three commercial salvage companies with any extensive amount of equipment. These companies were the Merritt-Chapman Derrick & Wrecking Co., the T. A. Scott Wrecking Co., and the Yankee Salvage Association. After the conference, in the office of the Assistant Secretary of the Navy, representatives of the commercial salvage companies conferred and selected Mr. T. A. Scott as their representative. This gentleman cooperated with Capt. M. M. Taylor, of the Office of Chief of Naval Operations, and Capt. J. D. Beuret, of the Bureau of Construction and Repair; and as a result of their consideration of the question a report was submitted to the Assistant Secretary of the Navy, which in part is as follows:

"1. Following the conference held Friday, January 11, 1918, on the question of extending the salvage facilities of this country to provide for carrying on salvage operations in Europe the undersigned, in accordance with your instructions, considered the question further in conjunction with Mr. T. A. Scott, representing the salvage companies, and also discussed the matter with representatives of the Merritt-Chapman Co. and with representatives of three or four of the smaller companies, and submit the following report:

"2. The purpose of the department is understood to be to send abroad as early as practicable as many salvage units as can be manned and equipped by the use of equipment and personnel at present available, without reducing the salvage facilities in actual use on the coast of the United States; and to provide for sending abroad additional units as rapidly as vessels and equipment can be provided and personnel can be trained, this also to be without reducing the salvage facilities in actual use on the home coast. It is understood further that the personnel of all salvage units sent to Europe should be enrolled in the Naval Reserve, but that this is not considered essential for personnel operating on the home coast.

"3. We are of the opinion, as a result of the preliminary inquiries made, that four or five salvage units could be equipped and manned with trained personnel, as rapidly as vessels could be made available, without interfering to any material extent with the organization or operations of the salvage companies now in existence, the Government providing vessels now in the naval service or engaged

in other work and taking over from the salvage companies such equipment as they can spare without interfering with operations in hand or immediately in prospect.

"We understand, however, that the Navy Department contemplates placing in service a larger number of units than could be provided in this manner, and the manning and equipping of a large number of salvage units would involve a rapid expansion of the personnel engaged in salvage work, which would necessitate training new personnel for the work and would involve the purchase of a large amount of new equipment. As the personnel and equipment now engaged on salvage work are understood to be approximately adequate for the work in hand and in prospect, the training of additional personnel would necessitate either the taking over by the Government of the salvage facilities now in use or the close control of the operations of these companies and their compensation for the training of the additional men required. In addition it will be necessary to provide for the orderly manning of such additional units as may be equipped for foreign service, talking for this purpose from the personnel now engaged in salvage work or the new personnel trained for this service. We are of the opinion that to adequately meet all the conditions of this rapid extension of the salvage facilities it will be necessary for the Government to take over control of the companies and operate them as a military organization, enrolling in the Naval Reserve all of the men in charge and as many as possible of the men in subordinate positions, but it should be practicable to employ effectively on home work a certain proportion of men who may require to be retained in a civil capacity, due to their citizenship or other difficulties that might prevent their enrollment.

"4. If it is decided to extend the salvage work undertaken by the Government, as proposed above, we are of the opinion that this extension should be limited to what is necessary to meet the requirements of the situation abroad. In the case of the small companies, the personnel and equipment is engaged exclusively, or in great part, on salvage work, but in the case of the larger companies, a part of the personnel is engaged wholly or in great part in the handling of weights, transportation, and engineering work. We are of the opinion that it will be sufficient for the Government to organize for carrying on the coast salvage work, leaving work in inshore waters to be undertaken by private companies as at present. The line of demarkation between the work handled by the Government and the work handled by private parties, when the Government extends the salvage facilities at its command, will establish itself in the same manner as the line of demarkation between Government work and private work under present conditions—the Government undertaking such work as its facilities permit, and the remaining work being undertaken by private enterprise.

"5. Once the action to be taken by the Government is decided, compensation for the vessels and equipment taken over by the Government for use in salvage work can best be arranged by negotiations with each individual concern. So far as the question of compensation is concerned, the equipment in use divides itself into three classes: (a) Vessels and lighters; (b) permanent equipment, such as pumps, hoisters, etc.; (c) consumable equipment and supplies, such as hawsers, small tools, lumber, etc. Class (c) should be taken over by purchase outright. For classes (a) and (b), purchase outright, purchase with an option for repurchase by the present owner on the termination of the war, or a rental might be considered. Due to the possibility that the Government may continue handling salvage work after the termination of the war and to the fact that the proposed great extension of salvage facilities will profoundly affect conditions so far as concerns private companies, whether the Government remains in the business or not, it would appear that either purchase outright or purchase with an option for repurchase by the present owner will probably be the best method. This, however, is a question which affects the private companies more than the Government and considerable weight could be given to the wishes of these companies in the matter. It is noted that the taking over of the personnel and equipment, as proposed, will in all probability require the salvage companies to go out of business or to reorganize for the purpose of handling other work, and that it will be difficult and may be impracticable to reconstitute the business on the present line after the termination of the war. These conditions do not affect all concerns equally, but it will be necessary to consider them in adjusting the compensation arrived at for vessels and equipment taken over.

"6. Another matter that should be considered in connection with the taking over of salvage facilities by the Government, is the question of compensation to be paid by owners and insurers for salvage work undertaken. The rescue work now undertaken by the Government is without compensation, but it is questionable if such a procedure would be desirable after the change proposed above, at least for foreign vessels and until insurance could be adjusted to meet the change in conditions. Two methods of compensation might be considered: First, the payment for services rendered, on a day-rate basis, the rate being adjusted to cover the large overhead charges incident to this business; and, second, the payment for each job, of a sum to be determined by a board of arbitration on which representatives of the Government and of the owner or insurance company would sit. The latter method would cause least change in the present conduct of the business, but if it is considered that the undertaking of salvage operations by the Government is likely to continue for a considerable time, the former method would probably prove the more satisfactory.

"7 We are of the opinion that the most satisfactory method of handling the change if it is decided on, will be to enroll four or five experienced salvage men and call them to active service as early as possible, so that they may be used in connection with a survey of the situation abroad, with the enrolling of the personnel required for the proposed organization, with the arrangements for training additional personnel, with the listing of vessels and equipment now available, and with the ordering of such additional vessels and equipment as may be necessary. The personnel required for the organization should be enrolled in the reserve as rapidly as practicable, but the vessels and equipment should be taken over and the necessary personnel should be called to active service in such way and at such times as will permit the present companies to operate effectively until such time as each part of the work can be taken up by the Government.

"8. After considering the present organization of the business and the probable future needs, we are of the opinion that there should be established six home stations, one each at Boston, New London, New York, Norfolk, Key West, and the West Indies, and that arrangements should be made for equipping at least five units for foreign service as early as practicable. To provide for the training of personnel for manning the additional units for foreign service, which it is proposed to send abroad at a later date, the home stations should be manned with double force as rapidly as possible so that extra personnel may be available for the purpose."

The report was forwarded by the Assistant Secretary to the Secretary of the Navy with the following indorsement:

"Approval of the above general plan for taking over wrecking equipment and establishing a wrecking service on the Atlantic coast and in European waters under the Navy Department is requested.

"Referring to paragraph 6, in regard to the question of compensation to be paid by owners and insurers for salvage work undertaken by the Government, it is suggested that this matter be gone into carefully by the solicitor. In my judgment, the first method of compensation suggested is the best, i. e., that payment be placed on a day-rate basis, the rate being adjusted to cover the large overhead charges incidental to this business, including unsuccessful attempts at salvage, etc., in other words so that the Navy Department could place this salvage work on a self-sustaining basis as far as possible without, of course, any profit to the Government.

"The enrollment of officers suggested is very modest in its scope.

"It is important to get this work started as soon as possible by the immediate enrollment of the three or four men who are to cooperate with the Chief of Operations and the Bureau of Construction and Repair in organizing the work here and abroad."

Under date of January 26, 1918, the Secretary of the Navy approved the report and directed the bureaus of the Navy Department to take the necessary action to carry out the recommendations for establishment of a naval salvage service.

The first step taken by the Bureau of Construction and Repair in connection with the execution of the department's orders was to have enrolled as naval constructors in the reserve force the following persons: T. A. Scott, W. W. Wotherspoon, W. N. Davis.

Lieut. Commander Scott was placed in direct charge of the salvage work of the bureau, under the Maintenance Division, supervised by Capt. Beuret, and

arrangements were made to send Lieut. Davis and Lieut. Wotherspoon abroad for the purpose of investigating conditions to be met in connection with the work in European waters so that more complete information might be available in manning and equipping vessels for that service. Arrangements were also made to proceed with the listing of salvage vessels and equipment available, and for the enrollment of experienced personnel.

The organization established for salvage operations on the Atlantic coast was indicated in an order issued by the Secretary of the Navy as follows:

"For convenience in handling salvage operations by the Navy Department, the Atlantic and Gulf coasts and adjacent waters will be divided into three districts with permanent stations as given. Additional stations as may be necessary from time to time will be established by the Chief of Naval Operations on recommendation of the Bureau of Construction and Repair. The districts will be as follows:

"Northern district to include all the coast from the northern boundary of the United States to Shinnecock Light on the southern shore of Long Island, and Long Island Sound as far west as Bridgeport and Port Jefferson. The permanent stations in this district will be at New London, Conn., and Boston, Mass.

"Central district to continue from the southern limit of the northern district to the boundary line between Georgia and Florida. The permanent stations in this district will be at New York and Norfolk.

"Southern district to continue from the southern boundary of the central district to the southern limit of the United States and also the Gulf of Mexico and Caribbean Sea. The permanent stations in this district will be at Key West, Fla., and Guantanamo, Cuba.

"Salvage operations in each salvage district will be under the direction of the district salvage officer who will be ordered to report to the Bureau of Construction and Repair for this duty. The officers in charge of salvage stations will report to the district salvage officer and also to the commandant of the district in which the station is located. For administrative purposes the salvage stations with their personnel, vessels, and equipment will form a part of the district organization, but the movements of vessels and the handling of equipment in connection with salvage operations will be under the direction of the district salvage officer subject to the military control of the commandant of the district in which operating."

This order also contained instructions as to the steps that should be taken to insure prompt service and cooperation in the case of vessels reported in distress, and these were supplemented by the bureau in the following letter to district salvage officers:

"1. The bureau has selected for district salvage officers in the several salvage districts officers who have had long experience in salvage work, and desires to give them as much latitude as practicable in conducting salvage operations, subject to such supervision by the bureau as is necessary to apply most effectively all the facilities available.

"2. District salvage officers should keep in mind that the facilities under their immediate charge will not be sufficient to handle all salvage operations which they will be called on to perform. It is necessary that these facilities be supplemented at times by the other Government facilities that may be available and by private facilities when necessary. As the first step in making such facilities readily available, lists should be prepared of Government personnel, vessels, and equipment in the several naval districts, and of private personnel, vessels, and equipment in the several ports included in the salvage district which are suitable for work in connection with salvage operations, so that when additional assistance or equipment is needed the district salvage officer may know on whom to call.

"3. Salvage stations should be provided with the equipment and materials necessary for carrying on the ordinary run of operations. When additional material or equipment is required for a special job, it will be obtained when practicable from the most convenient naval supply officer. It may, however, be necessary in special emergencies to procure supplies or equipment without the delay that would be involved by purchase through the regular channels, and arrangements have been made with the Bureau of Supplies and Accounts to designate the district salvage officers special purchasing agents for that bureau for the procurement of supplies and the hire of equipment in an emergency. Such purchases or hire should be limited strictly to what is

actually necessary in an emergency, material and equipment being procured in the regular manner whenever possible.

"4. The district salvage officer will arrange for the keeping of a log of operations by the officer in charge of each operation, which log should be accompanied by such photographs as may be necessary to properly illustrate the character of the work, and by a list of expenditures, losses and damages. The log of operations will be submitted to the district salvage officer, by whom it will be forwarded to the bureau after being examined and checked by him.

"5. Commandants of naval districts have available facilities for obtaining and transmitting information of movements of vessels and other happenings in their districts. In order to make full use of these facilities the district salvage officer will place himself in immediate touch with the communication office located nearest his headquarters and will arrange for placing each salvage station in his district in close touch with the communication office nearest the station. It will be necessary for the district salvage officer to make arrangements for a continuous watch being kept in his office. The bureau is arranging to establish a continuous watch, which will be in immediate touch with the Communication and Ship Operations Offices of the Navy Department, so as to have available with the least possible delay all information of value in connection with salvage work and to permit ready consultation between the several districts and the bureau.

"6. The district salvage officer will ordinarily consult the bureau prior to making arrangements for assisting vessels in distress, but where consultation with the bureau would cause delay in proceeding to a vessel's assistance, he will himself take such steps as are immediately necessary. In the latter case he will instruct his office to immediately communicate to the bureau information of the steps being taken and will himself take the earliest practicable opportunity to consult with the bureau relative to the work.

"7. The attention of district salvage officers is especially invited to the necessity for keeping the commandant of each naval district fully informed of work under way in his district. Advance notification of proposed salvage operations will greatly facilitate the procuring of assistance from the commandant of the district and will frequently enable the commandant to arrange for such assistance being given where it would be impossible on a sudden call.

"8. The district salvage officer will take early opportunity to discuss in person with the proper representatives of the commandants of the several naval districts included in the salvage district the vessels and equipment most readily available for assistance in salvage operations, the best method of arranging for additional assistance when required, the best method of handling communications between the districts, his office and the several salvage stations, the character of the information which should be furnished relative to vessels in distress, and the arrangements practicable for furnishing expert advice in connection with emergency work that may be undertaken by vessels other than those assigned for salvage work."

The district salvage officers were:

Northern district.—(a) Boston headquarters, Lieut. R. S. Gardner; (b) New London office, Lieut. A. J. Davis.

Central district.—(a) Stapleton, Staten Island, headquarters, Lieut. Commander Walter N. Davis; (b) Norfolk office, Lieut. Commander H. R. Foster.

Southern district.—Key West, Fla., headquarters, Lieut. Commander John Johnson.

European district.—Brest, France, headquarters, Lieut. Commander W. W. Wotherspoon.

In addition to commandeering the salvage equipment, including vessels belonging to the largest salvage companies, arrangements were made to enroll former employees of these companies in the Naval Reserve Force as officers or enlisted men in ranks and ratings as best qualified. These men formed the greater portion of the naval salvage service. Additional personnel for the salvage vessels and stations was obtained by enrolling in the reserve force specially qualified civilians and by detailing for that duty certain Regular Navy men who were especially fitted for salvage work, such as gunner's mates with diving experience.

Salvage equipment belonging to the Merritt-Chapman Derrick and Wrecking Co., the T. A. Scott Wrecking Co., and the Yankee Salvage Association was commandeered by the Navy Department and ultimately paid for as follows: \$1,430,000, to Merritt-Chapman Derrick and Wrecking Co.; \$150,000, to T. A. Scott Wrecking Co.; \$250,000, to Yankee Salvage Association.

This material was drawn upon to equip the several home salvage stations and vessels as well as the foreign salvage unit, the U. S. S. *Favorite*, a vessel specially designed for salvage, and selected as the most suitable for work abroad. This vessel sailed for Europe June 7, 1918, in command of Lieut. Sloan Dannenhower, U. S. N. R. F., an experienced wrecker, and arrived at Brest early in August, 1918, by which time the three home districts had been fully manned, equipped, and in efficient operating condition.

The salvage equipment commandeered from the commercial companies included the salvage steamers *Relief*, *Resolute*, and *Rescue*, the tugs *Macomber* and *Casco*, and the derrick lighters *Salvor*, *Addie*, *Chittenden*, *Seymour*, and *Sharp*. In addition the steamer *Biesboch* was obtained from the Shipping Board and fitted as a salvage vessel and the Coast Guard cutter *Acushnet* was assigned to salvage duty. The steamer *I. J. Merritt*, which was under construction as a salvage ship was also commandeered and work continued by the Navy Department, but had not been completed at the time the naval salvage service was demobilized. The same was true of the steamers *Chesapedke* and *Manna Hata*, which were commandeered by the department on August 31 and September 7, 1918, for fitting out as additional units for European service. These vessels were ready, however, in time to sail for Brest in May, 1919, the foreign salvage being continued through the summer.

As already indicated, the *Favorite* was the first salvage vessel sent abroad, arriving in Brest on August 5, 1918. On August 6, 1918, Lieut. Commander Wotherspoon assumed duty as force salvage officer in France, and on September 4 Commander C. W. Fisher, C. C., reported as force naval constructor, his duties including matters pertaining to salvage.

Salvage operations abroad had practically ceased by the end of August, 1919, having been continued in the meantime on the basis of a cablegram from Admiral Benson in January, that "It would be inconsistent for us to discontinue salvage service while large numbers of Government vessels are operating to and from French ports," during which period "it is not unlikely that on account of reduction of escort vessels and piloting vessels, the number of groundings and injuries from collision may be considerable." Following are extracts from a report forwarded by Commander Fisher on September 1, 1919:

"Immediately upon her arrival in France, the U. S. S. *Favorite* found work and plenty of it, and was in fact kept continuously occupied up to the date of her departure.

"The first step was to establish a base, or combined storehouse and barracks where excess personnel could be housed and where gear could be overhauled without interfering with the continual state of readiness for an emergency, which is, of course, essential for a salvage and rescue vessel. There was a considerable quantity of excess gear on the U. S. S. *Favorite*, because she had brought over to France salvage equipment to be used on the vessels that were to follow her. Furthermore, in anticipation of the arrival of the other vessels, the salvage division immediately took steps to procure from England, a complete outfit of electric submersible pumps for driving by alternating current and direct current, a number of Allen centrifugal pumps, additional diving apparatus of the most modern type and the necessary suction and discharge hose with other fittings, to provide complete outfits for each of these vessels. No suitable space on shore being available for the storing of this material, the hull of an old composite French warship, the *Romengol*, was moored in the inner harbor, the U. S. S. *Favorite* tied up alongside, and the *Romengol*, in a short time converted into the semblance of a floating base, in which were stored boilers, pumps, hoisting engines, diving gear, hawsers, and bench gear; and a very complete stock of spare suction, elbows, flanges, foot valves, lumber, and other miscellaneous material. In addition, a small workshop was built on deck, and the after portion was fitted up for berthing and messing about 20 men. A very complete photographic dark room was also installed. The work required was considerable because the *Romengol* leaked through the bottom, the sides, and the decks—in fact, it was necessary to practically rebuild the upper deck and to materially strengthen the 'tween deck. The hull at all times leaked to such an extent as to justify the installation of a special pump. Notwithstanding these inconveniences, the old *Romengol* proved to be an invaluable asset to the salvage division.

"The U. S. S. *Favorite*, in addition to her radio equipment was equipped with radio telephone, and was thus, at all times in close communication with the port office and the flag at Brest, which in turn was in radio or telephone communication with practically the whole west coast of France, so that a

salvage vessel could be gotten under way within one hour after receipt of news of a wreck. In addition to the U. S. S. *Favorite*, two of the best seagoing tugs stationed at Brest were always held available as rescue vessels to proceed to the scene of disaster for rendering first aid, and for the rescue of personnel. Additional rescue vessels in the form of destroyers were also available during the time these boats were stationed at Brest.

"The organization for salvage work was simple, but effective. The first salvage division, as it was called, operated directly under the flag, and the force salvage officer directed its general conduct, being responsible for the efficiency of the division as a whole, the selection of salvage vessels for particular salvage jobs, and the general methods to be pursued in each case. The wreckmaster of each salvage vessel was in direct charge of all actual salvage work, and was given full authority over the vessel in distress from the moment of his arrival. He was also empowered to call upon all branches of the United States Navy for such assistance as he might require. The commanding officer of the salvage vessel, so far as concerned actual salvage work, was subordinate to the wreckmaster. The force naval constructor acted as the representative of the flag in matters pertaining to salvage, especially the repairing and docking of salvaged vessels.

"Upon the departure of the force salvage officer of the United States the force naval constructor was given this duty in addition. The responsibility of the salvage division ceased when the damaged vessel was delivered in a floating condition in harbor or at a dry dock, but as a matter of fact, due to the excellent repair facilities on board the U. S. S. *Favorite* and the ability of her personnel, it frequently completed the necessary repairs after the actual salvage. No distinction was made in regard to ownership of vessels needing assistance. On account of the lack of French salvage appliances the First Salvage Division rendered aid to any vessel in difficulties no matter what her nationality.

"When fully equipped, there is no doubt, that the U. S. S. *Favorite* was the best equipped salvage vessel in the world, and that her compressed air arrangements were far in advance of anything owned by foreign nations.

"In order to care for the numerous small pumping and diving jobs, especially those in shallow water, the steamship barge *Frieda*, which had been obtained for harbor work in Brest from the British Admiralty, was, in September, 1918, turned over to the salvage division and fitted with one Schramm air compressor, one straight-line air compressor, one 6-inch Worthington pump, three or four diving outfits, and a hoisting boom on the foremast with a capacity of about 1 ton. The *Frieda* is what is known as a 'Liverpool lighter,' with about 6-foot draft and about 100 feet long, single screw, steam driven, with the machinery in the extreme after end of the boat, thus rendering the whole forward part available for cargo hold or salvage gear. With a crew of a chief petty officer in command and five men, the *Frieda* has operated on the average of 12 hours a day, and has proved herself to be one of the best small auxiliary salvage units in existence. She has even been towed by the U. S. S. *Favorite* as far south as La Pallice, and has worked in St. Nazaire and Quiberon Bay, in places where the depth of water was too small to permit the U. S. S. *Favorite* to enter. Her principal service has, however, been that of a diving boat wherein she had become an expert in the replacing of ship's propellers under water, and that of keeping the numerous harbor craft in Brest free from water. The *Frieda* has been in salvage service since September, 1918, and will probably be one of the last salvage units to be disbanded.

"Notwithstanding numerous urgent telegrams for additional salvage vessels it became evident that no additional units would arrive from the United States until the spring of 1919. Steps were, therefore, taken to increase the salvage division by utilizing available vessels in Europe.

"The first of these was the U. S. S. *Victorine*, ex-*Utozana*, a steel, single screw mine-sweeper, that had operated out of Lorient during the war. She was approximately 124 feet long, with a 24-foot beam, but had the disadvantage of drawing about 15 feet. She had previously been fitted as a fishing boat on the Atlantic coast of the United States. In February, 1918, she was assigned to the salvage division; part of her deckhouse, aft, was cut away; heavy towing bits installed in this location; the crew's galley moved forward; magazines and holds cleared out for additional personnel and for salvage gear; and a turbo-generator set installed in the engine room for providing submersible pumps. These alterations, together with the placing on board of such salvage gear as her size would accommodate were completed about the middle of March, 1919, and after a few small jobs in Brest, she was, on April 5, 1918, sent to St.

Nazaire as salvage vessel for that district. Her operations from then on comprised miscellaneous work at the mouth of the Loire; the recovery of sunken coal barges near Bordeaux, in the Gironde River, and miscellaneous work along the coast. As American sailings decreased her work fell off, and on July 11 she was returned to Brest, finally sailing for the United States, via the Azores, on July 25, 1919.

"It became evident about the 1st of October, 1918, that if the war continued and the United States shipping continued in the Mediterranean, it would be necessary to have an effective salvage unit in those waters, because, though the Italians had contemplated rather elaborate plans for ship salvage, they had not succeeded in placing in operation any salvage vessels. Although it was desirable to have two vessels, one in Italian waters to handle also the work in the Levant, and another at Gibraltar, it was possible to obtain one vessel only. On account of the fact that most of the submarine activity was in the vicinity of Gibraltar; and furthermore, that our largest naval base in the Mediterranean was located there, it was decided to make Gibraltar the salvage base for the Mediterranean.

"Accordingly, after consultation with Admiral Niblack at Gibraltar, the U. S. S. *Seneca*, an ex-Coast Guard vessel, was sent to Brest on January 5, for transformation into a salvage vessel. On her way up she was stopped to assist in the investigation of the wreck of the *Tenadores*, off the Ile de Yeu, after which she assisted in the salvaging of the U. S. S. *Appelles* in Quiberon Bay. The alterations consisted in cutting away the deck house aft and installing towing bits and the placing on board of the usual salvage equipment of hawsers, anchors, pumps, diving gear, etc.

"The U. S. S. *Seneca* was completed about the end of March and took station at Gibraltar. Her work in the Mediterranean was finished in May, and on May 10, 1918, she arrived in Brest, had her salvage equipment removed, and was placed on other duty, finally departing for the United States on June 17, 1919.

"The U. S. S. *Manna Hata* arrived after practically all important salvage work in sight had been completed, and the necessity for maintaining a salvage section was only dependent upon the casualties that might occur among the transport and cargo vessels belonging to the United States. The *Manna Hata* is a better seaboat than the *Favorite*, but her hoisting capacity is much less, being only 8 tons forward and 4 tons aft. Aside from this lack, she is a very efficient salvage vessel, completely equipped with salvage gear, and has, in addition, fine standard workshop installed on the 'tween decks aft, comprising seven or eight belt-driven machine tools with workbenches, hand tools, etc.

"The U. S. S. *Chesapeake* is a sister ship of the *Manna Hata* and arrived simultaneously with that vessel. There not being sufficient work to require both vessels, on August 3, 1919, the *Chesapeake* left Brest to form part of the mine-sweeping force at Kirkwall, Scotland.

"During all of the operations of the first salvage division in Europe, the activities of Lieut. Commander W. W. Wotherspoon were felt. By virtue of his long experience in salvage work, and his energy, he can be considered largely responsible for what success the salvage division has had, and to him unquestionably belongs the credit for the successful working out of the organization, the obtaining of the necessary material from England and the United States to complete the equipment, and the logical distribution of this material among the vessels of the division. Lieut. Commander W. W. Wotherspoon was personally engaged in every important job handled by the division and deserves particular credit for his courage in recovering the body of a sailor who had been overcome by smoke and fumes in a dangerous fire on one of the vessels salvaged by the first salvage division."

"It must be borne in mind that in addition to the work listed, the salvage division was continuously occupied in handling heavy weights, assisting in harbor movements, helping out in repair jobs, and in general holding itself at all times in readiness to proceed to the scene of a possible wreck.

"The work of the first salvage division in Europe has unquestionably demonstrated the desirability of Government operation of salvage vessels, in that the cost of the salvage work performed to the United States Government, even including the value of the vessels themselves and their alterations, is undoubtedly 50 per cent less than the charges that would be made by commercial concerns. As a measure of war preparedness, it is submitted that the maintenance by the United States Navy of one or two complete salvage units has been proved ex-

tremely desirable, and it is hoped that the record of the first salvage division will assist in attaining this end."

At the date of the signing of the armistice, vessels of the naval salvage service were assigned as follows:

Boston, Mass.: *Acushnet*, Coast Guard cutter; *Salvor*, derrick lighter.

New London, Conn.: *Macomber* and *Casco*, tugs; *Addie*, derrick lighter.

New York, N. Y.: *Relief* and *Resolute*, salvage steamers; *Crittenden* and *Seymour*, derrick lighters; *Superior*, schooner.

Fitting out for general service: *I. J. Merritt*, salvage steamer.

Fitting out for European service: *Chesapeake* and *Manna Hata*, salvage steamers.

Norfolk, Va.: *Rescue*, salvage steamer; *Sharp*, derrick lighter.

Key West, Fla.: *Biesbosch*, salvage steamer.

Brest, France: *Farorite*, salvage steamer; *Victorine* (formerly *Utowana*), yacht; *Freida*, steam barge; *Seneca*, Coast Guard cutter.

The naval salvage service was operated on a commercial basis in accordance with authorization contained in naval act of July 1, 1918, which provides as follows:

"That hereafter the Secretary of the Navy is authorized to cause vessels under his control adapted to the purpose to afford salvage service to public or private vessels in distress: *Provided*, That when such salvage service is rendered by a vessel specially equipped for the purpose or by a tug, the Secretary of Navy may determine and collect reasonable compensation therefor."

There is appended a statement of vessels in United States waters for which salvage service was furnished during the period of naval operation, and also of the operations abroad. The approximate cost of all service in home waters to May 15, 1919, was \$407,000, which covers the cost of operating the vessels when actually engaged in rendering assistance, together with cost of equipment expended. The compensation received for such services on merchant and Shipping Board vessels was about \$426,000.

The naval salvage service in United States waters was demobilized May 15, 1919. On this date all naval salvage vessels and the salvage equipment afloat and ashore in the United States were returned to the T. A. Scott Wrecking Co. (who also represents the Yankee Salvage Association), and the Merritt-Chapman Derrick & Wrecking Co. The *Manna Hata* and *Chesapeake* were sold abroad and the barge *Freida*, which had been chartered, was returned to her owners during October, 1919, the hulk *Romengol* having previously been turned back to the French Government.

MARINE CAMOUFLAGE.

Steel vessels of the United States Navy, which were originally painted white as a matter of habitability and appearance, were given a "war color" at the beginning of the conflict with Spain, in 1898, to decrease their visibility, and the question as to the best color for such purpose was considered from various viewpoints and under varying conditions during the years that followed. Different shades of gray, varying from light fog color to dark slate, were experimented with, but the shade which might seem to afford the best protection under certain conditions of atmosphere, sea, and background would appear less effective under somewhat different conditions, and the official gray color, although standardized, was changed slightly from time to time during the 18 years that followed. In later years torpedo craft were painted various shades of green, some nearly black, to decrease the visibility of such types, more particularly for night work, exposed to searchlights. Although standard paints were issued ready mixed to the fleet, the results obtained were never altogether uniform, due, in part, to the darkening of the gray shades with the lapse of time following application.

In the late nineties the Germans decided to paint their vessels dark gray, and Great Britain changed from black to gray about the same time, also using a darker shade than the American standards. Other navies, including the French, Austrian, and Italian, adopted standard colors, which might be generally described as a mixture of gray and khaki.

Early in the World War it was realized that the great problem was to frustrate attacks by submarines, merchant shipping being their particular prey, and that this must be accomplished by deception or "camouflage," rather than by attempting to reduce visibility. The method adopted by the British, after much study and experiment, was termed the "dazzle" system. It was not until the spring of 1917, however, that the dazzle branch of the British Admiralty was definitely organized, in charge of Lieut. Commander Norman Wilkinson, R. N. V. R., who had made a comprehensive report on the subject,

with recommendations which were approved by the Admiralty. This officer later visited the United States, at the request of the Navy Department, as referred to below, and his recommendations were also taken up by the French.

A report of Lieut. Commander Norman Wilkinson, R. N. V. R., Rear Admiral Greatorex, R. N., July 16, 1917, states that the painting of merchant vessels—

"Is based on the general assumption that it is impossible to obtain invisibility at sea, especially where, as in the case of an attacking submarine, the object is seen against the sky, with practically no sea to form a background.

"A submarine on the lookout for enemy ships will in all probability locate a vessel by her smoke, even when hull down, so that no color scheme aiming at invisibility is likely to save a vessel from attack. Again, where the vessel is hull up, or within attacking range, she is a definite shape with no deception as to her course, when painted an even tone all over, whatever the color used.

"Therefore the only course is to paint her in such a way as to deceive the attacker as to her size and course; this can only be done by extreme contrasts of color and shapes, which will so distort the vessel as to destroy her general symmetry and bulk.

"The pattern must not be too small, or the results will be negligible at a short distance, nor too big, as in the latter case large portions of the vessel will be definitely shown.

"A mean between these two extremes must be arrived at which will have the desired effect.

"The size, length, and bulk of the vessel to be painted must be considered when designing a color arrangement for her.

"These conclusions have been arrived at as a result of many years of observation of the effect of light and color on ships at sea and extensive experiments during the present war."

In transmitting this report to Admiral Sims, Admiral Greatorex repeats the general assumption laid down by Commander Wilkinson:

"The scheme is based upon the fact that:

"1. Invisibility can not be attained.

"2. The background of a ship seen through a periscope is always the sky.

"3. Deception as to course the ship is the 'raison d'être' as indecision in the submarine commander's mind must mean delay in getting in her short and possibly faulty aim.

"4. If one ship only is missed in consequence the scheme is justified."

The above was submitted to the Navy Department, August 17, 1917, by Admiral Sims with the following comment:

"Thorough investigation has indicated that it is impossible to render ships invisible on account of the varying background and as regards submarines on account of the fact that the sky, and never the sea, is the background of any object seen by a submarine.

"The problem confronting a submarine, once his prey has been sighted, resolves itself solely into estimating course and speed of the target, in order to determine how the approach to torpedo fire position should be made. The 'dazzle' system of painting is based on this one consideration and that is, of rendering the problem confronting a submarine commander more difficult, confusing him as to how his approach shall be made and thereby adding in some degree to the safety of the vessel attacked.

"It has now been definitely decided to paint all British-merchant ships in accordance with this scheme as fast as they become available in British ports. Also all armed merchant cruisers and auxiliary escort ships, will be painted as rapidly as possible.

"It has been recommended that all British destroyers used for escort work be similarly painted, and I have directed that some of the United States destroyers engaged in escort duty based on Queenstown, be painted at once in order to obtain their opinion as to the efficiency of the scheme."

The same line of argument was contained in a French Daily Bulletin of Submarine Warfare, No. 7, August 19, 1917, as follows:

"In order to render attack by the torpedo more difficult, the submarine must also be deceived as regards the speed and the angle of bearing of the ship. This can be accomplished by extreme contrasts of form and color, which destroy symmetry and the appearance of the silhouette. The deception can be rendered still more complete by the addition of smokestacks and other artificial constructions placed in such a way as to give the vessel a more pointed appearance than it really has.

"Vessels which have only one mast and one smokestack, both of which are vertical, are more difficult to attack than those which have two."

The files of the Bureau of Construction and Repair show that a scheme of "protective coloration" for ships was suggested in 1899 by Robert De Forest Brush, and the subject was revived several times during the following 10 or 12 years. The system proposed was one of countershading to decrease visibility and did not appear to offer any very promising results. It was taken up again by Mr. Jerome Brush at the opening of the war, and a number of vessels were painted under his direction to represent various modifications of the system.

Other systems for painting were proposed at the declaration of war, some by prominent artists who became interested in the subject. Five systems which appeared to possess the greatest merit were given the approval of the Shipping Board and were recognized by the Bureau of War Risk Insurance of the Treasury Department, which authorized a reduction in premiums where any one of the systems was applied. These included in addition to the Brush the Mackay, Herzog, Toch, and Warner systems.

Mr. William Andrew Mackay had first taken up the subject with the department in 1915, and his system, which was intended by the use of different color tones to decrease the visibility of portions of the ship, leaving other parts visible, with a deceptive outline, was extensively applied in the early periods of the war. The systems developed by Mr. Lewis Herzog and Dr. Maximilian Toch also tended, the first by a curvilinear combination of colors, countershading, etc., and the second by a ruptive design of broad bands of varying color and curvative, to reduce visibility. The system of Mr. Everett L. Warner, submitted in the fall of 1917, was intended to confuse an observer by using large diagonal and triangular patches, irregularly placed, depending not so much upon colors as upon the contrast of light and dark.

The Watson system, developed by the master painter of the Norfolk Navy Yard, was also based upon his observations of vessels visiting that vicinity and aimed also at confusion rather than invisibility. This scheme was tried out to some extent, as were many others, but the expression of opinion from various sources were too conflicting to permit very definite conclusions, especially on account of the frequent changes in assignment of vessels to which the experimental schemes had been applied and the lack of opportunity for making directly comparative tests.

These developments continued through 1917. The question was given much consideration by the naval consulting board and by the "Submarine Defense Association," in connection with which an elaborate series of tests were undertaken at the laboratory of the Eastman Kodak Co., through the courtesy of its president. There were frequent conferences between representatives of the Navy Department and Shipping Board, which resulted in the establishment of a fairly definite policy as regards camouflage by the end of the year. A summarization of the situation may be found in the following letter, addressed to the Secretary by the Bureau of Construction and Repair on January 18, 1918:

"For many months past the bureau has been testing various schemes of camouflage painting. During this period many suggestions have been received from artists throughout the country and many reports on observations of camouflaged vessels have been received. The bureau has also received reports from Vice Admiral Sims relative to the British 'Dazzle' system of camouflage.

"The question of camouflage painting has been recognized as one of importance, but, in view of the many conflicting ideas and the impracticability of obtaining definite reports of observations made on camouflaged vessels, decision as to the best system or systems has necessarily been delayed.

"The several systems that have been proposed may be classed broadly under two heads. One which has as its basic idea obtaining invisibility or reducing visibility, and the other with the basic idea of confusing or dazzling an observer. The Mackay system is probably the best-known type of the first, and the Warner (American) and 'Dazzle' (British) the best-known of the second.

"In the endeavor to reach a definite conclusion as to what should be done in connection with camouflage painting, the bureau recently conferred with the Emergency Fleet Corporation of the Shipping Board and certain tentative conclusions were reached, as follows:

"(a) The development of camouflage system and of experimental and research work in connection therewith to be undertaken by the Navy Department.

"(b) General charge of camouflage work, and particularly the application of camouflage as developed by the Navy Department, to be under the direction of a man to be appointed by the Shipping Board, working jointly with the Navy Department and the Shipping Board.

"(c) That the British Admiralty be requested to detail Lieut. Wilkin-on, the developer of the British 'Dazzle' system, for temporary duty in this country to assist in the organization of experimental and working forces."

"In order that the bureau may proceed with camouflage development, the department's approval of the general outline given above is requested."

The department approved the above recommendations under date of January 21, 1918, and made request for the services of Lieut. Commander Wilkinson, who arrived in this country in the latter part of February and remained throughout the month of March. Papers which he had prepared explaining his theories and systems were read by him in Washington, and later at the navy yards Norfolk, Philadelphia, Boston, and New York, before officers and others concerned. He described in detail the organization of the British office, together with the methods of design, apparatus used, etc. A camouflage section had in meantime been organized by the bureau, with Lieuts. Harold Van Buskirk, Lloyd A. Jones, and Everett L. Warner as a nucleus of its organization, and Mr. Wilkinson helped materially in starting the actual work of designing, and on the establishment of standards for the Navy's organization to meet or, if possible, excel.

It was during the latter part of February, 1918, that the first appointments of officers for carrying on this work were made, but it was not until about March 15 that the preliminary work of fitting up offices and the obtaining and building of equipment was definitely started. This date also approximately marks the initial issuance of a design by the newly formed department.

The Camouflage Section was placed in the Maintenance Division under the supervision of Capt. Beuret, although the preliminary work was supervised by Capt. Du Bose.

The organization as developed at that time is outlined in the following memorandum of March 15, and is the one maintained throughout the course of the work:

"1. The Camouflage Section of the Maintenance Division of the bureau will be under the direct charge of Naval Constructor Van Buskirk.

"2. There will be two divisions of camouflage work: one, design, under the supervision of Naval Constructor Warner, and the other research, under the supervision of Naval Constructor Jones.

"3. The headquarters of the design subsection will be in Annex A, Bureau of Construction and Repair, Navy Department, Washington, D. C. The headquarters of the research subsection will be at the research laboratory of the Eastman Kodak Co., Rochester, N. Y.

"4. The design subsection will prepare designs, transfer the designs to models, and prepare type plans from approved models. This subsection will also have charge of the force employed in copying or duplicating type plans.

"5. The research subsection will have charge of all original investigation in connection with new systems of camouflage that may be proposed, as well as special investigation of the theoretical value of the 'dazzle' system.

"6. The work of both subsections is to be under the general supervision of Naval Constructor Van Buskirk, who will give special consideration to administrative questions in connection with the camouflage organization. He will keep in the closest possible touch with the camouflage section of the Emergency Fleet Corporation and will prepare all general instructions relative to the technical side of camouflage for transmission to the Shipping Board. He will also pay particular attention to special tests that are ordered on vessels of the fleet, either naval or commercial."

In the meantime Mr. Henry C. Grover was appointed by the Shipping Board to carry on its portion of the work, and he, in turn, appointed district camoufleurs in the principal ports to supervise the application of designs.

The Army, which had started a small organization of its own under Lieut. Pavla for painting vessels which it was operating, agreed to place the work under the supervision of the Shipping Board district camoufleurs, with designs to be prepared by the Navy in conformity with the general practice that had been established, the personnel of its organization being also placed at the disposition of the bureau and the Shipping Board. Arrangements were likewise made to take care of vessels operated by the Railroad Administration, so that

finally all vessels leaving American ports were painted in accordance with designs prepared by the camouflage section.

During the early activities of the section considerable time was spent in getting the necessary data together for making the models and the outboard drawings of the vessels to be camouflaged. Arrangements were made with the Geological Survey to do all necessary photography and lithography in connection with the work.

The number of vessels to be painted grew to such proportions that a method of priority was necessary.

On May 31, 1918, it was decided to govern the camouflage painting of all vessels according to the following procedure (bureau letter No. 18030-A1, May 31, 1918, to the Chief of Naval Operations):

"(a) All troop transports should be camouflage painted, being given precedence over all other vessels in the preparation of designs.

"(b) All destroyers and all cargo and supply vessels operating in the war zone should be camouflage painted as rapidly as practicable.

"(c) Cruisers and gunboats should be camouflage painted, the preparation of these designs to be undertaken as rapidly as practicable, while giving the two preceding classes precedence.

"(d) For the present no camouflage designs should be prepared for battleships, except in special arrangement with the commander in chief for experimental work. The operation of these vessels as a fleet nullifies the effect of the designs in deceiving an observer as to the course and speed of the vessels. Tests for antirange finding camouflage are soon to be held on battleships of Force 1, and on completion of these tests the painting of battleships will be given further consideration."

In accordance with the above, a priority list was made at the beginning of each week showing the designs to be made, the outboard plans to be drawn, the models to be constructed, and the lithographs to be issued for the week following. In this way it was almost possible to keep up with the demand.

Approximately 1,256 vessels were camouflage painted after March 1, 1918. Following that date 96 American steamships were sunk, 18 of which were camouflaged. Of the 18, 11 were sunk by torpedo, 4 by collision, and the remainder were mined. This means that less than 1 per cent of the vessels painted were sunk by torpedo. It is of special interest that no vessel was sunk which had been painted at a navy yard after a special study of its particular model. All of the 11 vessels sunk by torpedo had lithograph designs prepared by the Navy and issued to the Shipping Board for application.

British statistics appear to indicate that in the first quarter of 1918 the percentage of attacks which resulted in either loss or damage was actually greater in the case of dazzled vessels, compared with those of ordinary type, whereas in the second quarter the advantage was in favor of the dazzled vessels by nearly 10 per cent, which would seem to show increasing efficiency of designs. The confusion caused by dazzle painting was very apparent in the navigation of vessels at close quarters, and to decrease the chances of collisions in entering and leaving port vessels in the transport service were repainted normally as soon as possible after the armistice.

The opinion of British submarine commanders, as quoted by Admiral Sims, in the fall of 1917 was that the chances of successfully torpedoing a vessel would be reduced 30 per cent by dazzle painting. On the other hand, an opinion volunteered by the commanding officer of the German *UB-55*, according to a report quoted by the Office of Naval Intelligence in the early fall of 1918, was to the effect that dazzle painting was of no value in the daytime, but might mislead an inexperienced officer attacking at night. It is considered beyond doubt, however, that camouflage painting was of distinct value, particularly in the case of large and fast vessels, which might be saved from disaster by the momentary confusion of the attacking submarine commanders, making it necessary to increase his own danger by a longer exposure of the periscope in taking observations. This appears to have been the opinion of some of our own submarine commanders, who had opportunities to observe through their periscopes the effect of camouflage painting on friendly vessels. It may be noted, in this connection, that the German submarine commanders appreciated the value of camouflage for their own vessels, and used various methods of decreasing visibility, both as to periscopes and of the vessel as viewed from the air.

The painting of submarines had to be governed with a view to reducing visibility from overhead when submerged and for ordinary observation on

the surface or partly submerged. The effects observed on foreign vessels, including German boats, as reported, were various, but the results of the bureau's consideration led to the adoption of black for horizontal surfaces, as viewed from above, standard gray for approximately vertical parts of the hull, and a light blue-green-gray for the conning tower, bridge, periscope, and fairwaters. The use of reactive paints and recognition marks for submarines, to prevent their being mistaken for enemy vessels, was developed with considered success.

Experiments with vessels smaller than destroyers, such as the Eagle boats, mine sweepers, and subchasers, led to the conclusion that in service a single low visibility color would be advantageous, as they were more subject to attack by gunfire than by torpedo.

In the case of vessels of the fleet it was established that dazzle painting would be objectionable for vessels of the line, for obvious reasons, while of advantage for vessels operating singly. The lighter grays used as standard prior to the war still appear to be the most effective in lessening visibility of fleet units, including destroyers, improvement having been observed in graduating from a somewhat darker shade at the water line to a very light gray at the top of the masts, to increase the difficulties of range finding. Experiments with rigging and painting, saw teeth, checkerboard designs, white bands, etc., on turrets, stacks, boat cranes, and masts appeared to show little, if any, advantage in that respect. Weather conditions in the war zone, and particularly in the North Sea, made accurate range finding difficult and low visibility of fleet units desirable. Following are the more important conclusions of the commander in chief from his letter of June 2, 1918:

"At short ranges there are innumerable objects aboard ship that can be used for range targets and the breaking up of all their lines is entirely impracticable.

"The topmast is the best range target for medium ranges, but it disappears at longer ranges and can not be used. However, there are many other objects which can be used at medium ranges, and the rigging on masts and stacks does not even prohibit the use of those targets by experienced range finders. The rigging presents a little difficulty at first, but this is soon mastered.

"The rigging on masts and stacks blends at the longer ranges and its edges appear as a fair line. Consequently, it does not interfere with range finding at the longer ranges.

"It is possible the enemy is now using stereoscopic range finders, in which case rigging is believed useless.

"The rigging on masts interferes at times with the hoisting of flag signals.

"The topmast does not materially assist range finders in securing ranges, because other targets are available.

"As a whole, the rigging on masts and smokestacks is not of sufficient value to warrant its use, and the striking of top masts is not warranted.

"The problem of camouflage for vessels operating in the fleet is different from that of vessels operating singly. It would probably be no use to give a wrong idea of the course steered by a vessel operating in formation, and certainly it would not be worth while to do so, if so doing would greatly increase a vessel's visibility. A gain in invisibility, or a confusing of the enemy's range finders, is however most desirable.

"In the fleet all vessels must be painted alike in order to make the designation of any particular vessel difficult.

"Strips of white on hull should be avoided in any form of camouflage, as being highly visible.

"In general, all the types of camouflage tested must be considered as facilitating range finding, as compared with the standard light gray, for all rendered ships visible at a greater distance than did light gray and consequently increased the range at which range observations could be made."

PARAVANES.

Probably the most secret and mysterious as well as most successful new device used by the allied navies in the war with Germany was the paravane.

Paravanes were invented and developed by Commander C. D. Hurney, Royal Navy, for the protection of vessels from moored mines. The very nature of the device and its object made its success dependent to a great extent on the maintenance of secrecy in all matters pertaining to it. Therefore throughout the war every precaution was taken by the allied navies to keep information

regarding paravanes confidential. In fact, it was a rule of the Navy Department, that the word "paravane" should not be spoken on the telephone, or written in dispatches, and all correspondence on the subject was kept in a confidential file.

The principle of a paravane installation is an individual mine sweep for each vessel. From a special fitting on the forefoot of the vessel is towed on each side a torpedo shaped body called a paravane, so designed that it stands out at a considerable distance from the side of the ship, and also travels at a definite depth. It has a large plane, slightly curved, like the wing of an aeroplane, which acts on the water like a kite on the air. This plane runs in a vertical position, and tends to pull the paravane away from the ship. This action throws a considerable strain on the towing rope which transmits the load to the ship.

The towing ropes, attached to the special fitting on the forefoot, perform two important functions. The first of these is towing the paravane. The second and more important is the sweeping operations, as the two ropes leading aft and outward from the stem form a wedge, at the apex of which is the forefoot of the vessel. This wedge formed by the towing ropes engaged the mine moorings and deflects the mine and moorings away from the ship out to the paravane.

At the point of attachment of the towing rope to the paravane is what is called the cutter head, containing jaws of steel saw-teeth knives. The mine mooring, when engaged by the towing ropes, slides into these jaws, where it is quickly severed, and the mine being buoyant comes to the surface where it can be seen and destroyed.

At the time the United States entered the war the Bureau of Construction and Repair was experimenting with a device similar to paravanes in the model basin at the Washington Navy Yard. However, as reports were received from the naval attaché at London that the British Admiralty were fitting out their naval vessels with a mine-protective gear, it was decided to request drawings from the Admiralty and permission to use them in this country.

In May, 1917, the working drawings of paravanes were received from the British Admiralty. At the same time the Navy Department was asked to agree to pay such royalties to the inventor as the Admiralty should decide to be suitable, and also to maintain strict secrecy in regard to paravanes and their purpose. These arrangements were made by cable, and further cablegrams were exchanged in regard to the proved value of paravanes, and it was not until May 28 that the Navy Department received a cablegram which contained definite information as to the established value of paravanes. It was then decided to manufacture paravanes in this country.

The drawings, when examined, showed that the device was very similar to a torpedo, and that three different types were necessary for the equipment of ships of different speeds.

Type M for merchant ships and other ships of speeds up to 16 knots.

Type B for battleships and other vessels of speeds up to 22 knots.

Type C for cruisers and other vessels of speeds up to 28 knots.

The similarity of paravanes to torpedoes, and the urgent necessity for early production, practically limited the manufacturing proposition to a concern experienced in the manufacture of torpedoes. The maintenance of secrecy prevented any published advertising, but two bids on the manufacture of paravanes were secured, and fortunately the bid of the W. E. Bliss Co., Brooklyn, N. Y., the principal torpedo manufacturers in this country, was the lower bid. As the price compared favorably, considering the price of labor and material, with the prices paid by the British Admiralty as cabled to the bureau, the contract for the manufacture of several hundred paravanes of each of the above types was awarded to this concern on September 1, 1917.

Samples of the towing rope, and also the towing sleeve were secured through the courtesy of the International Mercantile Marine, and were placed in the hands of the experts of the John A. Roebling Sons Co. for analysis. The John A. Roebling Sons Co. offered to make up two towing ropes at their own expense for test in actual service. A test of these ropes was conducted informally by the American Line steamer *New York*, this steamer having been fitted with paravanes in Liverpool shortly after striking a mine. This test showed that American wire-rope manufacturers could equal, if not improve, the wire-rope construction of the British manufacturers.

In the meantime such information as had been received from England regarding installations and underwater fittings was forwarded to the different navy yards, and the yards were requested to prepare designs for the installation of underwater fittings on the battleships and cruisers.

In October, 1917, the bureau decided to send an officer abroad to study paravanes, and accordingly Ensign G. L. Catlin, United States Naval Reserve Force, who had already been assigned to duty in connection with paravanes, was sent to England for this purpose. He reported to Admiral Sims, through whom arrangements were made with the British Admiralty to enable him to study the various phases of the British paravane organization. He spent considerable time at the paravane department at Portsmouth Dock Yard and visited several manufacturing plants, where he was able to see paravanes manufactured. He visited a paravane testing station at Portland Harbor, and also spent some time with the Grand Fleet.

This officer returned to the bureau early in January, 1918, submitting a detailed report on paravanes—their construction, testing, and operation.

The British Navy had then an organized paravane department, with a total personnel of over 300, including 70 officers, to cover the design, inspection, and testing of apparatus, together with instructions as to its use. Its records up to that time showed that 2 battleships, 5 cruisers, and 20 merchant ships had cut German mines with their paravanes. In addition to the saving of these ships themselves, the cutting of the mines had led to the discovery of mine fields hitherto unknown. The Admiralty had ordered that all British merchant ships be equipped with paravanes as soon as possible.

In view of the information received, the bureau immediately took steps to form an organization along similar lines. It was decided after a conference to establish a section called "Protective Devices" under the maintenance division of the bureau to organize and direct activities in connection with paravanes.

Briefly these were as follows:

1. Prepare and forward to each navy yard full instructions as to fitting naval vessels with paravanes according to the latest information received.
2. Issue instructions, prepare drawings, and make necessary arrangements for the Emergency Fleet Corporation to fit their vessels with paravanes.
3. Choose and arrange the assignment of a vessel of proper size, power, and speed for testing paravanes.
4. Choose a proper location for a testing station and design the layout and necessary equipment.
5. Organize a testing crew and design the necessary equipment and changes to fit up the testing vessel.
6. Compile and publish a confidential handbook on paravanes for the use of naval officers.
7. Secure and fit out a vessel suitable for a paravane instruction ship and also a mine layer to operate in connection with her.
8. Start an instruction organization and make all the necessary arrangements in regard to operation of the ship, a course of instructions, etc.
9. Organize an inspection force to carry on the inspection of paravanes in the course of manufacture, including the inspection at the works of the principal subcontractors.
10. Organize an inspection force of naval officers to inspect vessels being equipped with paravanes by the Emergency Fleet Corporation.

At this time the German submarines had not laid any mines on our coast, but as United States vessels were continually sailing into mine fields in foreign waters the bureau decided that all of these activities should be started with the least possible delay.

The first step taken was to prepare drawings and full instructions for the installation of paravane gear on naval vessels and send them out to the navy yards. The various naval vessels were listed and the proposed dockings charted so that the installation on each vessel could be anticipated by the bureau and the necessary instructions issued in advance to the navy yard at which the vessel was scheduled to dock.

The system adopted was to have each navy yard prepare drawings of the design of the underwater fittings and general arrangement for each vessel in general accordance with type plans sent out by the bureau. Blue prints of the plans for each vessel were forwarded to the bureau for examination and approval, but the navy yards were authorized to proceed with the work in advance of this approval in order to save delays.

To expedite the work the bureau arranged for the purchase in quantities of certain special fittings common to all naval vessels, allotting a certain number to each yard to be reserved for paravane gear.

A system of charted reports was started, on which the navy yards reported every two weeks the status of the paravane work on each ship. A progress card was started for each vessel and the information from the yards entered as received. This system enabled the bureau to have the latest information on each vessel in shape for quick reference.

A system of records in connection with paravanes and towing ropes was started and the policy established of controlling the assignment of paravanes direct from the bureau. No vessel was allowed to receive paravanes until the bureau was satisfied that installation of fittings was completed.

The Secretary of the Navy, having advised the Emergency Fleet Corporation to equip their vessels with paravanes, directed the bureau to furnish that corporation with information in regard to the organization of the work. Several conferences were held with the corporation's officials, and detail descriptions and all drawings necessary were supplied.

In common with the British practice, the device as used for merchant vessels was termed "Otter gear," and in naval work was referred to by the abbreviation "PV."

As previously stated, all information on the subject of paravanes had been kept confidential, even among naval officers, and as a matter of fact very few naval officers had ever heard the name of the device up to this time. As it was considered necessary that each vessel being fitted with paravanes should have a book containing full information as to theory, construction, maintenance, and operation of paravanes the bureau proceeded to compile and publish a confidential handbook called the PV Handbook for the use of naval officers. This book was completed on March 25, 1918, and a copy was forwarded to the commanding officer of each battleship, cruiser, and transport, the bureau requiring a signed receipt for it. At the same time, another handbook, called the Otter Gear Handbook, was compiled, containing information necessary for merchant ship captains, and copies of this book were furnished to the Emergency Fleet Corporation for distribution to ships.

The formation of the plans for testing paravanes was hastened by the receipt of a cablegram from the British Admiralty in January, requesting the bureau to assign an officer to inspect the service tests of 400 Otters being shipped to this country for the equipment of British ships in American ports. In view of this request the bureau decided to not only inspect but to actually carry on the testing of these British Otters, in order to have a testing organization in full operation in advance of the production of American paravanes.

Although torpedo boats were used by the British Navy for testing vessels, it was believed that some fast yacht might do the work and the U. S. S. *Winchester*, a converted yacht of 30 knots speed was chosen. She was ordered at once to Norfolk navy yard to be fitted with the gear for testing. At the same time a location for a testing station was found at Yorktown, Va., where the necessary deep water, available dock, and desirable secrecy, was combined. A layout for a railroad, derricks, shop, and other equipment on the dock, was prepared, and plans and specifications were furnished to the Bureau of Yards and Docks with a request that the work be rushed.

As it was necessary to have an instruction ship to train merchant ship captains, as well as naval officers, the bureau suggested to the Emergency Fleet Corporation that it furnish a vessel for this duty, the Navy to operate the vessel and direct the course of instruction. The Fleet Corporation accepted this suggestion, and a search was made for a proper vessel, to be, if possible, some vessel not engaged in overseas transportation. The Fleet Corporation finally suggested the steamer *Berkshire*, of the Merchants & Miners Line, and the bureau's representative was asked to inspect her at Providence. After inspection, it was decided that the *Berkshire* should be fitted up for this duty, and the Emergency Fleet Corporation promptly commandeered the ship and started at once to install the gear necessary to make her a Paravane Instruction Ship. Three different devices used for towing paravanes were installed under the advice of the bureau.

The *Berkshire* being ready for operation, a base for her was established at City Island, near Pelham Bay Camp. This location made her within easy reach of New York City, and also gave her a deep water course in which to operate her paravane.

The *Berkshire* was completely fitted by the 1st of May, 1918. A difficult situation arose in regard to the selection of a commanding officer for the *Berkshire* as no American naval officer at that time, outside of the bureau's representative who could not be spared had had sufficient experience to qualify him to instruct in the operation of paravanes. However, one American ship, the *New York*, of the American Line, had been fitted with paravanes in England some 6 months before and it was therefore arranged to call her chief officer, Lieut. H. R. Lewis, R. N. R., into active service, temporarily, for this duty. After about a month, Lieut. C. C. Jones qualified under his instruction and continued in command of the instruction ship throughout the war.

A lecture room was fitted on the *Berkshire* and a moving picture machine installed for the purpose of exhibiting three confidential films showing the manufacture, testing, and operation of paravanes, these films having been secured by the Bureau of Construction and Repair from Vickers Limited through the naval attaché at London.

The daily course of instruction consisted of a lecture on paravanes, exhibition of moving picture films, and then, the class proceeding to the deck, the operation of the different types of towing devices was conducted and explained. Finally the paravanes were launched and the vessel by that time would be approaching the two mines previously laid by the *Bivalve*, a small mine layer, cutting them with her paravanes. The vessel was then swung around heading for her base, the paravanes were picked up, and the opportunity given to any of the class to see the operation of any part of the gear which had not been made entirely clear to him.

In connection with the operation of the *Berkshire*, an office called the Otter Gear Instruction Office, was established in the office of the superintending constructor, New York City. To this office, all officers and men ordered to take the instruction of course were required to report for identification and visé of orders, before they were allowed to go aboard the *Berkshire*. Each man was also required to sign a register on board the *Berkshire*.

As the report of the bureau's representative showed that the greatest care must be taken in the manufacture and inspection of paravanes, an inspection force was organized with headquarters at the office of the superintending constructor, at New York. Several inspectors were assigned to the E. W. Bliss Works, and several were sent to the factory of the principal subcontractor, the Bossert Corporation, Utica, N. Y. A great deal of credit should be given to this inspection force, for it was mainly through their efforts that the production was not delayed by lack of attention to priority orders, and at the same time their careful inspection resulted in the first paravanes of each type manufactured in this country passing service tests on the first run.

The fitting of the Emergency Fleet Corporation vessels with Otter gear was started under the advice of, and carried on under the supervision of, the Navy Department. The bureau, therefore, organized an inspection force to inspect each Otter gear installation on Emergency Fleet Corporation vessels during construction, and, after completion, to be sure that the gear was properly installed and in working order.

The chief inspector was established in the office of the superintending constructor, New York City, and inspectors reporting to him were stationed at Norfolk, Philadelphia, and Cleveland. A detailed report on each inspection was forwarded direct to the bureau.

All of the activities in connection with paravanes were well under way in the spring of 1918. The testing ship *Winchester* ran her first service test on March 1, 1918.

The first shipment of American paravanes was made from the E. W. Bliss Works, on April 13, 1918. Previous to that time the testing ship was engaged in testing British paravanes and arrangements were made to borrow British paravanes. By this arrangement the bureau was able to furnish paravanes to any vessel as soon as her other fittings were completed by a navy yard.

The first naval vessel completely fitted out with paravane gear was the battleship *Texas* on January 30, 1918.

On September 7, 1918, an event occurred which justified at once the entire expense incurred by the Navy Department and Emergency Fleet Corporation in connection with paravanes. The U. S. S. *South Carolina*, proceeding from Yorktown, Va., to New York, cut a German mine with her starboard paravane about 6 miles off the New Jersey coast. The mine came to the surface off the starboard quarter of this vessel and was seen not only by the officers on the

U. S. S. *South Carolina* but by the officers on watch on the U. S. S. *New Hampshire*. The latter vessel, following the *South Carolina* in column, sheered out to avoid the mine on the surface.

The records of the British service, up to November, 1918, are understood to show the following definite reports of 72 cases of mines cut by paravanes: Thirty-seven cut by light cruisers, 3 cut by armed merchant cruisers, 1 cut by a mine sweeper, 1 cut by a cruiser, 1 cut by a battle cruiser, 1 cut by a battleship, and 28 cut by merchant ships.

The above were in addition to reports from 12 naval vessels and 12 merchant ships which were not considered as containing absolutely definite evidence.

After the armistice was signed, as it was believed that the use of paravanes would gradually decrease and probably be discontinued in the course of a year, some of the contracts for production of paravanes were canceled, and others were reduced. The testing of new paravanes was continued, and in December the testing ship *Winchester* was sent to City Island, N. Y., in order to be near the Bliss Co.'s works.

The instruction ship *Berkshire* made her last run in December, 1918, but the lectures and other instruction on board were continued until February 3, 1919.

A statistical summary covering the manufacture and production of paravanes for the United States Government, inspection, test guns, etc., is attached.

STATISTICS.

Manufacturing and production.—The total number of each type of paravanes manufactured by the Bliss Co., excluding cancellations, were as follows: Type M, 1,400; type B, 296; type C, 300; total, 1,996.

The total number of each type purchased from Vickers (Ltd.) was as follows: Type M, 500; type B, 110; total, 610.

In addition to the above, 27 type B paravanes purchased from Vickers were lost on a vessel sunk by torpedoes.

Testing.—The number of test runs made by the testing ship *Winchester* up to April 15, 1919, was 1,506.

Instruction.—The number of runs made by the instruction ship *Berkshire* was 103; number of mines cut, 168; naval personnel instructed, 473; merchant ship officers instructed, 204; British naval officers instructed, 13; miscellaneous, 172; total, 862.

Inspection of emergency fleet vessels.—Number of vessels inspected, 229; date of first inspection, May 11, 1918; date of last inspection, February 28, 1919.

NAVY GAS MASKS.

For some time prior to the United States becoming involved in the war the Bureau of Construction and Repair had been investigating the subject of gas masks for naval use. Very little information could be obtained as to what had been done abroad by either the Navy or War Departments, but samples and reports were obtained early in 1917 which furnished material for study and tests.

As war became imminent, the work of development, which involved not only the type of mask but also the manufacturing facilities to produce it, was pushed to the utmost, with the result that on May 7 contracts were placed for 50,000 masks, this number being subsequently increased to 75,000. As related in detail hereafter, experimental and development work was continued during the succeeding year, with the result that in June, 1918, contracts were placed for 220,000 masks of an improved type. When the armistice arrived, 95,000 of this number had been delivered, and the remainder were canceled.

Before proceeding with the story of our own development of the mask, it is interesting to quote the report of a German observer made immediately after the battle of Jutland and showing the important part played by these masks in a modern naval engagement:

"Only two days before leaving for action a large number of the vessels that by chance were those that took the most active part in the battle; that is, the battle cruisers, and the vessels of the third squadron, received the gas masks with the supplies of potash, more than an abundant supply for the entire crew (on the *Scydlitz* 1,500 masks for 1,200 men). The masks were of the same type as that used by the Army against asphyxiating gas. Every man had a mask either on his head or else hung around his neck. All of the officers

emphasized to me the fact, that according to their experience, the masks were an absolute necessity and that they not only saved an extraordinary number of human lives but made possible work and service in the compartments which otherwise would have to be deserted unconditionally. The gas from the bombs, mines, and torpedoes penetrated the ventilating system, speaking tubes, etc., in places that are very distant from the disaster and to an extent never thought possible. In many cases a great part of the personnel of the turrets struck could escape, thanks to the masks, remaining at their posts long enough to carry away those seriously wounded; in one instance the personnel of the main engine room into which asphyxiating gases had penetrated was able to stay at its post until the room was ventilated."

In developing our own mask for naval use, three types used and developed by the European belligerents were carefully examined and considered. The French type, shaped like the mask of a baseball catcher, was rejected as not reliably gastight, and because it imposed rebreathing exhaled air to some extent. Also, in order to be kept ready for use, it had to be frequently and carefully dipped in rather complicated solutions, and partially dried. The English mask, first adopted by the Army, appeared entirely efficient and reliable, but was considered too clumsy for naval use, involving a large knapsack and a chemical container suspended on the chest, with flexible hose connections to the face mask. The German mask was light, compact, and carried entirely on the head, but lacked the mouthpiece, nose clips, and exhaling features of the English mask, being considered inferior in those respects where active work and an adequate supply of air were required.

A gas mask known as the Mark I, Navy type gas mask, was designed by Lieut. Commander A. H. Marks, C. C., U. S. N. R. F. in cooperation with the Bureau of Mines experiment station, and also with the assistance of the research laboratories of the Goodrich and U. S. Rubber Cos., which undertook contracts, and which found considerable difficulty in developing quickly all the details of construction, the production of the chemical filler, etc.

The Mark I mask was a composite of the German and English types referred to above. In appearance, weight, and convenience, it resembled the German mask, being self-contained on the head, with no connecting tubes or straps, but functionally and chemically it was the English mask, with capacity of from two and one-half to three hours total exposure to effective gas concentrations.

This mask was submitted to the fleet for criticism before being adopted, was pronounced satisfactory, and production proceeded with. The Bureau of Medicine and Surgery instructed classes in gas defense at the Naval Medical School, and tests were conducted by the Bureau of Ordnance at the naval proving grounds in conjunction with the Bureau of Mines. By December, 1917, practically every large ship of the Atlantic Fleet had on board one or two officers specially trained to give instruction in gas defense. In the meantime a demand came from the fleet and from observers abroad for a mask having longer life, for one interfering still less with the freedom of the wearer, and for doing away with the mouthpiece. This resulted in a new design, known as the Mark II, head canister type, which got into production in the summer of 1918 and deliveries of which were being made when the armistice was signed.

On May 31, 1918, the Secretary of the Navy appointed a special board, of which Capt. J. T. Tompkins was senior member, and which included representatives of the Bureaus of Ordnance, Construction and Repair, and Medicine and Surgery, for the purpose of considering and making recommendations regarding the use of gas in naval warfare. The board was directed to submit an estimate of the situation based upon available information from abroad and upon the results of research and experimental work carried out under the supervision of the bureaus of the Navy Department and Bureau of Mines. Recommendations were called for both as to offensive and defensive measures to be employed. Under the head of "Development of gas defense in the United States Navy" the board reported:

"With good masks and good gas discipline the bad effects of the use of gas by the enemy may be greatly reduced. With the new Navy head canister mask and good training there should be a comparatively small decrease in the efficiency of the men.

"A good mask should have the following characteristics:

"(a) Protection of the lungs against all gases with the possible exception of carbon monoxide. Protection should be furnished against high concentrations for about 20 minutes and against low concentrations for two hours.

- “(b) Protection of eyes against all lachrymators.
- “(c) Filtration to remove sneeze gas smoke.
- “(d) Low resistance to the passage of air.
- “(e) Slight interference with the movements of the body.
- “(f) Slight interference with vision. Nondimming eye pieces.
- “(g) Slight interference with talking.
- “(h) Rugged construction.

“The Bureau of Construction and Repair has provided about 75,000 gas masks for the fleet of a type developed at the outbreak of the war. While at the time this was the most highly developed type of gas mask in use by any belligerent, it does not meet all of the essential requirements mentioned above.

“A new type of gas mask has since been developed under the Bureau of Construction and Repair, which meets the above requirements much more satisfactorily than the old type. Bids for 220,000 of these masks will be opened on June 25, 1918, this quantity representing a mask for every person afloat, plus 10 per cent of spares. This mask is of the head canister type. This type was adopted after consultation with the fleet and after sample during various stages of the development of the mask had been submitted by a representative of the Bureau of Construction and Repair to the commander in chief for criticism and approval.”

Included in the recommendations of the board were the following “defensive measures”:

“To provide gas masks, with necessary spares for all the personnel of vessels of the battleship, cruiser, and destroyer forces, the masks to be so designed as to afford protection to personnel against noxious gases for as long a period as possible without change of mask or chemicals, and so designed as to interfere as little as possible with the freedom of movement required for the proper performance of duty. Stowage for gas masks to be so arranged as to make them readily available to personnel at their battle stations.”

“The establishment of a complete system of training of ships personnel in gas defensive measures and gas discipline.”

“To continue experimental work in the development of new gases and methods of protection against gases used by the enemy.”

“That, in view of the fact that the Bureau of Construction and Repair and Ordnance and Medicine and Surgery are all charged with certain duties relating to gas warfare, and in view of the vital importance of this subject, an officer of rank in the Office of Operations be detailed in charge of this work, who will, under the Chief of Naval Operations, coordinate the work of the various bureaus concerned.”

“It is considered most important that crews be thoroughly trained in defense against gas. Army reports state that in gas warfare on shore, by far the greater number of casualties have been proved to be due to inefficient training and slackness of discipline. When masks are worn, the fighting efficiency of men will be considerably reduced, and in order to reduce this loss of efficiency to a minimum, they must be trained to wear masks for a considerable period and to carry out all their duties while so protected.”

“Training in gas defense to be divided into three categories, viz:

- “(a) Training instructors and specialists.
- “(b) Training ships' officers and petty officers.
- “(c) Training ships' crews.”

The report of the board was approved by the Secretary on July 1, 1918, and Capt. Tompkins was detailed “to coordinate the work of the various bureaus concerned in preparing the naval service to successfully counter the use of gas as an offensive weapon in naval warfare.”

The Mark II mask, with its standard canister containing absorbents calculated to give protection for about six hours against concentrations of lethal gases such as ordinarily met with in land warfare, consists briefly of a closely fitting mask and rubberized cloth helmet. To this cloth helmet a light aluminum headpiece is attached by means of elastic straps. The aluminum headpiece forms a saddle, to which the canister containing the chemical absorbents is strapped. A Y-shaped coupling is used for connecting the end of the canister with rubber tubes, through which the air passes to the face piece. The filter pads consist of special felt layers separated by corrugated wire screen and are secured to each side of the headpiece. A cross tube of rubber connects the nozzle and filter pads to the intake end of the canister, so that air passing to the wearer's lungs must first pass through the filters, where the smoke is removed, thence through the chemical in the canister, where the poisonous

elements of the gases are absorbed. The exhaled breath of the wearer is relieved through a rubber flutter valve which projects vertically above the eye-pieces. In order to prevent the exhaled breath from passing through the canister, which would be injurious to the chemicals, small check valves are fitted at the lower ends of the rubber tubes. As a still further protection, a disk check valve is fitted in the nozzle of the canister at the intake end. The incoming air is directed from the lower ends of the tubes so as to pass across the inside of the lenses in order to prevent dimming.

In the case of the true war gases the poisonous elements are absorbed by certain chemicals contained in the canister of the outfit, the water drawing the outside air through this canister before it reaches his lungs. In the case of smoke gases the particles are actually strapped to the sides of the canister. The chemicals in the canister and the smoke pads afford protection against all known forms of war gases. The standard war equipment consists of the gray canister and the side filter pads. For protection against carbon monoxide, which is not considered a war gas, the gray canister of the regular outfit is removed and replaced by a canister containing special chemicals for absorbing carbon monoxide. The carbon monoxide canister is painted black, to be used only in cases of fire fighting or where carbon monoxide alone is suspected or known to be present.

BUREAU ORGANIZATION.

To accomplish the work which has been briefly described, there was enormous expansion of the Bureau of Construction and Repair. The total force—officers, clerks, and technical employees—numbered 143 on July 1, 1916; 233 on July 1, 1917, three months after we entered the war; and 556 on July 1, 1918. A maximum of 687 was reached on November 15, 1918. This great expansion, which was made without any serious changes in organization, the organization which had been developed in peace being found sound under the strain of war conditions. The expansion did require some subdivision of existing divisions into manageable sections. For instance, under peace conditions, Design and Production were handled by the same subdivision of the bureau. It was found desirable to separate production and make a new division of it during a part of the war. Production was one of the largest divisions of the bureau. With the expansion of force the administration of the bureau, which had been carried on in peace without a titular organization for it, was placed in a distinct division. After the above changes the eight divisions of the bureau were made one.

Design, Production, Maintenance, Administration, Contracts, Shore Establishments, Supply, Aircraft.

The duties of these divisions, which continue in force, may be briefly outlined as follows:

Design Division.—This division has charge of all design work, including large alterations of completed vessels, research on subjects useful for design work, changes on ships under construction, and the model basin. The design division also follows up the construction from a design point of view.

Production Division.—The functions of this division consists principally in analyzing and anticipating the requirements for materials under the cognizance of the bureau; uncovering new sources of supply when the normal sources are inadequate to meet the demands; following up production by means of charts and reports from the field, and assisting contractors in becoming familiar with Government methods. During the war, this division was also responsible for presenting to the various committees and divisions of the War Industries Board, the necessary data for obtaining priority on materials used by, or for the bureau, the allocation of steel or other materials when the supply of such materials was limited, etc.

Maintenance Division.—The division handles all questions having to do with completed ships.

Administration Division.—This division is a general-service division and has to do with administration in bureau affairs, as distinct from the operations. It deals mainly with bureau personnel and organization. The personnel of other divisions is under the administration division for administrative purposes.

Contracts Division.—This division has charge of questions which arise in connection with the preparation of contracts for new vessels and important contracts generally in which the bureau is involved, and questions, other than technical, arising during their execution. It also handles for the bureau all

matters arising in connection with the work of the Compensation Board (except those involving the approval of prices and orders), and the general financial questions involved in contracts and payments. During the war and the year following, this division also handled a great number of incidental matters arising in connection with payments, penalties, delays, and changes in contracts; plant rentals, supplementary agreements, etc.; becoming, in effect the bureau's liaison with the Compensation Board and with the office of the Solicitor for the Navy Department.

Shore Establishment Division.—This division deals with questions of plant and organization, mechanical equipment, personnel, costs, and manufacturing processes at shore stations.

Supply Division.—This division deals with requisitions, contracts, and specifications for, and inspection of materials.

Aircraft Division.—This division deals with all matters under the bureau connected with aircraft, including seaplanes, airships, captive balloons, etc.

The volume of work done by the bureau is perhaps best measured by the expenditures for which the chief of the bureau is held responsible, whether by law or by Executive order. The following approximate figures indicate the enormous increase which must fall on each and every part of the administrative organization of the Navy Department in time of war:

	Average annual expenditure by Bureau of Construction and Repair.	
	1912-1916	1918-19
From appropriation "Construction and Repair".....	\$9,000,000	\$71,000,000
From appropriation "Increase of the Navy".....	9,000,000	222,000,000
From miscellaneous appropriations.....		31,000,000
Total.....	18,000,000	327,000,000

From these figures it can be seen that the expenditures increased eighteen-fold during the war years in comparison with the average of four prewar years, while the number of officers and employees in the bureau increased less than five times. These figures show better than words could tell the always faithful and efficient and at times brilliant services rendered by the entire staff of the bureau, without which the results herein briefly recounted would not have been attained.

Secretary DANIELS. It may not be known, even to the members of this committee, that before the armistice the United States Navy was operating 834 vessels and had a force of 175,000 officers and men engaged either in European waters or in trans-Atlantic war service plying the war zone.

The "Summary of Activities of United States Naval Forces Operating in European Waters," compiled and issued from Admiral Sims's headquarters in London, gives a total of 373 vessels actually present on November 11, 1918, with 27 other ships assigned to that service, and states that "at the cessation of hostilities there were approximately 81,000 officers and men serving in Europe." This includes more vessels and a larger personnel than was in the entire Regular Navy at the beginning of the war, when there were 362 vessels on the Navy list, of which 20 were old craft listed as "unserviceable for war purposes," and 67,043 officers and men.

But the Sims figures include only vessels and men directly attached to the European force. They do not take into account the cruiser and transport force, which before the armistice comprised 24 cruisers and 59 troopships, manned by 3,000 officers and 42,000 men, that were

constantly plying between America and Europe transporting troops, and which eventually numbered 142 vessels, transporting to Europe 911,047 men and bringing back 1,700,000, handling a total troop movement of over two and a half million men.

Nor do these tables mention the vast fleet of the naval overseas transport force, which before the end of hostilities manned and operated 378 vessels of 2,900,000 dead-weight tons, requiring a force of 4,672 officers and 29,179 men, and which carried to Europe 6,000,000 tons of supplies, munitions, fuel, and materials.

Both these fleets were as truly engaged in European war service as were the forces under his direction, and all sailed the "war zone" to and from European ports, being as truly engaged in serving the allied cause and contributing as directly to the result as did the destroyers and other craft under his command.

If we add to these the 373 vessels directly in the European force, as should be done to denote America's contribution in ships to the allied effort, it will be seen that we had engaged in European war service before the end of hostilities 834 vessels manned and operated by the Navy and 158,851 officers and men. If we add to these the 15,000 to 20,000 men of our armed guard on merchant vessels, all of whom served in the war zone and were engaged in antisubmarine work as truly as were the men on our destroyers, the total number engaged was approximately 175,000.

Admiral Sims in the summary issued by his headquarters states that the number of officers and men serving in Europe represented about 15 per cent of the total naval personnel. As a matter of fact, the total number engaged in war service to and from Europe, as well as in Europe, represents about one-third of the total personnel. When it is recalled that nearly all the 200,000 men who were enlisted in the Navy in the eight months previous to the armistice were trained or being trained to man the hundreds of destroyers and other antisubmarine craft being built and the large number of vessels under construction by the Shipping Board, practically all of which were destined for European or trans-Atlantic service and were to be manned by the Navy, it will be realized that more than half of the entire personnel were being prepared for service in Europe or on transports and cargo ships which were to carry troops and supplies to Europe through the danger zone. We had increased our flying corps to nearly 50,000, of which over 18,000 were serving in Europe, and thousands more men and hundreds of additional machines would have been sent over in the next few months.

If the war had lasted a year longer—as practically all eminent authorities thought it would—and I would like to add, when Sir Eric Geddes and Admiral Duff were in Washington early in October, 1918, they told us that the sinkings by the submarines would be greater in the next six months than they had ever been; and no military man with whom I ever talked or from whom I received any communication, ever suggested that the war would be over before August, 1919. If the war had lasted a year longer, as practically all eminent authorities thought it would, three-fourths of our entire naval personnel, a force of 375,000 or 400,000 would have been engaged in European service or in operating vessels carrying troops or supplies to our Army or the Allies.

I ask that there be placed in the record the following tables, from the "Summary of activities of United States naval forces operating in European waters," which summary was compiled by and issued from Admiral Sims's headquarters in London:

American naval vessels actually present in European waters upon the cessation of hostilities, grouped by bases.

	Total.
Queenstown—2 tenders, 24 destroyers, 30 chasers, 8 tugs-----	59
Berehaven—3 battleships, 1 tender, 7 submarines, 1 tug, 1 oiler-----	13
Brest—1 gunboat, 16 yachts, 3 tenders, 38 destroyers, 9 tugs, 1 station ship, 4 steam barges, 4 barges, 9 mine sweepers-----	85
Cardiff—1 tender, 1 refrigerator hulk, 55 colliers-----	57
Gibraltar—2 cruisers, 4 gunboats, 5 coast guard cutters, 9 yachts, 1 tender, 6 destroyers, 18 chasers-----	45
Genoa—2 tugs-----	2
Azores—2 yachts, 1 tender, 1 oiler, 2 mine sweepers, 5 submarines, 1 tug-----	12
Grand Fleet—5 battleships-----	5
Murmansk—1 cruiser (also Russian destroyers)-----	11
Mine Force—1 tender, 10 mine layers, 2 mine sweepers-----	13
Southampton—4 transports-----	4
Plymouth—1 tender, 2 destroyers, 36 chasers-----	39
Corfu—1 tender, 36 chasers-----	37
Liverpool—1 oiler-----	1
Grand total naval vessels in European waters-----	373

Miles steamed by United States naval vessels in war zone.

These figures of average miles steamed per month by United States forces in European waters are very approximate and all a minimum:

	Miles.
Destroyers-----	270,000
Miscellaneous patrol craft-----	120,000
Mine sweepers-----	10,000
Mine layers-----	10,000
Battleships and submarines-----	90,000
Submarine chasers-----	121,000
Total-----	628,000

III. PERSONNEL.

The following table shows the naval personnel, actually in European war at the beginning of each quarter, since April 26, 1917, and the quarterly increases:

Date.	Total officers serving.	Total men serving.
Apr. 6, 1917.....	5
July 1, 1917.....	214	1,840
Oct. 1, 1917.....	629	8,544
Jan. 1, 1918.....	1,482	22,724
Apr. 1, 1918.....	2,072	31,080
July 1, 1918.....	3,135	47,686
Oct. 1, 1918.....	4,969	75,742

At the cessation of hostilities there were approximately 81,000 officers and men serving in Europe. This represents about 15 per cent of the total naval personnel, which is 31,186 officers and 506,996 men.

BRINGING BACK THE SOLDIERS.

When the armistice was signed the pressing duty of America was to bring back the soldiers who were as eager to come home as their kin and friends were to welcome them. It was a giant task to which the War and Navy Departments immediately addressed themselves with zeal and the employment of every craft that could be secured. In taking the troops across we had been able to secure ships of other nations, principally those of Great Britain, which under contract with the War Department carried something like a million American soldiers to France. These British ships were not available to us as transports until the latter part of 1917 and not in force until after the fateful March drive of 1918. Naturally few were available for bringing back troops to the United States, for they were needed to take home the Canadian and other British forces who were anxious to return home. It was, therefore, necessary for all American ships to be pressed into service, as well as to lease certain German ships manned by American Navy men. But these were not sufficient, and I ordered older battleships and cruisers to become transports until such time as all the American soldiers, keen to come home, had been furnished transportation. It is true that the commander in chief protested against such use of our ships, but I told him the Navy had but one mission, which was to serve America, and that, having served it in the war, we would be adding to the naval contribution by giving voyage home to our returning soldiers.

It had been feared that battleships and cruisers would not afford comfortable quarters for the troops, but the Navy Department received letters and resolutions of thanks, expressing from officers and men of the Army their happiness in having been permitted to make the return trip home as guests of the Navy. They had served gloriously in the Army, and were happy to have a taste of Navy life and Navy accommodations before returning to civilian pursuits. And the Navy was happy in the privilege of playing host across the ocean to many of the soldiers whose valor had turned the tide and won the victory. The country will not soon forget—the soldiers will remember always—this service not required or expected of the Navy, but one which was as acceptable as it was unique in naval usefulness.

Mr. Chairman, I referred a few days ago to the great work done by the Navy when the German interned ships were turned over to the Navy, and which the German officers thought they had destroyed, or so nearly destroyed as to make it impossible for them to be gotten in commission so as to render any service during the war. That was a great contribution of the Bureau of Steam Engineering, and the officers and men who conceived and carried out that work hastened the winning of the war by enabling us to carry soldiers over rapidly, and before our allies allocated ships to us for that purpose.

WORK OF THE BUREAU OF STEAM ENGINEERING.

The outstanding features of the work of preparation of the Bureau of Steam Engineering were:

Within two weeks after war was declared in August, 1914, the bureau requested authority of the Secretary of the Navy to send abroad an officer expert in radiotelegraphy to acquire the fullest in-

formation possible regarding the methods of wireless communication used by the nations engaged in war. This recommendation was approved and Lieut. Hooper sailed the latter part of August, 1914, and remained abroad until January, 1915, during which time he acquired information of great value to the Navy Department.

Following the outline of preparedness submitted by the General Board March 13, 1915—before we entered the war, approved by the department May 28, 1915, nearly two years before we entered the war—investigations were promptly made of the engineering resources of the country in regard to building and repairing machinery and the supply of it necessary for active operation in time of war. These investigations were continued during 1915 and 1916 and up to the time of the declaration of war in 1917, and quarterly reports rendered to the Chief of Naval Operations.

Full advantage was taken of the experience acquired with the electric drive in the collier *Jupiter* to equip also the battleships *California* and *Tennessee*, authorized by the act of March 3, 1913, with the same kind of propelling machinery, and to take similar action in the case of the battleships and battle cruisers authorized by the act of August 29, 1916.

When war was declared extensive preparations were made toward the rapid construction of the destroyers authorized by the acts of August 29, 1916, March 3, 1917, and October 6, 1917, the latter requiring the creation of entirely new facilities for the construction of the 150 destroyers authorized. This large building program necessitated the building of new forging plants, extension of existing ones, and the building of new shops for the construction of turbines, boilers, pumps, and much other of the machinery equipment.

One of the most important activities carried out under the direction of this bureau was the repair of the German ships, whose machinery had been rendered unserviceable prior to February 1, 1917. The necessity for having these ships available for service in transporting troops to France was of such paramount importance as to justify the adoption of unusual methods to make the machinery serviceable. Accordingly, resort was had to the use of electric welding on a scale which hitherto had not been dreamed of and with such success as to win the admiration of the mechanical world. Without these ships it would have been impossible for us to have transported our Army to France, which fact makes this accomplishment preeminent in war work.

In regard to submarines whose machinery had been criticised by Admiral Grant, contracts were let in 1915 and 1916 for the renewal of the engines of two of the E's and three of the F's; in May, 1917, for the renewal of the engines of eight of the K's; in October, 1917, for the renewal of five of the C's and three of the D's, and in January, 1918, for that of three of the H's, which would complete the renewal of all engines of the two-cycle type. And I call your attention to the fact that most of these submarines—I think all of them—were built long before I became Secretary of the Navy.

In February, 1917, designs were prepared for a submarine chaser and contract for the machinery of 150 let March 20, 1917, which contract was later extended to the construction of machinery for 462 vessels of this type.

When we first decided to construct the submarine chasers they were the largest ships that could be built in America, and we had already contracted with every shipyard and every shipbuilder in America for every type of ship that they could build, and we built these submarine chasers in yards that could not be used for building destroyers or other craft. We thought that they could be coast defense ships, and we built them mainly for that; but they proved to be so much better than we dreamed that the French and the Italians urged us to let them have some of them, which we did, and their service in the war was one of the conspicuous new and outstanding features. We constructed a new type of ship, and these submarine chasers rendered great service not only in France but in the Adriatic, and one squadron of them sunk two submarines. It is true that they did not get credit for it by the British Admiralty, but I shall take steps in that matter.

The CHAIRMAN. That was in Italy?

Secretary DANIELS. In the Adriatic. I shall take steps to see that American naval officers review every action of an American ship with a submarine and that the final court that passes upon them will be an American court and not the British Admiralty.

Submarine detection, which was destined to play an important part during the war, was taken up in February, 1917; and I beg to call attention to the fact that this was before the war—at the time of the break in relations with Germany—before Congress had indicated to the executive departments that it was going to declare war. Submarine detection, which was destined to play an important part during the war, was taken up in February, 1917, and investigations of a particular system undertaken by a group of scientists from leading universities of the country. This was followed by other investigations in March, and later by cooperation between three of the principal companies who had been prominently identified with similar work and whose operations were carried out at Nahant, Mass., and New London, Conn., under the direction of a special board. The instruments developed at these places proved highly effective in operations against submarines.

The construction of 150 Eagles, contract for which was awarded the Ford Motor Car Co., was initiated in December, 1917, and required the creation of new facilities for accomplishing. It required also that the machinery should be of a special type suited for vessels engaged solely in submarine detection, which requirement was successfully met.

Under the terms of the act of March 4, 1917, which authorized the construction of mine sweepers, the services of firms not engaged in the construction of battleships, destroyers, and submarines were enlisted and orders placed for 36 from June to September, 1917, and later extended to 54 of these vessels. Similar action was taken in the construction of seagoing tugs and harbor tugs, the facilities of navy yards and Lake establishments being utilized for the building of the former and of wooden shipbuilders for the latter.

The important part played by wireless telegraphy in keeping up communication with the fleet and with our forces abroad made necessary the erection of a high-power station at Annapolis and another at El Cayey, P. R., and later of a still larger station for the French

Government at Bordeaux, the design of which was prepared and the material purchased and supplied by the Navy Department. Later developments in Siberia required the equipment of a station at Vladivostok in order to keep in touch with our troops in that region. This equipment had to be very hurriedly assembled from stations in the Pacific, transported, and installed in an abandoned Russian station on Russian Island, near Vladivostok.

In cooperation with the War Department and the Bureau of Mines of the Interior Department, there was successfully completed at Fort Worth, Tex., two experimental plants for the production of helium, which was considered of great importance for use in dirigibles and observation balloons instead of hydrogen. At the time of the armistice sufficient helium had been produced to enable a quantity to be prepared for shipment abroad, and the experimental equipment was so successful that plans were developed for the construction of a plant for the production of this gas in quantity.

Important work was done in the equipment of air stations at home and abroad, in development of the geared Liberty engine, and the supply of engines for aircraft and training planes generally.

The task of maintaining in efficient condition the machinery of such an enormous fleet was one of great magnitude. The facilities of navy yards were extended to the limit and use made of every private establishment that was equipped to handle repair work. New repair ships were equipped and sent abroad, where they rendered excellent service in maintaining the machinery of patrol and convoy vessels. The work done by the two repair ships stationed at Queenstown was of such high order as to elicit the highest praise from Admiral Sir Lewis Bayly, R. N., who was in command of operations from that base. This officer stated that without these repair ships the work could never have been done. Besides the repair ships, five major bases were established abroad and several minor ones.

I submit this in regard to the work of the Bureau of Steam Engineering, Mr. Chairman.

(The matter last referred to is here printed in full in the record, as follows:)

PREPARATIONS MADE BY THE BUREAU OF STEAM ENGINEERING TO SECURE A STATE OF PREPAREDNESS AND GENERAL OPERATIONS OF THE BUREAU.

In beginning it is considered advisable to state briefly the general character of the work that comes under the cognizance of the Bureau of Steam Engineering in order that a comprehensive idea may be formed of the magnitude of its work during the war and the responsibility thus attached to it.

Its field is chiefly dynamical engineering. It supplies boilers and engines to all classes of ships, and also the numerous auxiliaries and accessories necessary for their operation and for their maintenance in efficient condition, as well as for much of the equipment installed to add to the comfort and the health of the crew.

It provides means for an abundant supply of fresh water for the crew, which in a battleship numbers nearly 1,500 men, and also facilities for making ice and for keeping refrigerating rooms properly cooled. It also provides a supply of salt water for sanitary purposes.

It provides electric current for interior illumination and for operation of searchlights and power for the operation of a multitude of auxiliary appliances necessary for the operation of the ship or the comfort of the crew. These functions range from that necessary to operate a cigar lighter to that required for operation of the high-power motors used in our latest ships fitted with electric-drive machinery. Telephones are supplied to meet the requirements of the

interior communication system and the fire-control system and call bells and accessories for various purposes.

It provides steam and electric power for heating and for cooling and portable electric fans for ventilating spaces which may not be adequately served by the main ventilating system of the ship.

In the radio field it supplies all radio equipment for high and low power shore stations and for ships of all classes, including aircraft.

It supplies the machinery, whether steam or gasoline, for the ships' motor boats.

For submarines it provides the oil engines for operation on the surface and the storage batteries and the motors necessary for operation when submerged.

For aircraft it provides the propelling engines and accessories, the wireless equipment, and a supply of gas for balloons and dirigibles.

For navy yards it provides the equipment of machine and hand tools necessary for the operation of the shops of the machinery division, and makes similar provision for the equipment of the repair shops of individual ships and of repair ships which accompany the fleet.

It prepares specifications covering the requirements for all the material and equipment that it uses, operates an inspection force for inspecting this material and equipment at the place of manufacture, and fixes the allowance of supplies for the engineering department of ships in commission.

An experiment station is under its direction for the test of apparatus and for the investigation of engineering problems pertaining to the Navy.

The first work done by the Bureau of Steam Engineering after the outbreak of the war, in August, 1914, to keep in touch with the general situation and to make such preparations as might be necessary to insure the readiness of the material under its cognizance to meet any emergency was to request the department to send abroad an officer qualified to investigate the radio situation. This action was taken August 17, 1914, as shown by the following letter:

NAVY DEPARTMENT,
BUREAU OF STEAM ENGINEERING,
Washington, August 17, 1920.

From: Bureau of Steam Engineering.

To: Department (Material and Personnel).

Subject: Assignment of specially qualified officer as observer of radio operations in European war.

1. The bureau invites the department's attention to the opportunity that is presented in connection with the proposed employment of Army transports in European waters of obtaining information of great value to the naval service. A trained observer, having authority to transfer from one of these ships to another or to United States naval ships in the war zone, could, by simply listening in to the radio communication carried on, acquire information not only as to foreign material equipment but also as to principles of organization and tactical operation in regard to which our service has never received any information and which probably never can be acquired by any other method. It is essential, however, that the officer selected for this duty be one whose qualifications embrace not only expert operating ability but also special training in radio organization as applied to the intricate requirements of tactical use. It happens conveniently that Lieut. S. C. Hooper has just been relieved as fleet radio officer, Atlantic Fleet, and should now be available for this duty. This officer has been engaged during the last two years in establishing an efficient radio organization in the fleet, and he is preeminently qualified for the duty suggested. In fact, his special training for this particular work could not have been improved upon by design. The bureau recommends that the necessary arrangements be made with the War Department and that orders be issued to Lieut. Hooper giving him the largest allowable discretion in obtaining the data desired.

GRIFFIN.

Orders were issued in accordance with the above recommendation and Lieut. Hooper sailed on the *Olympic* the latter part of August, 1914, and remained abroad until January, 1915, returning on the *St. Paul*. The time was spent in England, France, Ireland, Belgium, and Holland. At the time of Lieut. Hooper's visit to Belgium it was occupied by the Germans, but he was nevertheless able to obtain information of value.

It was difficult to obtain information regarding radio matters from the Allies on account of the strict censorship that prevailed but Lieut. Hooper's practical knowledge enabled him to listen in at various places and thus to acquire complete information regarding the system in use by the Allies and the use to which radio was put. This information was later found to be correct when we entered the war. He also inspected the apparatus under manufacture for the British Government and visited the principal high-power station at Carnarvon, Wales, which, at that time, was the largest station in existence. The information of most value that he obtained was in regard to the distant control of radio stations, which was later adopted for our Navy.

As a result of the complete information acquired a board was appointed with a view to improving the communication service of our Navy. The general plan outlined by this board was the foundation of the present organization of the naval communication service and has remained practically unchanged.

March 13, 1915, the General Board submitted to the department an outline of a plan of preparedness. This was approved by the department May 28, 1915, and the bureau directed to make the first report in compliance with this outlined plan in one month following the date of its approval, and subsequent reports quarterly. This was followed by a letter from Operations, June 10, 1915, directing the inspection of merchant ships to determine their suitability for use by the Navy, and the bureau directed to make recommendations regarding the alterations and additions that would be necessary in order to make them suitable for Navy service.

The first report of the bureau, dated June 28, 1915, stated that nearly all merchant ships except those for repair and supply ships could be put in service without delay, or without great expenditure; that plans were under way for the conversion of two merchant ships to repair ships; that conferences had been had with Supplies and Accounts respecting supply ships and refrigerating ships; that all auxiliaries could be immediately supplied with searchlights and blinker sets, and with auxiliary radio sets. General comment was made on other features of the order affecting the supply of engineering material. It was stated that the Bureau of Navigation had been furnished with a list of retired officers required for duty under the bureau; that the bureau would be ready to make specific recommendations regarding merchant ships as soon as reports of the Board of Inspection and Survey were received. This was followed October 8, 1915, by a report that plans had been prepared for the conversion of two repair ships and attention was invited to the fact that no reports of inspection of merchant ships had yet been received.

October 28, 1915.—A letter was addressed to the commander in chief, Atlantic Fleet, requesting that supply officers of two ships of the fleet be directed to fill in opposite certain items of the allowance list, the quantity of such material that had been used during six months or a year—this to enable the bureau to prepare a stock list.

November 9, 1915.—The commandants of all navy yards and stations were directed to submit a detailed plan for the expansion on short notice of the facilities of the machinery divisions of the several yards and stations, and to submit an estimate of the time and cost for accomplishing this. A similar letter was sent to the naval station, Guantanamo, on January 8, 1916.

November 12, 1915.—The commanders in chief of the Atlantic, Pacific, and Asiatic Fleets, torpedo flotilla commander, and the commander of the cruiser squadron, Atlantic Fleet, were directed to report the engineering material they considered it desirable to keep on hand in order to secure a state of preparedness for war. Suggestions were requested as to the engineering material which it was desired to carry on fighting ships, repair ships, and tenders under war conditions, and what similar material should be kept in store for emergency shipment to the fleets.

November 13, 1915.—Letters were addressed to all inspectors of engineering material directing them to report the extent to which the capacity of manufacturing plants in their several districts which were engaged in the manufacture of important engineering material could be increased in case of emergency to meet a sudden demand. A list of the important material was given, and in a letter of December 1, 1915, the inspectors were directed to include machine tools in the list. Similar letters were addressed under date of January 25, 1916, to the inspectors of machinery at the Busch-Sulzer Co., St. Louis, Mo., and at the Babcock & Wilcox Co., Bayonne, N. J., to report on manufacturing plants in the vicinity of their headquarters.

November 22, 1915.—A similar letter was addressed to inspectors of engineering material for a report on articles of electric equipment.

November 23, 1915.—Letters were addressed to the two principal manufacturers of submarine storage batteries and to the one manufacturer of submarine signaling apparatus asking that they submit a list of the articles or component parts thereof which they usually carried in stock, and to keep the bureau advised of changes as they occur. A similar letter, dated January 5, 1916, was addressed to the manufacturers of searchlights.

November 30, 1915.—Letters were addressed to the inspectors of machinery at all principal shipyards to report on the machinery repair and building work that could be undertaken in an emergency at the works to which they were assigned, and also of other ships and engine plants in the vicinity that could be relied upon to assist in the preparation for service of the auxiliary fleet.

December 3, 1915.—Letters were addressed to the commandants of all navy yards and stations directing them to submit lists of material which they considered it desirable to carry in stock.

December 7, 1915.—A letter was addressed to the industrial manager, navy yard, Portsmouth, directing him to submit a report on the maximum quantity of articles that could be manufactured with present facilities by an increase in the number of employees, and similar information regarding the output after 30 days by an increase in the facilities as well as in the number of employees. (The Portsmouth Navy Yard specializes in the manufacture of electrical fittings.)

The second report was dated December 31, 1915, and contained specific recommendations regarding improvements necessary in the machinery divisions of navy yards in order to increase their capacity for work. Difficulty in obtaining machine tools was pointed out. Report was made of the facilities of a number of shipyard and repair plants. Special attention was called to the desirability of increasing the stock of engineering material at navy yards and much information given regarding sources of supply and available material of an engineering character. A list was given of the auxiliaries to be taken over or chartered and recommendation made in each case as to the changes that would be required.

Special attention was directed to the inadequacy of the war detail of officers and technical employees under the bureau and to the duplication of work by the Navy Department and the War Department and by different bureaus of the Navy Department in collecting information to carry out the department's order. Special recommendation was made for obtaining funds to prepare navy yards so that they might quickly increase their facilities.

This report, which might be considered the first report under the operation of the plan outlined by the General Board, covered detailed reports on 10 navy yards and stations, on 22 shipbuilding and repair establishments, and on 300 manufacturing establishments which might be called upon to supply engineering material. The report was of such a comprehensive character as to evoke a condemnatory letter from the Chief of Naval Operations.

January 4, 1916.—Inspectors of machinery were directed to report the changes they considered necessary in their office force and office space in order to meet war conditions. The detail of officers assigned for each office under the mobilization plan was forwarded and suggestions requested regarding any modifications that might be considered necessary. A similar letter was sent to the inspector of engineering material on January 5, 1916.

January 15, 1916.—The bureau reported to the department on the difficulty in obtaining engineering supplies and the delay occasioned thereby, cited numerous cases, and recommended that congressional action be secured in order to assure procurement of such material.

January 28, 1916.—A letter was addressed to the commandants of all navy yards and stations expressing appreciation of the work that had been done in connection with the bureau's report of December 31, 1915, and quoted the commendatory letter received from Operations. The opinion of the commandants was requested regarding personnel, and a statement called for as to whether the detail fixed in the mobilization scheme was considered satisfactory. Similar letters were addressed to the inspectors of engineering material and inspectors of machinery.

January 31, 1916.—The commandant of the navy yard, New York, was directed to report on the engineering work that could be undertaken by ship and engine building and repair plants in the vicinity of New York and Jersey City in connection with the alteration, repair, and outfit of vessels that might have

been taken over for auxiliary service. A similar letter was addressed to the Inspector at the Babcock & Wilcox Co., under date of January 25, 1916; to the Maryland Steel Co., January 29, 1916; to 21 other ship and engine establishments, on February 4, 1916; to 10 others on February 8, 1916; and to three others on March 7, 1916.

February 5, 1916.—The Inspectors of engineering materials were directed to ascertain the usual output and also the emergency capacity of manufacturing establishments in their districts for the manufacture of 20 different articles of equipment, which were enumerated by the bureau.

The third report was dated March 31, 1916, and followed the general line of the preceding one. It gave an estimate of the cost to equip the machinery division of navy yards for building battleships, and noted the addition of certain large tools at Mare Island costing \$133,000. It gave details of the building and repair facilities of 45 private yards and the principal details of 66 merchant ships then under construction, besides information from 8 manufacturing establishments for the supply of engineering material; a summary was given of the recommendations made in the case of 38 ships which had been inspected by the Board of Inspection and Survey.

Special attention was invited to the difficulty in obtaining material, and the bureau's recommendation previously made that authority be obtained from Congress to place an embargo on the export of certain material was quoted. Note was made of the increased cost of material.

A suggestion was made for the employment of store ships as distinguished from supply ships, and a list given of engineering supplies which should be carried by supply ships. A list was also given of the personnel of the offices of inspectors of machinery and inspectors of engineering material recommended as "war personnel."

Under date of April 19, 1916, a memorandum was addressed to the Assistant Secretary of the Navy giving the organization of the material branch of the radio service, which is under the direction of the Bureau of Steam Engineering, in which it was stated that there existed in the bureau a list of the material which various manufacturers were capable of furnishing promptly in the event of war, and also what they could do in a specified time. The department was also advised that the active cooperation of the Marconi Co. had been secured for installation of radio apparatus, etc.

The fourth report was dated June 30, 1916, and contained estimates for equipping submarine bases. Information similar to that contained in preceding reports was given on 2 shipbuilding and repair establishments and 14 manufacturing establishments. A list was given of 43 merchant ships for which new equipment necessary to be installed was given. This report also contained a summary of what had been done during the year and noted that detailed plans had been submitted to the department for the expansion of the facilities of navy yards; that reports had been made on 71 shipbuilding and repair plants; and that the inspection reports of merchant ships numbered 112. Difficulty in securing material was emphasized and the organization of the inspection service submitted.

The fifth report was dated September 30, 1916, and contained details of two shipbuilding and repair plants and of six engineering supply establishments. It recommended that a reserve stock of important engineering material be kept on hand, and that estimates be submitted to Congress for the purchase of it. A list of material required to equip merchant ships was given, amounting to \$495,000. It was noted that the department approved the bureau's recommendation regarding the civilian personnel in inspection offices.

The sixth report was dated December 31, 1916, and contained further details of shipbuilding and repair plants of 15 additional establishments for the supply of engineering material. It gave a list of engineering material that should be provided, amounting to \$2,262,500.

The seventh report, dated March 31, 1917, noted the allotment of \$287,000, under this bureau, from the appropriation of \$18,000,000, for the improvement of navy yards, and stated that additional allotments of \$2,744,000 were required. It gave a summary of material required to meet war requirements to cost \$19,115,000. Recommendations were made for the conversion of 28 merchant ships, and 35 patrol boats.

The eighth report, dated June 30, 1917, noted the approval of requisitions for machine tools for navy yards, and recommended the elimination of advertising for such articles during the war; made special recommendations for

obtaining suitable inspectors and urgently recommended that the bureau be permitted to enroll such men in the Naval Reserve.

The ninth report, dated September 30, 1917, gave a statement of certain additions that had been made to navy-yard equipments. Special mention was made of the fact that our inspectors were resigning to accept positions under the Army because of superior inducements which that service offered.

ELECTRIC DRIVE FOR CAPITAL SHIPS.

One of the outstanding acts of the Bureau of Steam Engineering was its insistence upon the equipment with electric drive of the battleships *California* and *Tennessee* authorized by the act of March 3, 1915. The *New Mexico*, the only capital ship theretofore equipped with electric propelling machinery, had not then been placed in service, but the continued success of the trial installation in the collier *Jupiter*, was so pronounced as to make it seem a matter of duty to take advantage of the superiority which our ships thus equipped would have over similar ships of foreign navies provided with the usual turbine drive.

Similar action was taken in the case of the battleships and battle cruisers provided by the act of August 29, 1916, and this despite the strenuous opposition of one of the contractors for the battle cruisers, and of others more or less peculiarly interested in the adoption of another type of machinery. These contracts were signed in April and May, 1917, but before agreement was reached the strongest kind of influence—exerted through active propaganda over a period of several weeks—was brought to bear upon the department to disapprove the recommendation of the Bureau of Steam Engineering, and to adopt turbine mechanical reduction gear machinery for these battle cruisers. This propaganda manifested itself in letters to the President, in telegrams and letters to the Secretary of the Navy, and in personal interviews with him; in letters to the chairmen of the Committees on Naval Affairs of the Senate and House of Representatives; and in many other ways, including a letter from an eminent professor at a great university, recommending—at the request, he said, of somebody else—that a board of impartial experts be appointed to advise the Secretary what kind of machinery should be installed in these ships.

The subject of electric drive had already received the most serious consideration of the Navy Department, and of those officers responsible for the operation of the ship as a fighting unit, of those responsible for the design of the hull and its protection, and of those responsible for the efficiency of the machinery. It was known to them that it lent itself to the production of a ship having military characteristics superior to those of a ship with any other type of machinery, and as naval opinion was satisfied that it had long since passed the experimental stage, the Secretary of the Navy approved the recommendation of the Bureau of Steam Engineering. This decision has been justified by the superiority which the *New Mexico* (fitted with electric drive) has shown over her sister ships fitted with turbine reduction gear.

GEAR-CUTTING MACHINERY.

It soon became evident that if we were to build a large number of destroyers it would be necessary to greatly increase the gear-cutting facilities of this country. Reduction-gear machinery was of recent adoption and the facilities for its manufacture were very limited, even with those firms who were capable of doing any of it; these being the Delaval Steam Turbine Co., the Westinghouse Co., and the General Electric Co. As the Bath Iron Works had been getting their gears abroad, the bureau decided that the best way to increase our production of gears would be by their manufacture in Great Britain or by the purchase of plans and the manufacture of gear-cutting machinery in this country. Accordingly, steps were taken as follows:

April 21, 1917.—The bureau requested O. N. I. to ascertain from the attaché in London how soon two or more gear-cutting machines could be shipped, and also what delivery could be made of finished gears.

April 23, 1917.—The department communicated with the attaché.

April 25, 1917.—The attaché reported to O. N. I. that 10 sets of gears could be supplied in three or four months if the forgings could be furnished from this country. As the uncertainty of securing such forgings in this country at the time was very great, and as the risk of loss in shipment had to be considered, it was decided that it would be preferable to obtain plans and manu-

facture the machines in this country. The information forwarded by the attaché was confirmed by Admiral Sims under date of April 26, 1917.

April 27, 1917.—The bureau requested O. N. I. to ascertain whether plans of the machines could be obtained.

May 11, 1917.—The attaché reported that drawings for manufacturing gear-cutting machines would be sent as soon as they could be prepared, and the statement was also made that it might be possible to obtain two machines, the British Admiralty having become active in furthering the attaché's efforts.

May 18, 1917.—The bureau requested O. N. I. to inform the attaché that two machines would be purchased and that the drawings of machines were desired.

May 22, 1917.—The attaché informed O. N. I. that drawings could be furnished. The Parsons Co. wrote to the attaché advising that the delicate work on machines be done abroad, and the heavy portions be made in this country, and the machines assembled here.

May 24, 1917.—The bureau requested O. N. I. to instruct the attaché to get drawings and comply with Parsons's suggestion. On the same date the bureau requested the department to ask Rear Admiral Dechair to ascertain whether gears for six destroyers could be obtained in Great Britain within eight months. To this the department replied that it was not then possible to ask this of Admiral Dechair.

June 8, 1917.—The naval attaché wrote the bureau about the drawings that would be supplied.

June 15, 1917.—The attaché reported that the company who were to furnish the drawings expressed an unwillingness to do so and advised that complete machines be purchased.

July 3, 1917.—The attaché reported further that the company repudiates their offer regarding drawings, and he advised purchase of machines. The bureau approved purchase.

July 31, 1917.—The naval attaché reported that the company was proceeding with the manufacture of the moving parts of four machines. Meanwhile, certain drawings had been received, and after much difficulty the bureau enlisted the cooperation of the William Sellers Co., Philadelphia, Pa., in the completion of the manufacture and assembly of the machines in this country. Later it developed that complete machines could be obtained and the agreement with the Sellers Co. was canceled.

DESTROYERS.

At the beginning of the World War in 1914, there were under contract under appropriations made prior to August 29, 1916, 23 destroyers, 7 of which was completed in 1915, 8 in 1916, and 1 prior to April 6, 1917, leaving 7 of the old program uncompleted at the time of our entry into the war.

The acts of August 29, 1916, and of March 3, 1917, made liberal provision for destroyers, the contracts for which were promptly placed and construction proceeding as rapidly as existing facilities permitted. When the act of October 6, 1917, was passed authorizing the construction of 150 additional destroyers, there were then under construction 115, the building of which taxed to the utmost the facilities of the only yards capable of handling such specialized work and required, in addition, the active cooperation of a number of other establishments.

In order, therefore, to make it possible to build 150 additional destroyers in 18 months, as was contemplated at the time, new facilities would have to be created to carry on the work. Several conferences were had with ship-builders, engine and boiler manufacturers, and forgers. Admiral Sims had represented in several communications that any speed greater than 25 knots would suffice for operation against submarines, and it was at first contemplated to give these destroyers a speed of 28 knots instead of 35, the principal reasons for which were that solid shafting might be used, which would greatly simplify the question of production, and that one-half the number of boilers would be necessary. Further consideration in the matter led to the decision to duplicate the destroyers then under contract, which had a speed of 35 knots.

The biggest question that arose in this connection was to supply the forgings for the shafting and the turbines. The Midvale Steel Co. and the Bethlehem Steel Co. were at the time the only establishments capable of manufacturing all the forgings, although the Erie Forge Co. had facilities for the manufacture of most of the sizes. The two former companies were

busy with previous orders and with orders for ordnance material, the Bethlehem Steel Co. having in fact been assigned definitely to Army work and the Midvale Steel Co. to work for the Navy; but as the orders they had for ordnance materials were such as to require the bulk of their product, it was necessary to build at Erie under the direction of the Erie Forge and Steel Co., an entirely new forging plant which could make engine forgings for the destroyers and also gun forgings for the Bureau of Ordnance. The question of time was so important that in laying out the schedule it was found necessary to make additions to the forging plant of the Allis-Chalmers Manufacturing Co., Milwaukee, Wis., to that of the Pollack Steel Co., Cincinnati, Ohio, and to the Camden Forge Co., Camden, N. J., and to allocate to each a definite portion of the forgings required.

The shipyard which had been constructed on a marsh at Squantum was to have no facilities for the manufacture of engines or boilers, and it was therefore necessary to build at Buffalo a shop for the special purpose of manufacturing turbines for the destroyers, which were awarded to the Bethlehem Co. for construction at Squantum.

Although large additions had been made to the machine shops of the Union Iron Works at Alameda, Calif., the facilities were still inadequate for the production of the additional turbines required for the newer destroyers, and as the General Electric Co. had just completed at Erie, Pa., a large shop which, at the time, was without machine-tool equipment, the Navy Department entered into a contract with the General Electric Co. to manufacture the turbines for 40 destroyers, to be built at San Francisco, and equipped the shop for that purpose. It also entered into a contract with the Westinghouse Machine Co. for the construction of turbines for 40 destroyers, to be built by the Newport News Shipbuilding Co. and by the New York Shipbuilding Co. In carrying out this part of their contract, the Westinghouse Co. allotted to the Allis-Chalmers Co., of Milwaukee, the greater part of the machine work. The Cramp Co. of Philadelphia could not take on any more work in their shops, so the Navy Department purchased through the Cramp Co. all the stock of the De La Vergne Machine Co., of New York, and assigned this shop to the use of the Cramp Co. for the manufacture of turbines.

The facilities of the navy yards were also placed at the disposal of contractors for performing much of the machine work on shafting, etc.

The situation with respect to boilers was as acute as that regarding engines, and necessitated the construction at Providence, R. I., of a shop for the express purpose of building boilers for the destroyers at Squantum. The facilities of the Union Iron Works at San Francisco were also increased in this direction by a lease of the Risdon plant to the Union Iron Works, which was utilized for the manufacture of boilers for the destroyers building by that firm. For the 65 destroyers allotted to the Cramp Co., the New York Shipbuilding Co., and the Newport News Co., the Babcock & Wilcox Co., which at the time had large orders for previous destroyers and mine sweepers, as well as for vessels for the Shipping Board, built a large extension to their shop, which increased their facilities to such an extent that they were able ultimately to manufacture a boiler a day.

The manufacturers of pumps were so crowded with orders that they could not take additional work, and after a careful survey of the situation it was decided that the only possible way of obtaining the pumps in time was to remodel the Blake-Knowles plant of the Worthington Pump Co. at Cambridge, Mass., and place the entire order for pumps with that firm.

The order for forced-draft blowers was placed with the Sturtevant Co., of Hyde Park, Mass., and with the Terry Steam Turbine Co., of Hartford, Conn., the order placed with the former requiring a material extension of their works in order to complete the work on time.

In the case of evaporators and distillers, the situation was very much the same as with respect to pumps, and the order for the entire installation was placed with the Griscom-Russell Co., whose works at Massillon, Ohio, were enlarged to take care of this work.

The propellers presented a problem as formidable as any other part of the installation, and the decision finally reached was to enlarge the foundry of the Cramp Co. at Philadelphia and place the entire order with that firm, which had specialized in such bronze castings.

The orders that had been placed with the General Electric Co. and the Westinghouse Co., in addition to the orders they already had from the Shipping Board, were sufficient to monopolize their entire production of reduction gears,

and the only other firms capable of doing the work were the De Laval Steam Turbine Co., of Trenton, N. J., and the Falk, Co., of Milwaukee, Wis. It was at first thought that it would be necessary to enlarge the plant of the De Laval Co., but as work on existing orders proceeded it became apparent that production could be increased to such an extent as to enable this firm to manufacture the reduction gears of the Cramp destroyers without an extension of the plant. In the case of the Falk Co., which was to manufacture the gears for all the destroyers to be built at Squantum, it was necessary to make a material addition to their plant in order to be assured of completing the work on time.

The facilities of the Wellman-Seaver-Morgan Co., at Akron, Ohio, were materially increased in order to enable them to manufacture condensers and other parts of the machinery and hull equipment for these destroyers, and additions to the plants of the Edward Valve Manufacturing Co., Chicago, Ill., the Chapman Valve Co., Indian Orchard, Mass., and the Consolidated Safety Valve Co., Bridgeport, Conn., were made for the manufacture of various valves entering into their construction.

Before we entered the war it was possible to obtain boiler tubes from only one firm in this country, and it therefore became necessary to ascertain the facilities of other tube mills and to formulate a schedule by which these different mills would supply a proper proportion of tubes required in the manufacture of boilers. This was successfully accomplished and no difficulty found in meeting the requirements of the shipbuilders in this regard.

Considerable difficulty was experienced in equipping with machine tools the various new shops that had to be erected and the extensions that had been made to existing shops. Conflict of priority subsequently arose between the Army and the Navy and with industrial establishments, but these difficulties were straightened out after conference and the equipment secured in sufficient time to prevent any material delay in carrying out the activities that had been projected.

Some difficulty was experienced in obtaining large seamless steel pipes and large seamless copper pipes, as there was only one mill of each kind in the country capable of producing these pipes. No considerable delay resulted from this, though in some cases it was necessary to resort to built-up copper pipes in order to meet dates of completion.

The fuel situation which was so acute during the winter of 1917-18 and the extremely cold weather that prevailed contributed in no small measure to retard the building of the new plants under construction for manufacturing the different parts of the destroyers, and thus to have operated as a delay in their construction.

REPAIR OF THE GERMAN SHIPS.

When the United States declared war on Germany on April 6, 1917, all the interned German merchant ships were taken over by the Treasury Department and placed under the immediate control of the collectors of customs of the several ports in which these ships were.

Examination of their machinery disclosed the fact that the engines of all of them were pretty badly damaged. Repairs were proceeding under the general supervision of the Shipping Board in New York, when the engineer officer of the navy yard, New York, Capt. E. P. Jessop, was, in addition to his other duties, assigned to additional duty with the collector of customs in connection with the repair of these ships.

The damage to the engines was of such a serious character that those in charge of the repairs had practically decided that nothing short of renewal of the cylinders would make a satisfactory job. As this would have caused great delay in the completion of these ships and would have greatly delayed their use as troop transports, it was imperative that other means than renewal should be adopted.

The plan to use electric welding for repairing the cylinders was brought to Capt. Jessop's attention and met with his approval, as it did also with that of Rear Admiral Burd, the manager of the navy yard, New York, and was being applied in a limited degree when 16 of these big ships were transferred to the custody of the Navy Department.

As the responsibility for their repair then rested with the Navy Department, instead of with the Shipping Board a careful investigation was made by the department as to the extent of the damage and the plans proposed for their repair. Capt. O. W. Koester was designated as the representative of the Bureau of Steam Engineering to make this examination. His judgment was that the re-

pairs could be satisfactorily made by electric welding, and after a telephone conference between the Chief of the Bureau of Steam Engineering and the industrial manager, navy yard, New York, it was decided to proceed vigorously with the use of electric welding.

The first ship repaired by this method was the *Barbarossa* (*Mercury*), whose repairs were completed at the navy yard, New York. Upon their completion the ship, as was the practice with all succeeding ones, was subjected to a sea trial of 48 hours duration, in order to determine the efficacy of the repairs, and in order that no doubt might exist regarding the safety of troops placed on board these ships. The result proved satisfactory in every particular and all the other ships were repaired in like manner. It is a noteworthy fact that no weakness has ever developed in any of the engines so repaired.

The engines of ships at ports other than New York were similarly wrecked and repairs made either by electric welding, oxyacetylene welding, or by mechanical patching, or sometimes by a combination of two or more of these methods.

Determination of the extent of the damage was in every case a work of most exhaustive and painstaking effort on the part of navy yard authorities, and the fact that nothing escaped detection speaks volumes for the thoroughness with which the work was done. In some cases, important parts of engines were sawed half in two and the cut so carefully concealed as to make detection difficult except by most minute examination. Obstructions were placed in cylinders with the purpose of wrecking the engine as soon as steam was turned on; but this was only one of many of the tricks resorted to that illustrates the working of the German mind in assuming that any engineer worthy of the name would attempt to use the machinery of these ships without making a thorough investigation of every part of it.

In a consideration of the results accomplished in placing these ships in serviceable condition, it should be borne in mind that not only had the engines been damaged beyond repair, as the perpetrators of the vandalism believed, but that their condition was anything but satisfactory owing to the fact that the ships had been laid up for three and a half years and that the machinery had received practically no care during that time. For this reason, deterioration was general and in some cases serious, and the correction of it and the replacement of important parts that had been thrown overboard or otherwise disposed of added greatly to the work of rehabilitation, especially as no drawings were available.

The use of electric welding on such an extensive scale as in the repair of these engines was unprecedented, and the success which attended its use gave an impetus to the art which has probably been far-reaching in industrial work. By its application, it is estimated that at least a year was saved in getting these ships into service and making them available for the transportation of troops to France.

The ships which the Navy repaired and converted to transports and Navy auxiliaries, and their ports of repair, were:

TRANSPORTS.

HELIUM.

The danger to personnel involved in the use of hydrogen-filled balloons was one whose seriousness was generally recognized, but up to April, 1917, nothing had been done to secure a substitute of less inflammability. As soon as we entered the war, the British Government referred to our military and naval authorities various research problems, the solution of which it was believed would assist in winning the war. Among these was that of securing an adequate supply of helium for use in observation and dirigible balloons.

Investigation made before the war showed that considerable quantities of helium existed in the natural gases of Kansas, Oklahoma, and Texas, but up to 1918 none had ever been produced in quantity, and its cost in the small quantities that were available was prohibitive, even for war purposes. However, after consideration of the question by the Joint Army and Navy Aircraft Board, and after consultation with the Bureau of Mines of the Interior Department, it was decided in October, 1917, to assign to that bureau the work of securing helium from the gas of the Petrolia field in Texas, the cost of the undertaking to be borne equally by the Army and Navy, and the interests of the two military departments to be under the supervision of the Navy Department, represented by the Bureau of Steam Engineering.

The Bureau of Mines was confident that it could secure the gas by a new and original process in which it had the utmost confidence of success, and that in doing so the gas would be secured at much lower cost than was possible by existing methods. Realizing the delays consequent upon the development

of any new process, and appreciating the importance of obtaining helium with the least delay possible, the Bureau of Steam Engineering felt that if the gas was to be obtained in time to be of use dependence must be had upon commercial companies whose business it is to market gas. As a result of this, contracts were entered into by the Bureau of Mines for the construction at Fort Worth, Tex., of two experimental plants, one under the direction of the Linde Air Products Co. and the other of the Air Reduction Co., while work on the Norton process by the Bureau of Mines was prosecuted at Petrolia.

The first plant to be completed at Fort Worth was in March, 1918, and the second in May, 1918. After some minor difficulties were overcome, the complete success of one of these plants was assured, as was later that of the other, and at the time of the armistice sufficient "argon," the camouflaged designation of helium, had been produced to enable a quantity to be prepared for shipment to Gen. Pershing's forces.

The experimental plant of the Bureau of Mines was not completed until October, 1918, but did not succeed in getting the gas, though the result secured was encouraging. Certain modifications and additions were found to be necessary, and experiments are at this date (May 1, 1920) still under way, but although the latest test showed a marked improvement, gas of the purity desired has not yet been obtained.

The success of the first plant was so pronounced that the Joint Army and Navy Aircraft Board, in August, 1918, recommended the production of helium in quantity, and in approving this recommendation the Secretary of War and the Secretary of the Navy decided that one agency should do the entire work, and that as the Navy had supervision of the work up to that time, the Navy should act for both departments. Accordingly, a production plant was designed under the direction of the Bureau of Steam Engineering by the organization that first produced helium, and the construction of the plant at Fort Worth placed under the direction of the Bureau of Yards and Docks. The creation of this plant made necessary also the laying of a pipe line from the field to Fort Worth.

SUBMARINES.

The K boats, about whose unsatisfactory condition Admiral Grant testified, were authorized by the acts of June 24, 1910, and March 4, 1911, and contracts were awarded May 31, 1911, and October 27, 1911. Four were built on the east coast and four on the west coast, all from designs of the Electric Boat Co. Their engines were of the two-cycle type and had been unsatisfactory ever since the boats were turned over by the contractors, and every endeavor made to improve their operating condition was without success.

In February, 1917, on account of the more or less unsatisfactory condition following a previous overhaul Admiral Grant recommended that new engines be installed in these boats. This recommendation received the approval of Admiral Mayo, then at Guantanamo, on March 9, 1917, and on March 17, 1917, the Navy Department directed the Bureau of Steam Engineering to take the steps necessary to put the K boats in such condition that they might be "relied upon for active war service at the earliest possible date."

As the installation of reliable engines in the space available would result in a decrease of more than a knot in the speed of these boats, the Bureau of Steam Engineering before placing a contract brought the matter to the attention of the department and asked definite instructions as to whether this reduction in speed would be satisfactory. This was referred to Admiral Grant for consideration, and on April 15, 1917, he reported that the speed would be satisfactory. Meanwhile the Bureau of Steam Engineering had taken steps to ascertain whether engines could be procured promptly, and on May 4, 1917, a contract was entered into with the New London Ship & Engine Co. for eight engines (for four boats) and directed the manufacture of eight others at the Mare Island Navy Yard. The first of the engines under contract was to be delivered in 8 months and all within 11 months. Delivery of those building at Mare Island was to begin December 1, 1917, and to be completed by March 1, 1918.

June 23, 1917.—Operations requested the Bureau of Steam Engineering to recommend 12 submarines for distant service. Among those recommended by the bureau were the K-3, K-4, K-7, and K-8, which at the time were in the Pacific, and in doing so the bureau stated that its preference for those boats was due to the fact that the corresponding boats in the Atlantic had not proved as satisfactory in operation as those in the Pacific.

July 2, 1917.—Operations directed the commander in chief of the Atlantic Fleet to designate the 12 most suitable submarines on the Atlantic coast for distant service.

August 15, 1917.—The department ordered that the four K's and other boats on the Atlantic coast be prepared for distant service.

The four K's arrived at the Azores early in November, much of the trip having been made in bad weather. The commander of the division reported that of these four boats the K-6 made the best record and was ready for duty. K-5 was ready and the K-2 also, but that she was less reliable than the K-5. In the case of K-1 he reported that both engines were entirely disabled, but that material and spares for making necessary repairs were available, and that the four boats were "capable of the duty they are now stationed to perform," and that "good service may be expected of them." The flotilla commander, whose previous experience with submarines had been with the K boats in the Pacific, stated that the K-3, K-4, K-7, and K-8 could have arrived in far better average condition.

July 13, 1917.—The commander of the submarine force, Admiral Grant, reporting on the availability of destroyers, listed the four K's in the Atlantic as being available, and also recommended that no submarines with two-cycle engines (K and L types) be sent abroad.

March 1, 1918.—The commander of the submarine force, forwarding a copy of the report of the commander submarine flotilla 2, dated December 29, 1917, on the voyage of the L-1, L-2, L-10, and L-11, states:

"The performance of the main engine during this voyage will serve as a warning to those who would condemn two-cycle engines on account of their reliability. Such troubles as were experienced were minor and not considered due to the cycles. The flotilla commander's opinion expressed in paragraph 10, 'dated the design of the engines of the K and L classes, though by no means as good as they should be, was better than the material and workmanship that entered into their manufacture and the attendance the engines had received in service' is concurred in by the force commander."

That the department was not unmindful of the necessity of reengining serviceable boats that had the unsatisfactory two-cycle engines may be seen from the following statement regarding the installation of new engines in different types of boats:

E-1.—New engines were installed August, 1916. The contract for the engines was placed in 1915.

E-2.—New engines were installed in March, 1918; the contract was entered into in 1916, but as the engines were built in Sweden, some delay was experienced in getting them to the United States.

F-1, F-2.—Contracts for new engines were made in August, 1916, and the F-3 engines installed in two of them in August, 1917, and in the third in October, 1917.

H-1, H-2.—New engines were installed in August and October, 1918.

H-3.—These engines were ready for installation earlier but were not installed on account of the duty the boats were engaged upon at the time. They had been ordered for K's, and another contract to replace the K engines was made January 4, 1918, delivery to be completed in June, 1918.

K-1 to K-8.—Contracts for these engines as has previously been stated, were made in May, 1917, but as the boats were operating during the war, the actual installation did not take place until 1919, covering a period from May until October.

C-1 to C-5.—Contract for new engines made October 4, 1917.

D-1 to D-3.—Delivery to be made July, 1918.

Of the 18 submarines under construction August 4, 1914, six of the K's were delivered before the end of the year, and seven L's between April and September, 1916, leaving four L's and one M undelivered.

Contracts for further construction were entered into, as follows:

In 1915 for 7 N's and 6 O's.

In 1916 for 10 O's, 6 R's, and 2 S's.

In 1917 for 1 O, 21 R's, and 39 S's.

In 1918 for 10 S's and 6 H's.

The deliveries made under these and previous contracts before the armistice were:

In 1917 1 L and 3 N's.

In 1918 3 L's, 1 M, 4 N's, 15 O's, and 4 H's.

The six boats of the H type ordered in 1918 were boats that had been constructed for the Russian Government. They were purchased in knocked-down condition and assembled at the Puget Sound Navy Yard.

The great increase in the submarine-building program taxed to the utmost the existing facilities for the building of engines and storage batteries, and while the former condition could be met, as it was, by building engines in navy yards, there were only two firms in the country with facilities and the necessary experience for building submarine storage batteries, and as a large number of spare batteries were ordered immediately after our entry into the war, the task set for these two companies was one of gigantic proportions. The situation was, however, satisfactorily met, and at no time was one of our submarines out of service on account of her batteries.

SUBMARINE CHASERS.

In February, 1917, the question of increasing the number of patrol vessels came up for consideration, and this led to the projected design of a boat requiring about 600 horsepower to give a speed of 18 knots. It was known to the bureau that the Standard Motor Construction Co. had furnished engines of 220 horsepower for 80-foot boats for the British Navy, but the adoption of this engine would necessitate the use of three screws, which it was desirable to avoid. The bureau, therefore, on February 19, 1917, addressed communications to the six principal builders of large-size gasoline engines, asking them whether they could manufacture an engine of 300 horsepower, and if so, to give data respecting it, and also the rate at which they could be manufactured.

The replies from all were unsatisfactory, though the Standard Motor Construction Co. expressed the view that their engines of that power would prove satisfactory. It was, however, not in production, and as the 220 horsepower engine had proven satisfactory in the British 80-foot boats, the bureau decided to adopt that engine, notwithstanding the objection to the use of three screws in such small craft. It was, however, believed that reliability of the engine would more than compensate for this disadvantage, and the much quicker deliveries possible with it made its adoption imperative.

Further communication was had with the Standard company up to March 8, 1917, when a representative of that company was asked to confer with the bureau regarding the final arrangement. On March 12, 1917, the bureau asked the Standard company to submit a quotation for engines. This was submitted on March 20, 1917. The Standard company was notified on the 21st that the proposal was not satisfactory and was requested to send a representative to confer in the matter. This conference took place on the 22d, at which an agreement was reached and the proposal of the Standard Co. recommended for approval. The department approved this on the same date, and a draft of the proposed contract was sent to the Standard Co. that day.

The first contract provided for the construction of engines for 150 of these vessels, which later was extended to 462, and made what at first was a comparatively easy order for the contractor a task of great magnitude, the speedy completion of which required the closest attention on the part of the bureau and its inspection force to the placing of orders for material, the following up of such orders, priority of completion and assignment to builders of the hulls, transportation, the supply of fuel and electric power for the contractors and subcontractors, and many other conditions that had a material bearing on the readiness of the machinery as required.

SUBMARINE DETECTION.

In February, 1917, the Bureau of Steam Engineering assembled in Washington a group of scientists to report on the practicability of utilizing magnetic power for the detection of submarines. The scientists composing this group were recommended by the National Research Council and came from the leading universities, where they occupied high positions as physicists. They gave their services without charge and were paid only their actual expenses. The result of the deliberations of this group was a unanimous decision that magnetic detection was of such limited application as to make its use inadvisable for the purpose contemplated, an opinion which later experience during the progress of the war fully confirmed. The members of this board were: Dr. L. A. Bauer, of the Carnegie Institution, of Washington, D. C.; Dr. Ernest Merritt, of Cornell University; Dr. H. A. Bumstead, of Yale Uni-

versity; Dr. A. C. Lunn, of Chicago University; and Dr. H. W. Nichols, of the Western Electric Co.

In March, 1917, at the request of the Bureau of Steam Engineering and through the activity of the National Research Council, the Western Electric Co. carried on experiments with a detection device which had previously been brought to the attention of the bureau.

In May, 1917, the department requested the General Electric Co., the Western Electric Co., and the Submarine Signaling Co. to send representatives to the department to confer on the subject. These three companies had previously done work along this general direction but each operating alone, and it was felt that if cooperation of the three could be secured we should be in a better position to hope for good results. The result of the conference was that the necessary cooperation was promised. Active operations in the development of the listening devices were begun at New London, Conn., and at Nahant, Mass., the groups at each place being under the general control of the commander of the submarine force. At Nahant the work was carried on actively by the Submarine Signaling Co. in cooperation with the General Electric Co. At New London there was assembled a group of scientists to whom were referred all devices which were submitted to the Navy Department and which appeared to possess merit. About this time representatives from France and Great Britain came to this country, bringing with them the results of their experience and in some cases the instruments themselves, and the group at New London prosecuted their work by eliminating all character of work which the Allies had found to be unproductive of good results.

The development work carried on at Nahant and at New London was highly satisfactory and it is recognized that the devices developed by these two groups were by far the best of any that had been used during the war. It is a matter of record that the first installation abroad was responsible for the loss of a German submarine.

An interesting feature of the development of detection devices was that it forced the German submarine to the adoption of means for running as noiselessly as possible, and this in turn forced us to the production of instruments still more sensitive than those first produced. In other words, there was a matching of brains, but as the submarine had reached her limit in slow running submerged our progress thenceforth was real advance toward her destruction; and at the time of the armistice such progress had been made in the development of these devices and their application to destroyers and submarine chasers as to give the fullest confidence in our ability to defeat the submarine.

"EAGLES."

As the war progressed and the demand for antisubmarine craft became more and more insistent, various propositions were submitted looking to the building of more vessels of this type, the facilities for which would have to be additional to any then known to the Navy Department. A summary of the procedure follows:

December 14, 1917.—The Chief of Naval Operations forwarded to the bureaus the characteristics of a 200-foot patrol boat which it was considered desirable to build, and immediate preparation was made for the design of the machinery.

December 23, 1917.—Mr. Henry Ford offered the facilities of his establishment not otherwise employed for the building of patrol vessels.

December 24, 1917.—The department informed Mr. Ford that the proposition interested us, and requested that he send some of his engineers and production men to confer with the designers of the Navy Department and get full information, in order that he might be in a position to submit a definite proposition.

January 10, 1918.—The bureau advised Operations that Steam Engineering was proceeding with the design of machinery for the vessel whose characteristics had been furnished.

January 12, 1918.—A conference was held at the Navy Department which was attended by Mr. Henry Ford and some of his designers, by the engineer in chief, and Rear Admiral Dyson, and by the chief constructor and Naval Constructor Stocker. The outlined plans of the proposed boat were shown to the Ford people and an interchange of views was had with them. Their ideas in regard to the type of machinery that was suitable for such a boat were very

crude indeed, and it early became evident that they were unfamiliar with the design of machinery suitable for such vessels. They were, however, responsive to our suggestions and accepted our judgment in the matter when the circumstances were explained to them. They were advised to get in touch with the Poole Engineering Co., of Baltimore, Md., whose turbine appeared to possess greater merit for this particular service than any other known to the bureau. They were advised that the bureau would furnish the design of boiler and would assist them in the preparation of plans and render such other assistance as might be necessary.

January 14, 1918.—The Bureaus of Steam Engineering, Construction and Repair, and Ordnance made a joint report to the department recommending the construction of the 200-foot boat whose design had been in preparation.

January 14, 1918.—Mr. Ford wired that he could build boats and gave a schedule of construction beginning in five months and working up to 25 a month three months thereafter. He also stated the estimated cost of the boats, but particularly emphasized the fact that he was not a shipbuilder and would not care to be held to his estimate.

January 18, 1918, to January 30, 1918.—The bureau was in almost daily communication with the Poole Engineering Co. either by letter or by telephone fixing upon the details of the engine installation.

January 18, 1918.—Award of contract was made to the Ford Motor Car Co. about this date, and Admiral Dyson and Naval Constructor Stocker were ordered to Detroit to look over the plant and advise regarding construction.

March 1, 1918.—The contract was signed for the construction of 150 boats. The act authorizing the construction was dated March 4, 1917.

As these vessels were to be used exclusively for operation against submarines, special provision was made in the preparation of the design of the machinery, to eliminate as far as practicable all reciprocating machinery, both main and the auxiliary machinery, in order that the listening devices with which they were to be equipped would be affected the least possible by the noises within the vessel itself. The result of the trials of these vessels shows that this was accomplished in a very satisfactory manner.

MINE SWEEPERS.

The act of March 4, 1917, provided for the construction of numerous small craft, including mine sweepers; and as all the principal shipbuilding yards were working to capacity, considerable difficulty was experienced in placing the orders for 36 sweepers, subsequently increased to 54.

The design of the machinery would have consumed valuable time if a new design had to be made, and after making inquiry of various shipyards it was decided to utilize a design which had been used by the Harlan & Hollingsworth branch of the Bethlehem Shipbuilding Corporation and which, though not exactly what was desired, could be made suitable for the purpose.

A contract was entered into with the Harlan & Hollingsworth Co. for the preparation of plans and patterns, for the placing of orders for the principal material, and for its delivery to the various building yards when required. Contracts for 36 sweepers were made from June to September, 1917, and for 18 others October, November, 1917, and September, 1918, and the work carried on without delay, although progress was much slower than we had hoped for and much slower than the builders had anticipated.

TUGS.

There was a great demand for seagoing tugs during 1917; but as the most powerful and most desirable ones were engaged in coastwise traffic, transporting coal from Hampton Roads to New England ports, the diversion of these tugs, especially during the severe winter of 1917-18, could not be considered without entailing great hardships and perhaps seriously interfering with the production of munitions. As tugs became available they were purchased, and whenever building facilities could be found either at navy yards or at private establishments they were availed of for the construction of tugs. Orders for two seagoing tugs were placed with a Lake firm in May, 1917, and other orders to the number of 17 with navy yards and others in May and June, 1918.

Orders were also placed about the same time for 40 wooden harbor tugs to meet the demands of the large fleet of N. O. T. S. vessels.

MAINTENANCE IN EFFICIENT CONDITION OF THE MACHINERY OF THE FLEET.

To maintain the machinery of the fleet in efficient operating condition was a task of the greatest magnitude. It not only involved caring for the purely naval vessels that constituted the fleet before the war but also for the hundreds of merchant ships that had been transferred to the Navy for operation, for the yachts and patrol vessels assigned to duty in home and foreign waters, and for the submarine chasers and mine sweepers that had been added in such large numbers. To do this entailed a vast amount of work in acquiring detailed knowledge of the machinery of this heterogeneous combination of ships, and when this was obtained it involved decision as to the kind and the quantity of special material that it would be necessary to carry in stock in order to meet the demands of service at home and abroad. Then followed preparation of requisitions for material, following up while under manufacture and keeping a record of its whereabouts after delivery. The whole duty involved organization of the highest order and was carried out in the most satisfactory manner.

The facilities of the navy yards were expanded and the fullest use made of the available facilities of private establishments in order to keep ships in condition. For the destroyers and patrol vessels operating abroad first one, and ultimately six repair ships were detailed to this important work. These vessels rendered service of the greatest value, and without them it is safe to say that it would not have been possible for our destroyers to have made the wonderful record for efficiency that is accorded them on all sides. Admiral Sir Lewis Bayly, R. N., who was in command at Queenstown, has this to say of them:

"Without these repair ships the work could never have been done. Working full 24 hours in three shifts of 8 hours each, sleeping among the noises of the machinery, always ready for extra work when an unexpected accident happened or an unforeseen call was made on a destroyer that was being dealt with, they never failed me. Capt. J. F. R. Pringle, of the *Melville*, and Capt. N. B. Price, of the *Dixie*, were not only always ready to do the expected but used their utmost endeavors to be prepared for the unforeseen, and the result was such as their country has reason to be proud of."

At this end of the line requisitions were promptly made for material such as would be in greatest demand by the repair ships, and the closets liaison maintained between them and the repair division of the bureau. When, as happened on more than one occasion, a destroyer was seriously damaged by a submarine or in collision, replace parts were either ready at the base or on this side ready for shipment before the hull was repaired sufficiently to admit of their installation.

Boiler and condenser tubes were provided in quantity sufficient to meet every demand, and as illustrating the capacity of the repair ships and the cooperation of the destroyers, it may be mentioned that the retubing of the boilers of a destroyer was carried out by a repair ship without loss of a day from her patrol duty, by taking advantage of the rest of four or five days in port following periods of cruising, and that during this time the destroyer was capable of making upward of 25 knots at any time.

Besides taking care of the convoy and patrol vessels, the repair ships rendered invaluable assistance to merchant ships of our own and allied countries, and assisted materially in keeping them in operating condition.

In order that destroyers might not be subject to enforced periods of inactivity due to boiler casualties, orders were issued in April, 1917, for the manufacture at each of four navy yards a set of boilers (four) suitable for any destroyer then in service. The wisdom of this was later evident when the boilers of one of the Queenstown destroyers needed retubing; new boilers were so nearly ready that the Bureau of Steam Engineering recommended to the department that the vessel be brought home and the new boilers installed, when retubing of the old ones could be undertaken and the boilers made ready for installation in another destroyer. The commanding officer preferred to remain abroad and have the new boilers shipped out, but as this procedure would have consumed valuable cargo space and would also have exposed the boilers to loss by submarine attack, the department approved the recommendation of the bureau and ordered the vessel home. Renewal of the boilers was effected in less than seven weeks.

To supplement the work of the repair ships, five major repair bases were established abroad, three in France, one in Great Britain, and one at Gibraltar,

with two minor bases in the Mediterranean. The tool and material equipment for these bases was provided by the Bureau of Steam Engineering.

The work of supervising the repairs to the machinery of the fleet was greatly facilitated by the installation of special wires to each navy yard, which enabled instructions to be given by phone, which later were confirmed by letter, a practice which subsequently was generally adopted throughout the department.

The work of the east coast navy yards during this period is beyond praise, and where all worked so willingly and so successfully it would be a disparagement to single out one for special mention. The west coast yards, though far from the scene of activity, and not called upon to assist in the maintenance work, contributed their share to the general good in reconditioning German ships and in building destroyers, submarines, submarine chasers, and mine sweepers.

WIRELESS TELEGRAPHY.

The radio work of the Bureau of Steam Engineering has always been recognized as occupying a foremost position in the radio world, and much of the progress made in recent years has been due primarily to its initiative. In order to be prepared to place the material of our radio communication service in the condition which actual war conditions demand, Lieut. Hooper, as previously stated, was sent abroad in August, 1914, to study, as best he could under the restrictions placed on neutrals, the methods followed in conducting radio communication. Being an expert operator, as well as skilled in the technique of the art, he was able to "listen in" in Great Britain, France, Holland, and Belgium (in the portion at the time in German possession) and thus to acquire valuable information regarding methods of communication. His conclusions were that, so far as material was concerned, we were fully as well equipped as were the nations at war, and that their only point of superiority was in methods of communication, a feature of the service which does not pertain to the Bureau of Steam Engineering.

After we exercised a censorship in September, 1914, over messages transmitted by high-power radio stations, considerable work was necessary on the part of the bureau in connection with the maintenance of the force engaged in censorship; and when in November of that year there was a serious breakdown of the transmitting apparatus at Tuckerton, the interests of the United States in transoceanic radio communication were considered of so much importance as to cause the bureau to transfer from Arlington to Tuckerton transmitting apparatus which enabled the station to continue operation.

After our entry into the war the absolute control of all radio stations passed to the Government. This meant responsibility by the bureau for the efficient operation of all stations whether high power or low power, and resulted ultimately in the final acquisition by the Navy Department of all coastal stations owned by the Marconi Co. and by the Federal Telegraph Co., the latter including as well the high-power stations of that company at San Francisco and at Honolulu. With the purchase from the Marconi Co. went also the ship stations maintained by that corporation, which at the time were limited almost entirely to some vessels of the Shipping Board and the Railroad Administration. These duties were also extended to the equipment with radio of all ships under control of the Shipping Board, and to all patrol and auxiliary vessels acquired by the Government. Broadly speaking, it may be said that the duties of the bureau in connection with radio covered every vessel that flew the American flag and all naval aircraft. The number of installations exceeded 4,000.

The serious results that might follow cutting the cables pointed to the necessity for the construction of additional high-power stations for maintaining communication with our forces in France. To carry this into effect, the bureau designed and equipped at Annapolis, Md., a high-power station which was completed in the late summer of 1918, and designed another still more powerful to be erected at Monroe, N. C., and had made plans for its construction when the armistice put an end to further negotiations. As a complement to the Annapolis station, the bureau, at the request of the French Government, designed and provided the equipment for a powerful station located near Bordeaux, France. The construction of this station was well under way at the time of the armistice, and at this date (May 1, 1920) is nearly ready for operation. The work of constructing the towers and buildings at these stations was under the direction of the Bureau of Yards and Docks; the foundations for the station near Bordeaux were furnished by the French Government.

Another high-power station, though less powerful than the Annapolis station, was designed and erected at El Cayey, P. R., in order to assist in communication work.

In addition to this new construction, the bureau made important improvements to the German-owned Sayville station after its acquisition from the Allen Property Custodian, and also to the Marconi station at New Brunswick, N. J., which late in the war became the best of our high-power stations.

The need for radio communication with our troops in eastern Siberia made necessary the equipment of an abandoned Russian station at Vladivostok. The equipment for this station was hurriedly assembled, most of it being taken from one of the stations at Hawaii which had been purchased from the Federal Telegraph Co. and transported by the *Saturn*, which also carried the personnel necessary for its erection and for operating the station. The successful completion of the undertaking was a very creditable piece of work.

Some of the most noteworthy radio developments of the war in which the bureau was intimately concerned were:

(a) The radio compass, which enables a vessel at sea to obtain her accurate position in any kind of weather, and also to locate other vessels having radio equipment. This work dates from the early part of 1916, and the first ships were equipped with it early in 1917. The application of this principle to aircraft followed and was notably successful in the flight of the NC-4 from the Azores to Lisbon.

(b) Radio for aircraft, which developed from practically nothing to apparatus capable of transmitting a distance of 200 miles. In this work the officers and employees at the aircraft radio laboratory and at the radio test shop played a very important part.

(c) The radio telephone, the first installations of which were made on the *Arkansas* and *Florida* in February, 1916, following the same general plan as that used in the demonstration by the Western Electric Co. in 1915. Other installations followed soon thereafter, and later the Western Electric Co. designed the improved type which was installed in our submarine chasers and elsewhere.

(d) Underground and underwater radio experiments were carried out early in 1917, and development made of the underground system suggested by Mr. J. H. Rogers, resulting in the application of the system to several distant control stations. Experiments in 1918 on underwater radio, in cooperation with the Bureau of Standards, resulted in greatly improving the transmitting and receiving radio of submarines.

The operation of our ships in European waters with the fleets of the Allies made necessary many changes in the type and arrangement of the radio equipment of our vessels, and also the establishment of repair and supply facilities at naval bases abroad. These repair bases not only cared for the wants of our patrol and convoy vessels, but also for those of transports and supply ships, and rendered necessary a high order of ability in the operating personnel. One was established at Queenstown, one at Gibraltar, a third at Brest, and others at seven other places in France, one at Plymouth, and one at Corfu, the latter to care for our submarine chasers in the Adriatic.

Perhaps the most comprehensive idea of the increase in volume of radio work on account of the war may be gained from the statement that before the war the Bureau of Steam Engineering was responsible for the material condition of 49 coastal stations and ship stations, and that at the time of the armistice these figures had grown to 229 and 3,775, respectively, while the high-power stations had increased in number from 5 to 15 in operating condition, and two more under construction.

AVIATION.

The small volume of business transacted before 1917 may be inferred from the statement that, at the beginning of the war, the personnel of the Bureau of Steam Engineering engaged in such work comprised one officer and one stenographer, with three officers on inspection work in the field. As the aviation policy of the department shaped itself, it became apparent that a large expansion would be necessary with an organization suited to the special requirements. Qualified personnel was not to be had, and so recourse was had to the expedient of selecting from the reserves young men with a predilection for mechanical engineering, sending them to the Massachusetts Institute of Technology for an intensive course in engineering that had been

established there under the direction of the Bureau of Navigation, thence for a short tour of inspection at airplane or engine factories, and then to the bureau, where they were required to specialize in one particular part of the power plant equipment. By this method, and by the addition of two regular officers, the force engaged in this work grew to 40 officers and 60 clerks and stenographers, and did very satisfactory work.

Somewhat similar action was taken to secure qualified officers for handling hydrogen gas. The Bureau of Navigation established a school at the naval air station, Rockaway, Long Island, and thither were sent young reservists who had had experience in the generation and handling of the gas. Upon completion of the course, they were assigned to air stations from which dirigibles were operating.

A careful survey of the aircraft engine field showed that there was not in this country at the beginning of the war an engine that had been developed, or that was in process of development, that met the requirements of military service. Nor was there available abroad an engine of sufficient power and proven reliability that could be transplanted and put in production in time to be of real service. All reports from abroad pointed to the need of engines of greater power than those in use, and as the military advantage to be gained from having but one type of engine was of the greatest consequence, it was early decided to adopt the Liberty engine, which had been designed under the direction of the Aircraft Production Board, of which the aviation officer of the bureau was a member. The wisdom of the decision was fully confirmed in service.

It was necessary to provide engines for training planes, and these were purchased in quantity from manufacturers of lower-powered engines. The difficulty in obtaining a supply of spare parts occasioned much delay and vexation at training stations, and this was relieved only when the bureau itself established sources of supply independent of the manufacturers of the engines.

The design of propellers suitable for the Liberty engine was a problem of no small magnitude, but was satisfactorily solved after a few trials, and thereafter production kept up with demand. Serious problems, however, arose in connection with their packing and their transportation abroad, but these gradually disappeared as experience dictated changes in methods.

Important work was done by the bureau in the development of the geared Liberty engine; in the design of radiators; in the design of hand and electric starters; in the design of leak-proof gasoline tanks; and in the development of a steam-power plant for aircraft.

In addition to the 10 air stations in this country, the department established 20 such stations abroad, all of which required detailed attention in connection with their maintenance and operation, as did also their equipment with machine and hand tools.

SUPPLY OF MATERIAL.

It early became apparent that the problem of obtaining engineering material and supplies, both for the direct use of the Navy and for those having contracts for new construction, would be one difficult of solution and of increasing complexity. Owing to the unsettled labor conditions the prewar forms of contracts prescribing penalties for failure to complete contracts on time had to be abandoned, and, in many cases, contracts had to be changed from a fixed price to a "cost-plus" basis. This and the steps taken to guard against sabotage made necessary increased vigilance on the part of inspectors and an increase in the number over that which would have been required under the usual prewar conditions. Naturally, the new men taken on were more or less inexperienced, which condition in itself increased the responsibility of the inspectors in charge, many of whom were retired officers, and all of whom rendered service of the highest order.

The demand for material increased tremendously, owing to the requirements of new Government activities as well as those of a private character closely affiliated with Government work. This led to the creation of the War Industries Board, with its priorities commission (or board), through which the resources of the country were controlled and material directed into channels where it was most needed. This meant that the Navy's engineering requirements had to be most carefully studied in order that delivery might be secured, when and in the same manner required, and also that unnecessary or unreasonable demands might not be made to the detriment of other essential war activities.

Questions of priority were continually arising, and, in order to keep in closest touch with the production of material, it soon became necessary to have in the field of manufacture officers whose sole duty it was to follow up orders and to see that orders of priority were observed. Accordingly, a number of business men of ability—all over draft age—who were willing to devote their time to Government needs, were enrolled as officers in the reserve and detailed to this important duty, which they discharged with conspicuous ability. A corresponding "follow-up" section was established in the bureau, through which it was possible always to know the exact status of all important engineering material under contract.

In some cases it was necessary to summon manufacturers to Washington in order the better to understand the situation and to arrive at a plan of procedure that would be mutually satisfactory. They responded cheerfully to every demand, and by close cooperation the least confusion possible was experienced.

FUEL.

The inspection of fuel and the determination of its quality are duties assigned the Bureau of Steam Engineering, and it was soon realized that it would be impracticable and undesirable to supply "Navy standard" coal to all the vessels that had been taken over for operation. Investigation was accordingly made of mines not on the acceptable list and another list prepared of mines whose product would be acceptable for auxiliary vessels of the Navy and for merchant ships manned by the Navy. This procedure was satisfactory in securing coal which, though not equal to that supplied the fighting ships, proved satisfactory for the ships to which it was assigned.

Modifications were also made in the fuel-oil specifications in order to meet the requirements of merchant ships fitted with oil-burning equipment, and in the specifications for gasoline in order to provide a high grade for aviation purposes, and at the same time, by the use of a lower grade for other purposes, to permit of greater production in order to meet the ever-increasing demand for gasoline at the front. These modifications were made in conference with the Fuel Administration and with other agencies of the Government concerned in the use of oil and gasoline.

PERSONNEL.

In accordance with the mobilization plan outlined in 1915, retired officers reported promptly at the bureau and at inspection offices before the declaration of war and took up either the duties of active officers who were ordered to sea or assisted in carrying out the increased work of those who perforce remained. As the work grew, it became necessary to add reserve officers whenever those of suitable qualifications could be secured and also to draw on the Coast Guard for officers of engineering training.

The lack of a sufficient number of qualified electrical officers who could be spared for that special work induced the bureau to recommend to the department the enrollment in the reserves of 100 graduates of technical colleges as officers for electrical duty. The details were carried out under the direction of the Bureau of Navigation and resulted in the addition to the service of a fine body of specialists, many of them relinquishing positions of great responsibility to serve in the Navy.

The demand for clerks increased in proportion to the work and could have been met in no other way than that adopted—enrollment in the reserves of female clerks, with the rating of yeoman (F). Later Congress authorized additional employees, who were supplied through the Civil Service Commission. The total number of employees engaged in clerical, messenger, and technical work in the bureau at the time of the armistice was 559, of whom 280 were yeomen (F), and it is a pleasure to testify to their industry and efficiency during the entire period of the war.

R. S. GRIFFIN, *Chief of Bureau.*

IMPROVEMENT OF INDUSTRIAL PLANTS.

In addition to the industrial plants specifically mentioned in connection with the construction of destroyers, improvements in which the Bureau of Steam Engineering was concerned were made at the following plants, either to forward

the construction of naval vessels or to facilitate the production of material or equipment for them:

Union Iron Works, San Francisco, Calif.
Columbia Steel Co., Pittsburgh, Calif.
Bath Iron Works, Bath, Me.
Bethlehem Shipbuilding Corporation, Quincy, Mass.
New York Shipbuilding Co., Camden, N. J.
Wm. Cramp & Sons Ship & Engine Building Co., Philadelphia, Pa.
Newport News Shipbuilding & Dry Dock Co., Newport News, Va.
Ford Motor Co., River Rouge, Mich.
Ford Motor Co., Kearney, N. J.
Lang Propeller Co., Whitestone, Long Island, N. Y.
The Falk Co., Milwaukee, Wis.

Secretary DANIELS. During the year 1913 a study was made of the needs of the Naval Establishment in the way of communications, and as a result a memorandum was submitted by the Superintendent of Radio Service in March, 1914, outlining in a general way the principles upon which the service should be administered, operated, and maintained. After the fullest discussion and comments by the commanders in chief of the various fleets and the General Board, an official board was appointed by the Secretary of the Navy on December 5, 1914, for the purpose of organizing the Radio Service along lines that would meet the requirements of the Navy both in time of war and time of peace. The report of this board, which went into very considerable detail, was submitted to the department in February, 1915. The report of the board was approved by the Secretary of the Navy on May 25, 1915, and the process of building up the organization to meet the specifications outlined in the report was proceeded with as rapidly as personnel and material permitted. A summary of the projects considered and provided for in the board's report follows. Without this communication service we could not have kept in touch. I have here one of the most illuminating stories of war service—of this new department of communications. If the Navy had done nothing but what it did in communications, it would have been an outstanding honor to the Navy for all time. Why, it handled, by leased wire—Western Union and Postal—53,000,000 messages; by high-power radio, trans-Atlantic and continental, 16,000,000 messages; and by coastal radio 1,621,000 messages; and when the war was over this service enabled Mr. Hoover to make his plans for feeding the starving people of the countries of which he was selected by the Congress of the United States to be the almoner. I will not read this, Mr. Chairman. It is a very illuminating story, and it is accompanied with a map, a blue print; and here is the naval organization of the radio.

The CHAIRMAN. Are those to be filed with the committee?

Secretary DANIELS. Yes.

The CHAIRMAN. Are they to go in the record?

Secretary DANIELS. I would like to have them go in the record. I think that was one of the greatest contributions of the Navy during the war.

(The documents referred to are here printed in the record as follows:)

- I. General statements of policy.
- II. Organization of operation, afloat and ashore:
 - A. Wave-length assignment, with explanation of system.
 - B. Communication districts.
 - C. Calling and working wave lengths.

- D. Location of stations, having due regard for protection and efficiency.
- E. Organization for administration.
- F. Communication offices.
- G. Use of land wires and cables in conjunction with radio.
- H. Alternate methods for use in case either radio or wire communication, or both, are destroyed.
- I. Organization of commercial radio stations in war.
- J. Use of radio by merchant ships in war.
- K. Use of radio by Army and Transport Service.
- L. Use of radio by Coast Guard Service.
- M. Use of radio by Naval Militia.
- N. Use of radio by State Department.
- O. Use of radio by Marine Corps.
- P. Use of underwater signaling.
- Q. Assignment of radio stations to supply yards for maintenance, and to naval-defense districts for administrative control.
- R. Temporary organization, pending adoption of service to ultimate plan.
- III. Cooperation with other departments.
- IV. Personnel:
 - A. Complements of officers, with discussion.
 - B. Post-graduate course for officers.
 - C. Radio gunners.
 - D. Complements for ships, shore stations, etc., officers, civilians, and enlisted men.
 - E. Number of enlisted men required from electrical classes.
 - F. Rotation of duty for enlisted men.
 - G. Qualifications for enlistment and advancement of enlisted men.
 - H. Training of enlisted personnel.
 - I. Nomenclature of personnel.
 - J. Personnel for submarine and air craft.
 - K. Reserve Radio Corps.
 - L. Summary.
 - V. Material:
 - A. General policy.
 - B. Equipment of stations and ships—general plan.
 - C. Changes necessary in apparatus to accommodate: (1) Temporary organization; (2) ultimate organization.
 - D. Battle equipment for ships.
 - E. Tune shifters.
 - F. Wired wireless outfits.
 - G. Break keys.
 - H. Removal of after cage masts from capital ships.
 - I. Direction finders.
 - J. Protection of magazines from danger due to radio.
 - K. Radio for air craft.
 - L. Submarine antennæ masts.
 - M. Personnel for research work.
 - N. Quarters for personnel.
 - O. Portable radio apparatus.
 - P. Division of Steam Engineering allotment in navy yards for radio work.
 - Q. Assignment of radio stations to navy yards for maintenance.
 - R. Underwater, or submarine, signal equipments.
 - S. Capacities of manufacturing companies in war time.
 - T. Buzzer sets for ships and stations.
 - U. Simultaneous sending and receiving for flagships.
 - VI. Regulation books, code books, blanks, etc.:
 - A. Radio regulations book; commercial traffic regulations.
 - B. Code books, use of code and cipher.
 - C. Radio signalling; battle signal book.
 - D. Method of reporting position by scouts.
 - E. Secrecy of codes.
 - F. Existing method for transmission to and from shore not a war method.
 - G. Changes in form for radiogram transmission.
 - H. Blanks for official messages.
 - I. Changes in Navy Regulations.
 - J. Changes and additions to Naval Instructions.

K. Text book for material.

VII. Miscellaneous:

A. Separate commander for scouts.

B. Recommendations for apportionment of long wave lengths and other matters to be brought before the next international radio conference.

C. Legislation recommended to increase the efficiency of radiotelegraphy in the United States.

The attached blue print indicates the comprehensive scope of the system outlined.

In May, 1916, a supplementary board on reorganization of this service was convened in the Navy Department, with a view to embodying such changes as appeared desirable as a result of experience gained during the year past. It had been recognized for some time that the best service could be furnished by having all naval communication activities combined under one office, and the recommendation of the supplementary board that the name of the Radio Service be changed to the Naval Communication Service, was approved by the department in 1916, and all forms of naval communications were placed under the administrative jurisdiction of the director naval communications. At the same time the office of the director naval communications was placed under the Chief of Naval Operations.

As there was no detailed plan in existence for communications within the naval districts a plan was submitted by the office of the superintendent of Radio Service, early in 1916, outlining in considerable detail the methods for communicating information within and between naval districts. This plan was approved by the department in June, 1916, and furnished the groundwork for communications in naval districts during the war.

A very valuable experiment was carried out by the Navy Department in May, 1916, in which all the naval stations within the continental limits of the United States were connected up to a central telephone switchboard in the Navy Department, and by means of which instant telephonic communication could be had between the various naval stations and the Navy Department, and also among the stations themselves. This was made possible through the assistance of the American Telephone & Telegraph Co., and its value later on, when this country declared war against Germany, was clearly proven. It was during this test that the commandant of the navy yard, Mare Island, Calif., talked by telephone to the commanding officer of the battleship *New Hampshire*, which was then at sea off the Virginia Capes. The commandant's remarks came by long-distance telephone from Mare Island to Arlington, where the transmitting station was installed, and from there out to the *New Hampshire* off the Virginia Capes. The greatest value derived from this experiment, aside from the knowledge that such rapid communication by telephone was available to the Navy Department, was the fact that all of the apparatus necessary was specially marked and could be placed in operating condition on 24 hours' notice. As a result, the interior communications of the country, so far as naval needs were concerned were, on the outbreak of the war, in excellent operating condition, and made the task of the Navy Department, in communicating its instructions and orders to the various naval stations, a comparatively simple one at the time of the declaration of war.

On January 1, 1917, the naval communication service operated 55 radio stations, distributed along the coast of the United States and its possessions. Naval vessels were equipped so that they could receive only one message at a time. Not all of the American merchant vessels were equipped with radio apparatus, some were equipped with poorly designed radio apparatus, and none of their radio operators were proficient in the procedure of communications during war. The Navy had only 1,031 radio operators in its service.

The radio technical equipment of the Navy was as good as any in general use in the United States at the time, but the demands for communication proved that the technical equipment would have to be increased and improved to conduct all of the necessary communication demanded in time of war.

At the beginning of the war the demands for quick communication increased by leaps and bounds. It was found necessary to communicate with ships in all parts of the world, while at the same time to maintain long-distance communications between the Navy Department and our outlying possessions and expeditionary forces. It was necessary to maintain continuous and rapid communication between the Navy Department and Europe, South America,

Central America, West Indies, Pacific coast, Hawaiian Islands, Guam, Tutuila, and the Far East. The most important centers of communications were at Cavite, P. I., Hawaiian Islands, Canal Zone, Washington, D. C., and the capitals of the allied nations in Europe.

To meet the demands for communication the Navy's facilities were greatly and rapidly increased, and means were provided for collecting and disseminating information to every part of the coast and to naval vessels in Europe, South America, and the Far East.

The Navy took over and operated 59 commercial stations. At the same time the several privately owned stations were closed, including all the stations operated by the amateurs, which were not necessary nor desirable for use during the war. Sixty-seven land radio stations were built by the Navy during the war, all equipped with the best apparatus, this more than doubling its radio facilities on shore.

Naval vessels were equipped with improved apparatus, so that when the armistice was signed battleships were able to receive four messages simultaneously and transmit three. The commander in chief of the fleet could talk to the captains of vessels in the fleet, while at the same time the various ships of the fleet could communicate with one another. In addition, and at the same time, airplanes could communicate with their respective battleship units.

The Navy Department equipped all American merchant vessels with modern apparatus and furnished operators for them, so that these merchant ships could receive messages at any time of the day and transmit messages at long distances in case of distress.

The Navy had to train most of its radio men, because the radio amateurs in this country were soon incorporated in the Army and Navy. These operators were trained at Harvard. In June, 1917, there were 350 students under instruction. When the armistice was signed there were 3,400 men under instruction, and operators were being graduated at the rate of about 200 a week. A total of about 7,000 operators completed their training. In addition to the radio operators it was necessary to train officers for communication duties on board the ships. At the time the armistice was signed each ship of the Navy had a communication officer, and each merchant ship had a chief petty officer, who performed communication duties and therefore relieved the master of the ship from a very vexatious duty.

The year before the war there was handled approximately 125,000 dispatches from the Navy Department. These dispatches averaged about 25 words each.

From April 6, 1918, to April 6, 1919, approximately 1,000,000 dispatches, of an average of about 30 words each, were handled from the Navy Department alone. Some of these dispatches, on account of the necessity of broadcasting, were sent twice in order to insure their delivery.

As it was assumed that the use of radio apparatus by ships at sea enabled German submarines to ascertain more or less accurately the movements of such ships, communication by radio from merchant ships was discontinued except in case of emergency. Men of war were cautioned not to use their radio apparatus unless necessary. However, it was very necessary that information should be received on shore regarding the movements of the enemy, and that the consequent orders to ships at sea should be transmitted expeditiously. Therefore, in order to direct the movements of convoys, and to transmit information to naval vessels regarding the enemy, and to issue orders to both merchant ships and naval vessels, a comprehensive system of transmission from shore was organized with the view of making it necessary for ships at sea to use their radio apparatus.

All merchant vessels listened for their orders from certain designated shore stations during certain hours of the day. These messages were sent by high-power and low-power stations, depending on the distance of the ship from shore. Naval vessels intercepted messages from shore stations at all hours of the day. In order to send a message to a naval vessel at sea it was necessary only to transmit from certain shore stations on a designated wave length. It soon became evident that this was a very sure means of communication. Many times 50 or 60 messages were transmitted to sea simultaneously, all destined for different classes of vessels, and they were received by ships in accordance with the plan.

The foregoing system demonstrated that ships at sea could be warned of mines and submarines and their movements directed without the necessity of their

using their own radio apparatus. The system was automatic to such an extent that it was almost certain that a vessel could be reached at any time.

In order that errors in this system might be eliminated, and in order that the Navy Department might be informed of the movements of vessels, there was established a shipping information service. A confidential bulletin was published showing the movements of all United States vessels and as many foreign vessels as could be obtained. This information was collected from all the important ports of the world and the data printed in a booklet. This service grew to such an extent that the booklet now contains the names of approximately 12,000 vessels, their arrivals and departures, character of cargo, and destinations, and is of much value to shipping and business interests. It is the present plan of the naval communication service to continue this publication until Congress makes other disposition for its publication.

In order to check the radio work of merchant vessels, a comprehensive system of inspection was organized, both in the United States and abroad. Every merchant vessel that came into port received a thorough inspection of its radio apparatus, and the radio operators were examined and thoroughly instructed. Any mistake indicated in the log books was investigated and the operator instructed as to the correct method of handling such cases.

Besides inspections, the Navy maintained a comprehensive system, both at home and abroad, of radio repair stations. Any radio apparatus aboard ship which had broken down was repaired when the ship came into port.

It soon became evident that if the commander of the United States forces in Europe was to maintain close touch with all of his forces it would be necessary to establish and control a complete system in Europe. To this end cables were laid and land wires and radio stations constructed in France, England, and in Italy. The Navy used a great many of these land wires and cables that were constructed by the Signal Corps of the Army. Close cooperation was maintained with the allied communication service with a view to utilizing their systems whenever possible and with the view to avoiding duplication of effort. During the war it was found necessary to maintain radio communication between the United States and our naval and military forces in Europe and in other parts of the world. In October, 1917, the allied military and naval officials had a conference to determine the best methods of operations that were to be used in maintaining communication between the United States and Europe in case the cables were either cut by the enemy or otherwise placed out of commission.

It was decided that the United States would use the radio stations at New Brunswick, Annapolis, Tuckerton, and Sayville for transmission purposes; but at this time none of these stations was in reliable communication with Europe at all times of the day and year. Therefore, it was necessary to increase the power of Tuckerton and Sayville and to place more modern apparatus in the New Brunswick. The radio station at Annapolis had not been completed, and orders were given to rush the construction. There were only two trans-Atlantic receiving stations, viz, one at Chatham, Mass., and one at Belmar, N. J.

In Europe the only radio stations available for use in transoceanic communication were those at Rome, Italy; Lyons, France; and Carnarvon, Wales. Of these stations, the one at Lyons, France, was the only one able to communicate satisfactorily with the United States.

None of these stations was equipped with high-speed apparatus, and none was equipped in such a way as to avoid intentional interference from radio stations in Germany, and the systems of operation and control were not such that large volumes of traffic could be handled.

At first it was decided that all messages from Europe destined to the United States would be sent during certain hours of the day from Lyons, and, if possible, from Rome and Carnarvon. Messages from the United States destined for Europe were to be transmitted from New Brunswick, Sayville, Tuckerton, and as soon as possible from Annapolis during the remaining hours of the day. In the beginning this system was capable of handling only a comparatively few important messages. Later, when it became evident that the Germans were making some attempt to cut cables off the coast of the United States, it was decided to erect another high-power station in France. In the meantime, improvements were being made at Lyons and Rome. The key was in the Navy Department for transmission from Sayville, Tuckerton, New Brunswick, and Annapolis.

New improvements in organization and operating methods were made both in the United States and in Europe, resulting in a centralized control of United States high-power radio stations from the Navy Department. A receiving station was constructed at Bar Harbor, Me., which proved to be one of the best receiving stations in the United States. The receiving stations at Chatham and Belmar were not used, as they were not necessary. The power of the radio stations at Tuckerton, Sayville, and New Brunswick had been increased. At the time the armistice was signed the United States system was capable of handling several thousand words per hour, and the whole transoceanic system was able to transmit and receive messages simultaneously without fear of intentional interference from Germany's high-power radio stations. Also, just before the armistice was signed, experiments in high-speed transmitting and photographic reception had begun. Had it been necessary the trans-Atlantic radio service would have been capable of handling all of the Government traffic between Europe and the United States.

When the United States entered the war it was noticed that the Central Powers were conducting a comprehensive scheme of propaganda by wireless. Counteracting this were the systems operating from France and England. The United States had no means of distributing American news throughout the world. Therefore it was decided to use the transoceanic system of the Navy to distribute news of a reliable nature from the United States. The trans-Atlantic stations transmitted this press news to Europe and South America. Naval vessels in South America received the press and distributed it to the local papers in those countries. The European news was distributed by Admiral Sims's headquarters and redistributed to the various capitals of Europe, including points in Russia. The Central American news was broadcasted from the Navy's high-power station in the Canal Zone and was received in the northern part of South America and Central America and Mexico. News was distributed to the Philippines, Japan, China, and Siberia through the Navy's trans-Pacific high-power stations. These reports were received in the Philippines, Shanghai, Vladivostok, and Japan and distributed to the local papers in those countries.

During the war it was found exceedingly difficult to locate persons in the United States who were using radio apparatus unlawfully. Also, when the German submarines began operations off the United States in June, 1918, it was found that although the radio signals of the submarines were intercepted by naval radio stations along the coast, there were no efficient devices by which the exact location of the submarines could be ascertained from their radio signals.

It was found that enemy submarines used their radio apparatus promiscuously, and that they operated in pairs in order that they could fix the position of their prey by means of bearings. Such procedure necessitated the use of radio.

In order to counteract the foregoing situation, the Navy developed a comprehensive system of radio compasses, by means of which the bearing or direction of the enemy's signals could be obtained. Also all signals were copied, so that every time a message was sent the Navy could trace it. Shortly afterwards it was noted that the submarines did not use their radio, and it is believed that the Navy's shore radio compass system robbed the enemy of a vital weapon, as the radio compass not only made it dangerous for the enemy to use their radio for communication purposes between one another but also prevented them from using it for sending decoy distress messages.

Later the Secretary of the Navy, "in a plan to hasten the progress of troopships," authorized the construction of 15 additional radio-compass stations, making a total of 34 on the Atlantic and Gulf coasts. These radio-compass stations were at harbor entrances and enabled ships at sea to enter port without consequent delays due to thick weather and fog. This was a very important item in the war, as every minute counted in a ship's voyage.

After the armistice was signed, the Secretary authorized the construction of 24 more radio-compass stations which made a grand total of 58 in the United States, and which are to be used as aids to navigation during time of peace.

The technical bureaus of the Navy Department kept pace with the operating departments in their advance in the art of radio communication, and in cooperation with the radio engineers of the country accomplished some remarkable developments in radio during the war.

Efficiency in high-power transmission was increased from 30 to 90 per cent. Not only was greater efficiency arrived at with lower cost, but the power of transmission was increased. For example, the radio station at Bordeaux,

France, which is being constructed under the auspices of the Navy Department, has an input of 1,000 kilowatts. Its range is estimated to be 12,000 miles. It has eight 820-foot towers.

There was an increase in speed of transmission from about 30 words a minute to 100 words a minute in actual practice, and to about 300 words a minute in pre-arranged tests. One of the difficulties in high-power stations was the sleet on the antennæ. Methods have been arrived at by which sleet is now prevented from accumulating on the wires of the antennæ.

The valve has been developed from a nonoscillating detector to an oscillating transmitter. It is possible to receive radio signals by the boat method and to transmit signals from the valves at comparatively long distances. The valve is used also in the transmission of speech and is very efficient for this purpose.

Another feature of valve transmission is that it permits of very sharp tuning, which in turn permits simultaneous transmissions from a great many stations. It is believed that it will be developed in the future to such an extent that it will replace most of the existing low-power transmitters.

Another feature of the valve is that its life has increased from 5 hours to over 5,000 hours, which is a very important item in the expense.

Great improvements have been made in receiving apparatus in that they are more selective, and directive receiving has increased in efficiency from 0 to 75 per cent. The old type of overhead antenna is being rapidly replaced by the use of balanced loops and underground wires, radio changers, and low horizontal wiring.

It is now possible to receive signals on submarines while submerged at depths of 20 feet from shore stations, aircraft overhead, and ships afloat. This system was used to advantage in directing our submarines off our coast when they were hunting for enemy submarines.

Another improvement has been made in the radio compass, which was used at first for detecting the positions of enemy submarines, but is now developed into an aid for navigation. With properly trained personnel the Navy is now able to give ships their positions without any large error. This will be a great boon to our merchant marine, because it eliminates the delays caused by fog and thick weather, besides making navigation generally more safe along the coast.

To illustrate how a naval communication district acts, I should like to take, as an example, the Third Naval District, which extends from Rhode Island to Barnegat Inlet, and in which there are eight coastal radio stations which are located as follows: Montauk, L. I.; Fire Island, L. I.; Rockaway Beach, L. I.; Sea Gate, N. Y.; Bush Terminal, N. Y.; Navy Yard, N. Y.; Mantoloking, N. J.; and New London, Conn. There are also five radio compass stations located as follows: Montauk Point, L. I.; Fire Island, L. I.; Rockaway Beach, L. I.; Sandy Hook, N. J.; and Mantoloking, N. J. These radio and compass stations are all controlled from one Central Control Station, located at No. 44 Whitehall Street, New York City, at which place are also the offices of the district communication superintendent. Direct wires from each of these stations lead into the Central Control Station, and by means of a plug-board arrangement similar in type to that used by the telephone companies, any one of these stations may be used as a transmitter by the operator on watch at the control station.

The control station is divided into a number of booths which are magnetically shielded from one another and which contain receiving apparatus of the most up-to-date type. Each booth is given a wave length, which operator on watch must guard. There is no transmitting apparatus at this control station, all transmitting being done by means of distant control through one of the other stations mentioned above. Therefore the operator on watch at 600 meters receives a call and desires to answer, he promptly plugs in on a wire to any station he may decide to use and transmits via that station. He is listening all the time to what he is sending and should he hear a distress signal, he could instantly stop and give his attention to the distress call.

A chief electrician (radio) is on duty at this control station as supervisor of traffic. On his desk he has a receiver which enables him to listen in and keep check on the traffic being handled on the various wave lengths, and, from time to time, gives orders to the various operators and stations so as to avoid interferences. Such a system of supervision was found necessary in order to overcome some of the difficulties brought about by the large increase in radio traffic about the port of New York. The excellent manner in which this

system functions locally about the port of New York is another illustration of the necessity of radio supervision by one central controlling agency.

All the stations in the Third Naval District, however, are not at all times controlled from the Central Control Station. If traffic warrants it, some outlying station, such as Montauk or Fire Island, is given orders by the supervising electrician to handle traffic independently. At such time, the outlying stations are practically acting as agents for the control station.

The great advantage, besides regulating radio traffic and cutting down the amount of interference, that should any of the stations in the district, or the control station, hear a distress call, or any other emergency arises, the control station can immediately notify all stations to stop sending, which will leave the air clear so that the emergency may be taken care of. The ability to stop all stations in the district instantly is an absolute necessity in time of war and proved itself of much value during the time the German submarines were active along the American coast.

The radio compass stations are controlled in a manner similar to the radio transmitting stations in the third naval district. Each compass station in the district is connected with the compass control station at No. 44 Whitehall Street, New York City (which is in the same room with the radio control station), by means of direct wires.

I want to call attention to the flexibility of the naval communication service and cite as an instance the flight of the *NC-4*. A message was transmitted from the Navy Department to the plane during its trans-Atlantic flight, a reply was received from the plane, and this reply was transmitted to London, Paris, San Francisco, and the Canal Zone, and an acknowledgment received from those stations, all within three minutes of the time of beginning the first transmission to the plane from the Navy Department. Of course, everyone was very much interested in the flight and the stations were all very keen to give the very best service, but this remarkably rapid operation was even a little better than we had anticipated.

During the peace conference the naval communication service handled all of the radio communication for the American delegation. During the past summer, at the request of the American Relief Association, the commander of our naval forces in European waters put the naval communication service personnel on land lines, handling the Relief Association messages throughout certain countries in Europe, and they are now handling that service and will continue to handle it until peace is finally proclaimed. This involves a complete communication system in central Europe, and gives the Navy, as well as the American Relief Association, a communication system between its London headquarters and Paris, Germany, Poland, Belgium, Italy, Austria-Hungary, and Turkey. (See attached chart for details of naval communication service circuits in Europe.)

When the Radio Service was established in 1913, through an agreement among the various Government departments interested the Naval Communication Service was designated to handle the international radio accounting between foreign shore stations and United States merchant vessels.

The Communication Office of the Navy Department has handled during the last year the following messages:

Sent to Europe by Navy Department.....	16, 910
Sent to Europe by other departments.....	3, 645
Sent to home waters by Operations.....	22, 870
Sent to home waters by bureaus and other departments.....	351, 516

Total	394, 941
-------------	----------

Received from Europe by Navy Department for Navy.....	23, 084
Received from Europe by Navy Department for other departments.....	3, 893
Received from home waters to Operations.....	49, 950
Received from home waters to bureaus and other departments.....	717, 313

Total	794, 190
-------------	----------

Grand total.....	1, 189, 131
------------------	-------------

Grand total number words at 60 words per dispatch.....	71, 347, 860
--	--------------

The foregoing total was handled as follows:

By coastal radio.....	1,621,542
By high-power radio, trans-Atlantic and continental.....	16,215,423
By leased wire, Western Union and Postal.....	53,500,895

The above figures are exact, except the bureau dispatches, which are approximate and are based on the daily ratio of bureau dispatches to others during the last five months since an accurate record has been kept.

You will note that there were approximately 71,350,000 words handled by the Naval Communication Service. The high-power radio handled approximately 16,000,000. The leased wires handled approximately 53,000,000, and the coastal stations handled about 1,500,000.

During the period of demobilization a very large commercial business was done with returning transports, some of the larger transports handling 1,500 messages in a single month, the men wishing to send messages to their friends at home. In order to encourage this use of radio by returning troops, free service was accorded military personnel and civilian employees of the Government in so far as the ship's sending charges were concerned. Of course, this served to increase the traffic and afforded the men a chance to communicate with their families.

During the period of the war, and until April 1, 1919, practically no revenue was obtained from traffic with foreign ships. This was due to the fact that up until that time no personal messages were allowed, and allied countries, with one exception, had agreed to handle messages for allied ships free of cost as regards shore-station tolls. Prewar charges were placed in effect for United States shore stations on April 1, 1919, and foreign ships were charged regular shore-station tolls.

Owing to the congestion of the Pacific cables the Naval Communication Service reopened the trans-Pacific circuit to Japan and the Philippines on December 19, 1918. This service, so far as Japan was concerned, took the place of the service inaugurated by the Marconi Co., about three months previous to the outbreak of the war, the Navy carrying out the agreement as to tolls between San Francisco, Pearl Harbor, and Japan. Owing to the large volume of Government business this traffic was restricted to full-rate business only.

In November, 1918, the telegraph and telephone division was in charge of a lieutenant commander, with five officers, twelve chief petty officers, and an enlisted personnel of about 130. The telegraph system of the Navy Department at that time included wires from Galveston, Tex., to Bar Harbor, Me. The leased telephone wires of the Navy Department extended from Norfolk, Va., to Portsmouth, N. H., there being seven private telephones from the department to New York alone. The telegraph office of the Navy Department was handling 4,000 messages a day, and the Navy telephone exchange was handling 18,000 telephone calls per day.

At the time of the armistice, the Daily Shipping Bulletin, referred to previously, was being printed on a hand press, and about 300 copies a day were being distributed. It was very roughly made up and had not assumed any permanent form. The personnel consisted of three officers and about 100 enlisted men.

By July 1, 1919, the circulation of the Daily Shipping Bulletin had grown to nearly 2,000 copies a day. It was being printed on a power press and had assumed a standard form. Of its total circulation, nearly 1,400 were commercial firms, such as shipping companies, marine underwriters, ship brokers, exporters and importers, press associations, etc. The bulletin contained the name of 12,500 ships with news of their latest movements and the record of nationality, register, tonnage, and cargo. The popular demand for the bulletin is growing daily and its success as a Government activity is assured.

During the war the censorship of all cables was controlled from the director naval communications office through the following branch offices:

	Personnel.	
	Nov. 11, 1918.	June 30, 1919.
Brasil.....	9	
Guam.....	5	
Guantanamo Bay.....	3	
Galveston.....	17	
Honolulu.....	17	
Cape Haitien.....	1	
Key West.....	9	
Lisbon.....	1	
New Orleans.....	12	
New York.....	780	78
Paris.....	1	
Ponce.....	3	
Panama.....	8	
San Antonio.....	7	
San Domingo and Puerta Plata.....	5	
San Diego.....	1	
San Juan.....	9	
San Francisco.....	151	
St. Thomas.....	3	
Seattle.....	5	
London.....	1	
Chief cable censor.....	103	4

On April 18, 1919, by Executive order, the censorship on all cables was removed from all messages except those addressed to or from German territory. This act greatly reduced the activities of the section, and all branch offices except Washington and New York were closed. On July 23, 1919, all censorship of cables was removed and this section rapidly completed its most important duties.

The naval radio stations placed in commission since December 31, 1913, by years, are shown in the following list:

In 1914: Port Royal, S. C., and Cordova, Alaska.

In 1915: Indian Head, Md.; Darien, Canal Zone; Tutuila, Samoa, and Managua, Nicaragua.

In 1916: Point Isabel, Tex.; San Diego-Chollas Heights, Calif.; Pearl Harbor, Hawaii.

In 1917: Navassa Island; St. Thomas, V. I.; St. Croix, V. L.; Buffalo, N. Y.; Alpena, Mich.; Marshfield, Oreg.; Vladivostok, Siberia.

In 1919: Sea Wall, Me.; Chatham, Mass. (Air); Melville, R. I.; Cayey, Porto Rico; Port au Prince, Haiti; Cape Henlopen, Del.; Blackistone Island, Md.; Dahlgren, Va.; Wilmington, N. C.; Detroit, Mich.; Puerto Obaldia, R. P.; La Palma, R. P.; Cape Mala, R. P.; Coco Solo (Air), Canal Zone; Wailupe, Oahu, Hawaii.

In 1920: San Diego, North Island (Air), Calif.; San Pedro, Calif.; Westport, Wash.; Los Banos, Philippine Islands.

The following stations were acquired by purchase from the Marconi and Federal companies during 1918:

Boston (Filene), Mass.; Siasconset, Mass.; Sea Gate, N. Y.; Cape May, N. J.; Baltimore, Md.; Virginia Beach, Va.; Cape Hatteras, N. C.; Savannah, Ga.; Jacksonville, Fla.; Miami, Fla.; Tampa, Fla.; Galveston, Tex.; Port Arthur, Tex.; Mobile, Ala.; Chicago, Ill.; Frankfort, Ill.; Milwaukee, Wis.; Calumet, Mich.; Duluth, Minn.; Ludington, Mich.; Manitowoc, Mich.; Cleveland, Ohio; Mackinac Island, Mich.; Manistique, Mich.; Grand Haven, Mich.; Inglewood, Calif.; Avalon, Calif.; San Francisco-Hillcrest, Calif.; San Francisco Beach, Calif.; Seattle, Wash.; Astoria, Oreg.; Ketchikan, Alaska; Juneau, Alaska; Heela, Hawaii, Hawaiian Territory; Sayville, L. I., N. Y. The last named is an ex-German station.

The following data is submitted in connection with naval radio compass stations:

Cross Island, Me., completed December, 1918.

Bar Harbor, Me., completed December, 1918.

Samiscope Island, Me., completed December, 1918.

Appledore Island, Me., completed December, 1918.

Gloucester, Mass., completed January, 1919.

Deer Island, Mass., completed January, 1919.

Fourth Cliff, Mass., under construction.
 North Truro, Mass., completed January, 1919.
 Chatham, Mass., under construction.
 Surfside, Nantucket, Mass., completed October, 1918.
 Princes Neck, R. I., completed October, 1918.
 Watch Hill, R. I., completed October, 1918.
 Montauk Point, L. I., N. Y., completed March, 1919.
 Fire Island, N. Y., completed January, 1919.
 Rockaway Beach, N. Y., completed January, 1919.
 Sandy Hook, N. J., completed January, 1919.
 Mantoloking, N. J., completed January, 1919.
 Cape May, N. J., completed December, 1918.
 Cape Henlopen, Del., completed December, 1918.
 Bethany Beach, Del., completed December, 1918.
 Hog Island, Pa., completed December, 1918.
 Smith Island, Va., under construction.
 Cape Henry, Va., completed February, 1919.
 Cape Hatteras, N. C., completed February, 1919.
 Cape Lookout, N. C., completed February, 1919.
 North Island, S. C., completed March, 1919.
 Morris Island, S. C., completed April, 1919.
 Jupiter Inlet, Fla., under construction.
 Pass a'Loutre, La., completed April, 1920.
 Burrwood, La., completed April, 1920.
 Grande Island, La., completed April, 1920.
 Smith Island, Wash., under construction.
 Cattle Point, San Juan Island, Wash., under construction.
 New Dungeness, Wash., under construction.
 Slip Point, Wash., under construction.
 Tatoosh Yard, Wash., under construction.
 Westport, Grays Harbor, Wash., under construction.
 Fort Stevens, Oreg., completed April, 1920.
 Empire, Oreg., completed April, 1920.
 Eureka, Calif., under construction.
 Point Reyes, Calif., completed April, 1920.
 Farallon Island, Calif., completed April, 1920.
 Bird Island, Calif., under construction.
 Point Montara, Calif., under construction.
 Point Arguello, Calif., under construction.
 Point Hueneme, Calif., under construction.
 Point Fermin, Calif., under construction.
 Avalon, Santa Catalina Island, Calif., completed April, 1920.
 Point Loma, Calif., under construction.
 Imperial Beach, Calif., completed April, 1920.

NOTE.—Seventeen stations are now in commission. Eighteen stations are out of commission due to lack of personnel. Fifteen stations are under construction.

The following list shows the number of light vessel radio stations operated by the Navy:

Light Vessel No.—		Light Vessel No.—	
Handkerchief Shoals	3	Fire Island	68
Stone Horse Shoals	5	Ambrose	87
Brenton Reef	39	Scotland	11
Vineyard Sound	41	Cornfield Point	48
Pollock Rip	47	Fenwick Shoals	52
Pollock Rip Slue	73	Five Fathom Bank	79
Relief	86	Overfalls	69
South Shoals	90	North East End	44
Great Round Shoals	96	Tail of Horseshoe	46
Nantucket Shoals	85	Relief	49
Relief	4	Diamond Shoals	72
Hen and Chickens	42	Cape Lookout	80
Boston	54	Winter Quarter Shoals	91
Portland	74	Cape Charles	101
Cross Rip Slue	20	Relief	53

	Light Vessel No.—		Light Vessel No.—
Brunswick	84	Umatilla Reef	67
Frying Pan Shoals	94	Relief	78
Martons Industry	1	Relief	16
Charleston	34	Ram Island Reef	23
Heald Bank	81	Columbia River	88
South West Pass	102	Relief	92
Swift Sure Bank	93		

The following is a summary of the naval radio stations, both ship and shore: 585 naval ship stations, 119 coastal shore stations, 29 radio compass stations, 48 light vessel stations, 11 high-power stations.

The location of the stations comprising the Navy's chain of high-power stations is indicated below:

Cavite, Philippine Islands; Guam, Marianas; Pearl Harbor, Hawaii; Heeia, Hawaii; San Francisco, Calif.; San Diego, Calif.; Sayville, L. I., N. Y.; Annapolis, Md.; Arlington, Va.; Darien, Canal Zone; Cayey, P. R.

In order to provide facilities for communication between the Atlantic, Pacific, and Asiatic Fleets and the Department, it was necessary to establish radio stations in all our outlying possessions and territory under control of the United States, in the Philippines, Tutuila, Guam, Hawaiian Islands, Virgin Islands, Haiti, Porto Rico, Cuba, and Alaska, as well as along our Atlantic, Pacific, and Gulf coasts and along the Great Lakes.

The cost of the 11 naval high-power stations was approximately \$4,000,000, which figure includes the cost of the Annapolis station which was established as a war emergency when it was feared the cables would be cut, but does not include the cost of the Sayville, South San Francisco, and Heeia stations, which were already established and acquired by the Navy during the war.

The present material view of the 792 naval stations, including equipment on naval vessels, light vessels, and the properties comprising the shore radio stations is approximately \$20,000,000.

The cost of the radio service, including experimental work, improvements, new construction, and upkeep of ship and shore stations, is approximately \$2,500,000 annually.

This expenditure is offset to a great extent by the tolls received from commercial messages handled by the naval stations, which receipts are turned into the Treasury of the United States as "miscellaneous receipts."

The Philippine Islands (Cavite) and Marianas (Guam) stations communicate directly across the Pacific with the Hawaiian Islands stations (Pearl Harbor and Heeia), which latter stations communicate directly with the California stations (South San Francisco and San Diego), which latter stations communicate directly with Washington. The Canal Zone (Darien) and West Indies (Cayey) stations communicate directly with Washington. The Annapolis and Sayville stations communicate directly with European stations in England, France, Italy, and Germany, and such other stations as may be desirable. The Radio, Virginia (Arlington) station communicates with all points in the United States as desired, clearing the traffic which the semihigh-power stations, one in each naval district, collect from the coastal stations and ships at sea.

Vessels of the Navy are equipped with radio equipment ranging in power from 30 kilowatts, on capital ships to $\frac{1}{2}$ kilowatt on the submarine chasers and as a result of this, taken in conjunction with the Navy's chain of high power, medium power, and coastal stations, the department is enabled to maintain continuous communication with the three fleets and their auxiliaries in all waters independently of any other systems of communication.

In connection with previous remarks concerning the difficulty encountered by the Navy in its endeavors to secure the most efficient radio equipment of the latest type, a case in point is mentioned.

Prior to the year 1912 the radio equipment used in the naval service consisted of spark or intermittent wave transmitters similar to the equipment developed by Marconi. Serious difficulty was encountered in the Navy's endeavors to do long-distance work with this type of equipment and it was not considered suitable for installation in any of the stations which were to comprise the Navy's chain of high-power stations, the establishment of which was then being considered. A new type of equipment, known as the Poulsen arc or continuous wave transmitter, was on the market, this system having been developed in Denmark, the patent rights in the United States having been acquired by the Federal Telegraph Co. of San Francisco. Notwithstanding the opposition en-

countered from the manufacturers of spark equipment, which was only to be expected, the Navy arranged with the Federal Telegraph Co. to install one of their medium-power arc transmitters in the Arlington station, with the result that reliable daylight communications were had between Arlington and the Federal Co.'s South San Francisco station.

This clearly demonstrates that the arc equipment was vastly superior to the spark type of equipment and a contract was given the Federal Co. for a 100-kilowatt arc transmitter for the new Darien (Canal Zone) station and the other stations comprising the Navy's chain of high-power stations were subsequently established and equipped with arc sets, as were also the medium-power stations located one in each naval district.

As a result, reliable communication facilities have been provided whereby the Navy Department can keep in constant touch with all units of the fleets and reliable means of communication with our outlying possessions are available to the Government, independently of the cable systems.

An improvement on the arc transmitter has very recently appeared on the market, namely, the Alexanderson alternator, manufactured by the General Electric Co. Two of these high-frequency alternators were installed in the New Brunswick (Marconi) station after the station was taken over by the Navy for war purposes, and this station was subsequently used to communicate with England, France, and Italy during the war, President Wilson's reply to the German Government's request for an armistice having been transmitted from this station to the radio station at Nauen, Germany, direct.

In addition to radiotelegraph communications sent from the New Brunswick station to foreign countries during the war, the alternators installed in this station were utilized for radiotelephone communications with the U. S. S. *George Washington* when that vessel was transporting President Wilson to and from France.

Great strides were made in the advancement of the radio art after the United States entered the war, some of the outstanding features being indicated below:

The design and development of the radio compass for use as an aid to navigation, detection of enemy craft, and stations.

The development of arc transmitters of 1,000-kilowatt capacity for the new high-power stations projected to replace the cables if necessary; 500 kilowatts having previously been considered the limit in power of these sets. The development of this equipment was effected in conjunction with the Federal Telegraph Co. Arrangements were practically completed to establish adequate facilities for communications with our allies in the event of all the cables being cut by German submarines, when the armistice was signed. This project was then abandoned. The establishment of a 1,000-kilowatt station at Croix d'Hins, France, had been previously undertaken by the Navy, however, and this station is now nearing completion. The French Government will pay all expenses incident to the establishment of this station.

DESIGN AND DEVELOPMENT OF SUITABLE RADIOEQUIPMENT FOR AIRCRAFT.

As it was essential that all aircraft should be equipped with radio, the Navy undertook the design and developed suitable radiotelegraph, radiotelephone, and radiocompass equipment. Great assistance was given by the various radio commercial companies in this connection, particularly by the Western Electric Co. in connection with radiotelephones. The early results obtained were not encouraging, as the distance for which communication could be carried on averaged only about 25 miles.

The equipment was gradually developed, however, so that communications both radiotelegraph and radiotelephone could be carried on between planes and with the ground for several hundred miles. The development of the radio compass for aircraft was of the greatest importance, as it enabled the planes to navigate by this means when no other method could be used. The Navy seaplane NC-4 in its flight across the Atlantic was in continuous communication with ship and shore stations during the entire journey.

Many other notable advances in the radio art were accomplished during the war, including the development of reception on submarines, reception of radio signals on shore with antennae buried in the ground, and general improvement in the type of transmitting and receiving equipment in general.

In addition to the heavy demands made on the Naval Communication Service by the entrance of the United States into the war, including the increased

number of vessels of the fleets, including new destroyers, submarine chasers, etc., and the taking over of all the commercial radio companies' shore stations, it was also necessary to make all provisions for the design, purchase, installation, and maintenance of radio equipments on all vessels of the United States Shipping Board, as that organization was not prepared to handle the work owing to its highly technical nature. The Navy has installed radio equipment on approximately 1,500 Shipping Board vessels to date.

After the United States entered the war the commercial radio companies' stations were all turned over to the Navy in accordance with the act of Congress and the President's proclamation, and it was necessary to assume the entire burden of the maintenance and operation of these stations. All of the various branches of the Government—Coast Guard, Lighthouse Service, and Shipping Board—immediately turned to the Navy for their ship radio service, and these responsibilities were met and successfully carried on during the war, without complaint of insufficient or inadequate service from any quarter.

The Naval Communication Service is in a position to meet all the demands that are likely to be made upon it and is prepared to carry on communications with all of our outlying possessions as well as with vessels of the fleets and the American merchant marine and other vessels at sea. It is confidently believed that the Navy's chain of high-power stations can handle all traffic with our outlying possessions that is now handled by the cables, the majority of which latter are foreign owned, and it is believed that these facilities will have a tendency not only to prevent an increase in these rates but to force a reduction thereof.

W. H. BULLARD.

Secretary DANIELS. Mr. Chairman, bringing nearly half a million new men into the Navy during the World War required the best sanitary methods and the best medical skill and care. In no duty was the Navy better prepared than in this important duty. The able Surgeon General had looked ahead, and the Navy lacked nothing that wise foresight, ability, and diligence could provide for the health of the naval personnel.

The story of how the Medical Department measured up to its high responsibility is given in a statement by Admiral William C. Braisted, Surgeon General of the Navy.

I present that statement for the record.

(The statement referred to is here printed in the record in full, as follows:)

PREPAREDNESS OF THE MEDICAL DEPARTMENT OF THE NAVY FOR WAR AND MEDICAL DEPARTMENT ACTIVITIES DURING THE WORLD WAR.

[By Rear Admiral William C. Braisted, Medical Corps, United States Navy, Surgeon General of the Navy.]

The work of the Medical Department of the Navy in the World War has so often been the subject of favorable comment by experts and by others who were brought intimately into a position to observe its activities that it would seem permissible at this time not to undertake to demonstrate that the department was prepared for war, but rather to review briefly the story of the constant thought which was and must be given in time of peace in the everyday affairs of this branch of the naval service to the possibility of great and sudden emergency. Such a review will serve a useful purpose if it leads to a more general realization of the vast amount of work, much of it requiring years of patient labor and continual training of personnel that is necessary if the organization of the Medical Department is to withstand without strain and disastrous delay the initial violent efforts to mobilize the Navy for immediate action. The dangers of disease and the likelihood of great loss of life are unavoidable concomitants of a sudden outbreak of war.

Early in 1918 a careful investigation of the conduct of the Navy in war was made by a subcommittee of the House Committee on Naval Affairs. The report of that committee reads in part as follows:

"The first battle of the war, that against disease, was fought and won by the Medical Department of the Navy. After diplomatic relations with Germany

were broken in February, 1917, recruits, we find, streamed into the service in increasing numbers, and in April there was grave danger that the overwhelming influx of volunteers would overtax all training stations and receiving-ship facilities and bring disaster to the Navy at the very beginning of the war by the introduction and spread of epidemic diseases which unfortunately were widely prevalent throughout the country at that time. In spite of all the difficulties in the way of rapid expansion and the sudden necessity for the training of new medical personnel and Hospital Corps men, the health of the Navy has been even better than in peace times.

"The Medical Department facilities have undergone tremendous development everywhere. The excellent and finely equipped base hospitals, which were built before the war, have been greatly expanded with a speed which could not have been attained if the organization of the Medical Department as a whole had not been carefully thought out long before war came and plans perfected for the immediate enlargement of base hospitals and the construction of emergency hospitals of the finest type wherever necessary. The total bed capacity of naval hospitals was thus increased in period of a few months from 3,800 to more than 15,000 beds. The mothers of the country can rest assured that in these hospitals their sons will receive excellent care and nursing and the most skilled treatment that modern medical and surgical knowledge permits. The Navy Nurse Corps, comprising women of the highest type in the nursing profession has been increased to more than 700.

"On board ship and at naval stations the health of the men is protected by all the safeguards known to preventive medicine. The Hospital Corps, upon which falls exclusively the nursing of the sick and wounded outside of hospitals, has been increased from 1,500 to nearly 9,000. Hospital Corps training schools have been established in connection with the training stations at San Francisco, Great Lakes, Newport (R. I.), and Hampton Roads. In these schools young men of character and aptitude are intensively trained for their duties at sea.

"Foreseeing that the hospital ship now under construction would not be completed in time to meet the war needs of the service, two large liners were secured and converted into hospital ships to supplement the work of the hospital ship *Solace*.

"Admiral Braisted arranged that the transports operated by the Navy should have ample Medical Department facilities and necessary equipment, and so far as naval facilities exist, has assumed responsibility for the medical and surgical care of all Army sick and wounded who may be transported home on naval vessels from Europe.

"For the care of our naval forces in England, France, and European waters three base hospitals are already in operation abroad.

"In expanding the Medical Department to meet the present and future needs of the Navy, we were glad to find that the needs of the increasing numbers of industrial workers and other civil employees in the large manufacturing plants and navy yards had not been overlooked. The peace-time humanitarian work is also being continued in connection with Haiti, Santo Domingo, Virgin Islands, Samoa, and Guam, involving a population of over 2,000,000 people."

The report concludes with the statement, "It may well be said that the reason for this successful record is to be found in the bureau's preparedness, due to foresight and cooperation."

In the early months of the war when the medical members of the Council of National Defense were studying our organization and work they repeatedly expressed admiration of the smoothness of operation and the celerity with which large undertakings were accomplished. In fact they and others competent to judge were of opinion that there was no finer medico-military organization in the world at the outbreak of war than that of the United States Navy.

For a true perspective of Medical Department preparedness it is necessary to go back several years. It is our business at all times to prepare for war. Long before events suggested the probability of war among European nations, preparations for war—any war—were going on steadily. Owing to Surg. Gen. Rixey's foresight I was sent to Japan during the Russo-Japanese War as medical observer to gather information that might be utilized in our own preparations. Much was learned during my year of study in Japan and the knowledge gained proved to be of the greatest value. In the years previous to the World War the vivid preconceptions of war and all that war means, formed as a result of that experience, were of the greatest help to me in looking forward to the possibility of war.

Upon returning from Japan I assisted Surg. Gen. Rixey in his vigorous policy of enlarging, extending, and modernizing our chain of base hospitals. He accomplished a great deal not only in this direction but in the improvement of conditions relating to personnel as well, and from this time forward the Medical Department has been engaged in unremitting efforts to prepare for any eventuality in so far as the public interests and the judgment of the people permitted.

The subject of Medical Department preparedness for war may be considered under the following headings:

1. Organization.
2. Personnel.
3. Hospitals, hospital ships, and other provisions for the care of the sick and wounded.
4. Material equipment: Medical and surgical supplies, medical and surgical equipment.
5. Preventive medicine and sanitation.
6. Finances.

The Medical Department must be organized in time of peace in such a way that rapid expansion can take place without any change in the scheme of organization, without confusion, and without retarding or interfering with routine work, because with mobilization for war there comes a tremendous and sudden increase in the work of the Medical Department, both in connection with the induction of officer and enlisted material of all ratings into service and on account of an increase in sickness inevitable with an untrained and unseasoned personnel undergoing intensive training. At the same time the new Medical Department personnel must be trained rapidly. Provision must be made for the care of greatly augmented naval forces in the way of enlargement of base hospital facilities, and plans must be laid in advance to meet all possible contingencies which may arise from the special character of the war.

For several years before this war the most careful consideration was given to matters of organization. Shortages of Medical Department personnel in relation to the growing peace-time Navy were pointed out and appropriate legislation was recommended. The difficulty of affecting rapid expansion of the Medical Corps and of the Hospital Corps, under the existing conditions of many years standing, was clearly recognized.

The Hospital Corps of the Navy is peculiar to the United States Navy. It was established as such in 1898 and reorganized in 1906. The Nurse Corps, composed of trained women, was established in 1908 as a further step toward preparedness and assurance of the best possible care of the sick and wounded in accordance with modern standards of nursing. The Medical Reserve Corps was created by act of Congress, August 22, 1912, with a view to paving the way for the rapid mobilization of additional medical officers for active service in case of war.

Before the war complete reorganization of Medical Department personnel was effected. The distribution of medical officers on a fixed basis took place with proper distribution in grade and rank so that when war came it was only necessary to take in the additional personnel as rapidly as required to keep pace with the growing strength of the Navy. Similar changes Hospital Corps were also brought about.

In these particular features of organization more was accomplished in this period reorganization than had been accomplished in the whole previous history of the Medical Department. Secretary Daniels was deeply interested in the legislation necessary to secure these results, realizing not alone what it would mean in peace time but especially in the event of war.

In 1918 the members of the Medical Reserve Corps were listed for mobilization in accordance with their expressed willingness to serve in case of war, and a correspondence course was established for their education in naval matters. A similar course was provided for medical officers of the Naval Militia. Later, when the Medical Reserve Force was created by act of Congress, August 29, 1916, because of the rapidity with which medical officers could in this way be inducted into service and obliged to perform any duty, enrollment in the Reserve Force was carried on in preference to appointment in the Medical Reserve Corps which was subsequently abolished. The physical records of retired medical officers were studied with a view to determining those who might be available for active service, and mobilization points were

designed for those selected. These officers actually reported for duty the day war was declared, in response to telegraphic orders.

In view of the act of Congress of July 1, 1902, which authorized the President to employ the Public Health and Marine Hospital Service in time of threatened or actual war, for service under the Army or Navy, plans were laid to utilize both the personnel and the hospital facilities of the United States Public Health Service in the event of war. The President exercised this authority by Executive order of April 3, 1917.

With a view to preparing in advance for the active cooperation of the American Red Cross, authority to detail medical officers of the Navy to that organization was requested and granted by act of Congress August 29, 1916.

Early in 1916, on the possibility that the United States might enter the World War, an estimate of the situation was made, and charts were drawn up to indicate places where Medical Department personnel would be needed—medical officers, dental surgeons, nurses, and hospital corpsmen. All personnel available at that time, including members of the Medical Reserve Corps, retired officers, and medical officers of the Naval Militia were listed for mobilization.

In October of 1916 the Bureau of Medicine and Surgery made a survey of 144,000 physicians in the United States for the purpose of determining their eligibility for service in the regular Medical Corps. More than 7,000 of these were individually circularized. In addition, the cooperation of medical colleges was sought. While this work did not lead to an immediate increase in the number of applicants, it did familiarize medical men with the service and its needs and resulted in a sufficient number of applications when war came to meet our needs throughout. Early in 1917, with war in prospect, the enrollment of medical and dental officers in the Naval Reserve Force was conducted rapidly by special examiners. The Dental Corps of the Navy was created by act of Congress August 22, 1912. This was an important provision and has done much to aid in promoting physical efficiency of the personnel.

Prior to the declaration of war special parties were sent out to recruit for the Hospital Corps. Hospital Corps schools were established at the naval training station, Newport, R. I. (1914), and at the training station, San Francisco (1915). A third school was established at Great Lakes in January, 1917, and later, when the naval operating base at Hampton Roads, Va., was ready to begin the training of enlisted personnel, a fourth and finely equipped school was located there.

On July 27, 1915, in accordance with Navy Department confidential instructions dated May 28, 1915, following a letter from the General Board to the department, the bureau reported to the department in details its plans for rapid expansion of personnel, enlargement of hospitals, construction of hospitals of the emergency type, utilization of Public Health Service hospitals, arrangements to be made for the care of naval patients in civil hospitals where necessary, as well as data concerning the various civil hospitals and the number of beds available. Specifications were presented for the quick conversion of merchant ships to be used as hospital ships, ambulance ships, or medical transports. The initial requirements for medical and surgical material and Medical Department supplies of all kinds were stated, and probable requirements for the subsequent periods of a war were discussed, together with sources of supply and amounts available with the time necessary for delivery. Detailed plans for the purchase, delivery, and inspection of such supplies were described.

Thereafter, reports of preparations necessary to insure a state of preparedness for war were made quarterly to the department. The preparations of the Medical Department progressed without interruption.

In conjunction with the Bureau of Yards and Docks and the Office of Naval Intelligence plans were prepared for the construction of prison camps, and early in 1916 possible sites, including Government-owned land at Greensborough Neck, Annapolis, Md., were inspected.

In 1916 the war slate for naval districts was revised. Adequate and uniform plans were made for Medical Department organization in each district. A survey of hospitals and other institutions which could be converted into hospitals was completed and the institutions were listed according to naval districts. Naval hospital base units were organized under the auspices of the American Red Cross, which also undertook the development of nursing units and the enrollment of graduate nurses for service in the Navy. Early in 1917 district organization was completed. The Medical Department was divided into two general classes: (a) division of dispensary service (field and local service), and (b) hospital service (central). A senior medical officer was detailed as medical

aid to the commandant of each naval district to supervise all Medical Department activities in the district other than those belonging to the hospital service.

The medical officer in command of the naval hospital was designated as director of hospital service in charge of the naval hospital base, with supervision of the care of all patients transferred to hospital. His duties included arrangements with civil institutions for the care of Navy patients when necessary; general supervision over their care and treatment under such circumstances; and development of naval base hospital facilities to meet growing needs. His duties required cooperation with the medical aid to the commandant for the complete coordination of all Medical Department activities under close supervision of the Bureau of Medicine and Surgery.

General expansion of naval hospital facilities began in 1909 with the construction of permanent buildings of the finest type at Portsmouth, N. H., Chelsea, Mass., Newport, R. I., and at Puget Sound, together with the enlargement and modernizing of the hospitals at Norfolk, Philadelphia, New York, and Mare Island. The hospitals at Annapolis, Md., and Washington, D. C., were begun in 1904. All of these main hospitals on both coasts were designed to serve as hospital bases, and they were indefinitely planned so that the capacity of each could be increased rapidly by the use of tents for construction of temporary wards should occasion require. Special provision was made late in 1916 for enlargement of the naval hospitals at New York, Norfolk, Mare Island, Puget Sound, and Pearl Harbor.

Plans had been drawn in 1913 for hospitals of an emergency type. Small-scale plans with specifications were completed in June, 1913. These covered buildings comprising a complete hospital unit, to be set up wherever the need for additional hospitals might be demonstrated in the event of war. The plot plans of certain naval hospital reservations were also laid out so that drawings would be available in case of war to show exactly where ward buildings of the emergency type were to be erected.

The emergency hospitals were designed so that each could be increased from a small unit to a total of 5,000 hospital beds if necessary. The plans were very carefully worked up from a study of hospital camp conditions and the probable needs of the Navy. Later developments proved that the original layouts would have been entirely satisfactory. However, when the United States entered the World War it was found that, owing to the shortage of lumber of certain dimensions, material could be obtained more readily and that construction would proceed more rapidly and economically if the plans were modified. The 500-bed camps constructed in the early months of the war were all comprised of one-story buildings, whereas the original plans called for two-story ward buildings. Some improvements were made in the later hospitals, but it may be said of all that no finer hospitals of an emergency type could be expected; and in certain respects, so far as the comfort and treatment of patients is concerned, they were even superior to the best permanent hospitals.

With the exception of the naval hospital at Cape May, N. J., additional construction at New London, Conn., and the unit put up on Wards Island, N. Y., all of the emergency hospitals in the United States were built on Government-owned land.

It is safe to say that when war became imminent the United States had the most magnificent system of naval-base hospitals in the world on a peace-time basis, and to meet war conditions it was only necessary to complete the emergency construction already planned. During the year previous to mobilization a large amount of tentage was procured and distributed among the various hospitals to be stowed away in order that a sufficient number of tents might be available for immediate increase of bed capacity wherever required in case of necessity. Additional hospital beds were also supplied so that, by utilizing extra space in hospital buildings not ordinarily needed for beds, as well as in tents, the bed capacity of these base hospitals could be increased nearly 100 per cent at once. Hospital storerooms were filled with reserve stocks of medical and surgical supplies to meet any demand that might come. Moreover, vessels of the Navy in commission were furnished with greatly increased quantities of medical supplies.

Several years before the war the Bureau of Medicine and Surgery began gradually to accumulate medical and surgical supplies and Medical Department equipment generally, in reserve, the aim being to carry at all times in the principal medical supply depot of Brooklyn, excess stocks equivalent to the de-

mands of one peace-time year. When war broke out in Europe this one year's reserve supply was increased by large purchases without waiting for special appropriations because it was realized that the United States was then largely dependent upon Europe for goods of that character and that much time would be required for their manufacture in this country. The necessity for this large reserve supply was explained to the Naval Committee and specific authorization to proceed with the purchase was secured from Congress in the naval act of August 29, 1916. Through this forethought the Medical Department not only had abundant supplies of medical and surgical stores on hand at the beginning of the war, but there were already in force contracts so drawn that the bureau could purchase without waiting for new bids, and could procure without delay, all stores and equipment needed for the medical outfits of the many additional vessels secured by the Navy Department and converted for naval purposes. In the same manner the new hospitals and the many dispensaries established at numerous training camps and stations were promptly supplied and equipped. Supplies for overseas were invariably furnished in the full quantities requested without delay. Important supplies were duplicated and sometimes triplicated by separate shipments to make good in advance possible losses through the sinking of vessels by the enemy.

In some instances stores and personnel were assembled and held ready waiting word from London. Bureau instructions were to furnish anything requested from London at once without waiting for explanations. In no instance during the war was any ship or station delayed in being placed in active service because of the lack of or delay in the shipment of medical and surgical supplies. London headquarters was authorized to purchase abroad in advance of approval any stores or supplies needed.

Because of these preparations the Medical Department passed quietly from a peace to a war footing on April 6, 1917. A few more clerks and four or five additional officers were taken into the Bureau of Medicine and Surgery but no radical changes in organizations were necessary.

I went to the Secretary and explained the necessity for immediate action with regard to emergency hospital construction. He realized the situation and our plans received instant approval.

By authorizing the technical charge of cost against a small contingent appropriation the Secretary made it possible for me to go ahead with our building operations without awaiting the sanction of Congress, of which we felt assured, but which was not actually given until the passage of the appropriation act of June 15, 1917. By that time we had under way, and some of it nearing completion, millions of dollars worth of hospital buildings in many places. This prompt action before material and labor costs had advanced saved a great deal of money as well as time. By autumn the first chain of new emergency hospitals was ready for use, including those at League Island, Pa., Charleston, S. C., Cape May, N. J., and Pensacola Fla.

At the same time additional temporary wards were ready for occupancy at Portsmouth, N. H.; Newport, R. I.; Norfolk, Va.; and Great Lakes, Ill., so that the first winter of the war was approached with considerable assurance. A little later, additions were made to the base hospitals at Chelsea, Mass.; Philadelphia, Pa.; Mare Island, Calif.; and Puget Sound, Wash. New hospitals were built at Pelham Bay Park, N. Y.; New London, Conn.; Hampton Roads, Va.; and Key West, Fla. United States naval hospitals were also established in Europe.

In brief, the explanation of naval hospital facilities continued steadily throughout the war to keep pace with the growing strength of the Navy, which finally exceeded 600,000 in total personnel by November, 1918. Eventually, naval hospitals were increased in number from 17 to 43, 13 of which were located in Europe, including 5 base hospital units which were organized early in the war.

The hospitals abroad were fitted out with the most modern equipment, most of which, such as operating-room appliances, laundry machinery, sterilizers, etc., was sent from the United States.

By January 1, 1918, the total bed capacity had increased from 3,850 to 15,688. Before the war was over the number of hospital beds available reached a total of more than 19,000. This figure included our hospitals all over the world and 817 beds in three hospital ships.

About the middle of 1917 in view of the increasing activities of our Navy in the war zone and the realization that these would increase as fast as new personnel could be trained, and also on account of the possibility of a fleet

action in which one division at least of the United States fleet would take part with the main British fleet, it was recommended that two base hospitals be established in England or Scotland. This allocation was finally approved abroad and two base hospital units were immediately mobilized. They were held ready pending arrangements for their establishment in the British Isles. The commanding officer of one unit was sent abroad to complete arrangements. After some delay a unit was located in Strathpeffer, Scotland, within easy communication with the main fleet and the bases utilized by the North Sea mining groups. This hospital was magnificently located and splendidly equipped, and it proved to be of great service to the British Navy as well as to our own forces.

Later the second base hospital unit which had been mobilized and was being held in Philadelphia awaiting orders was located at Leith, Scotland, near one of the North Sea bases. The third hospital was located at Queenstown, Ireland, where our main patrol fleet was based. The bureau's first recommendation that these hospitals be established at once was disapproved July 18, 1917, by the commander of United States naval forces operating in European waters on the ground that there would probably not be any demand for these base hospitals, at least not within the year.

After correspondence relative to the contemplated expansion of our forces operating in European waters and the anticipated delay in locating and commissioning them both hospitals were finally placed in operation. Pending the establishment of a base hospital at Queenstown the bureau recommended that a hospital ship be sent to that port in view of the fact that complements amounting to 12,000 men were to base there on ships and ashore. We had additional personnel located in Ireland at aviation and balloon stations. This plan was rejected abroad on the ground that the harbor was too crowded and a hospital ship was not needed.

Early in the war two base hospital units were established at Brest, France, where they did fine work throughout, one of them exclusively for Army patients. The personnel of these units, organized under the auspices of the American Red Cross and enrolled in the Naval Reserve Force under the command of regular medical officers of the Navy, rendered splendid service and are deserving of great credit. Other units were organized, but their services were not required. Twenty-five station hospital units consisting of medical and nursing personnel only were organized in conjunction with the American Red Cross to supplement the personnel at naval-hospital bases. Ten of these were called to duty and served during the war.

With regard to hospital ships, we had the U. S. S. *Solace* in commission at the beginning of the war and we had a new hospital ship under construction at the Philadelphia Navy Yard designed and planned for the purpose of the Bureau of Construction and Surgery. In 1916 the Board of Inspection and Survey having inspected the steamships *Saratoga*, *Havana*, and *Mexico* of the New York & Cuban Steamship Co., these vessels were designated to be assigned to the Medical Department in the event of war, and detailed plans were prepared for their quick conversion for hospital-ship purposes. At the same time all details relating to their complements and equipment were worked out. Plans had been drawn previously, in 1914, for conversion of the *Havana*, *Mexico*, *Saratoga*, and also the *Morro Castle*, a somewhat smaller vessel of the same line. For service in the Pacific Ocean the bureau requested in 1916 that the *Sierra*, *Sonora*, and *Ventura* be designated for conversion into hospital ships. After war was declared the *Havana* and *Saratoga* were converted in accordance with these plans at the New York Navy Yard, the former becoming the U. S. S. *Comfort* and the latter, the U. S. S. *Mcrcy*. These vessels relieved the *Solace* in taking care of the needs of the Atlantic Fleet and they were ready in time to meet other demands. They proved to be excellent hospital ships in so far as merchant ships can be made to serve the purpose.

To go back to the beginning of the war; we had many anxious moments, of course, but on the whole our work went on without confusion. After the declaration of war we received plenty of applications for the Medical Corps, but it was a difficult matter to induct medical officers and train them fast enough to meet the needs of the rapidly expanding Navy. The demand for officers of sufficient experience and training to render them capable of assuming independent duties was very great, especially as the care of the sick at base hospitals and training stations and camps was fast becoming a tremendous undertaking owing to the mounting numbers of unseasoned men undergoing intensive training. These not only brought communicable diseases into the

service with them from civil communities but they were, like all untrained and undisciplined recruits, peculiarly susceptible to disease.

By shortening the course at the United States Naval Medical School, class after class of new medical officers received sufficient preliminary instruction in naval medical matters to fit them for duty at naval hospitals, where with practical experience they were rapidly fitted to perform duty at operating stations and at sea. Advantage was also taken of the offers of various medical schools to provide special courses of instruction. Many men of previous training in the various specialties of medicine rendered splendid service in the Navy along their special lines of work. Some of the most eminent practitioners of the country entered the Naval Reserve Force and served in this way both independently and in connection with hospital units.

The urgent necessity of expanding the Hospital Corps of the Navy to enormous proportions at once presented problems of peculiar perplexity. Fortunately young men of splendid character and excellent ability entered the corps in large numbers, and it was therefore possible to train them much more rapidly than under ordinary circumstances. The establishment of Hospital Corps schools has already been mentioned. In view of the special training required and the diverse duties which must be performed skillfully by these men the enlargement of the corps fast enough to provide for all needs ashore and afloat must be regarded as one of the great accomplishments of the Medical Department.

With war imminent the cooperation of the United States Public Health Service was requested by the Secretary of the Navy and assured by the Secretary of the Treasury. Arrangements were then made to take over the medical personnel attached to Coast Guard vessels and for the use of Public Health Service hospitals in case of need.

Shortly after the beginning of the war, in addition to those serving on board Coast Guard vessels, 13 officers of the Public Health Service, including some of their most experienced and expert members, were detailed to serve in the Navy during the war. One was assigned to each naval district, where he was of the greatest possible assistance to the medical aid to the commandant whom he was able to relieve of a great burden of work in connection with the sanitation of the rapidly growing stations and outlying section bases and in the enforcement of measures for the prevention and control of disease.

This arrangement proved to be a very fortunate one. With the sanitation officer acting as assistant to the medical aid to the commandant, whose time was almost completely consumed with manifold duties relating to the movements of personnel and development of Medical Department activities for the care of the sick, the medical aid was enabled constantly to keep in touch with conditions in all parts of his district. In this way preventive medicine was completely coordinated with curative medicine. It is believed, therefore, that our plan of district medical organization is beyond criticism.

Two of the most expert officers of the Public Health Service, with wide experience in public health organization and sanitation matters of all kinds, were detailed to the Bureau of Medicine and Surgery and assigned to the Division of Sanitation, organized under the direction of a medical officer of the Navy, who was thus enabled to avail himself at all times of the most competent advice and assistance. Intimate relations were quickly established with the Bureau of the Public Health Service and in this way the staff of the bureau, as well as the personnel at the hygiene laboratory, were constantly available for purposes of consultation in addition to the staff of the United States Naval Medical School.

The Bureau of Medicine and Surgery supervised the work of the Medical Department in the field and studied the many problems which constantly arose in connection with the expansion of naval stations and the new ones which were being developed. Particular attention was paid to housing and housing standards for barracks and other habitations, water supplies, environmental conditions, and sanitation matters in general, together with measures for the prevention of communicable diseases. The department, and the service at large as well, was informed each week of health conditions in the Navy. Weekly bulletins were issued containing information and instructions for medical officers, many of whom had not had instruction or experience in civil practice along the lines of preventive medicine and sanitation.

During the first year of the war, when we were almost swamped with our own work, the Secretary sent for me and told me that the Navy would take over the transport service for the Army. For the moment I did not see how

we could do more than we were doing, but the Secretary said we were all in the war together to win, and that I must do everything possible to help Gen. Gorgas.

We went to work on this problem at once and our experience with ship sanitation and Medical Department organization afloat made it comparatively easy to develop plans for safeguarding the health of troops in Navy transports and for the installation of ample medical and surgical facilities for these ships as fast as they were turned over to the Navy for alteration. Never in the history of warfare has there been such a movement of troops so well taken care of, their health protected in every possible manner, every detail of sanitation receiving strict attention and elaborate provisions being made for the care of the sick and wounded with special provisions for the safety of the insane; in fact, the larger vessels were regarded as combined transports and hospital ships. This work was taken over and performed entirely by the Medical Department of the Navy without extra appropriations and without expense to the Army.

Hospital ships were not to be had because it was decided early in the war that military-naval considerations precluded the possibility of assigning ships especially for transportation of the sick and wounded. The Bureau of Medicine and Surgery therefore planned accordingly, well in advance of needs, to meet all contingencies with Navy transport facilities. The provisions made proved ample, not only for the care of the casual sick of troops in transit, but for the actual return of 151,649 Army sick, wounded, and insane; 4,395 Navy, and 3,626 marine, from the expeditionary forces in France alone.

By the time the armistice was signed, plans had been completed for accommodations in Navy transports already in commission, about to be commissioned, and under construction to bring back from Europe 30,000 sick and wounded per month. This figure includes 15,000 bed patients. These were the estimated requirements for an army of 5,000,000 men. Inasmuch as the number of men who reached France did not greatly exceed 2,000,000, the figures show how ample the provisions were. Moreover, these accommodations represented but 80 per cent of the total available, 20 per cent having been reserved for naval personnel.

Another undertaking about which not so much has been heard was the work of the Medical Department in connection with the Naval Overseas Transportation Service, which eventually included more than 350 cargo vessels. The Medical Department organization for this service alone assumed large proportions.

Much might be said of the work of the Medical Department of the Navy in many parts of Europe. Dispensaries and hospitals were established in the eastern Mediterranean district, at Corfu, in Italy, France, Gibraltar, and the Azores to care for the health of United States naval personnel which in all finally approximated 75,000 officers and men, including marine forces numbering more than 28,000. Nothing need be said of the marines except to remind you that in all of their splendid work the Medical Department of the Navy participated. The medical and surgical equipment supplied them was of the highest order and was furnished in advance and in quantities greater than were used.

Among the miscellaneous activities the Bureau of Medicine and Surgery did pioneer work so far as the Navy is concerned in making preparations for defense against poison warfare gases and undertook the instruction of personnel ashore and afloat, including marines detailed for France. A laboratory was established early at the United States Naval Medical School for the study and future study of warfare gases, and a series of bulletins, both confidential and non-confidential, was issued by the bureau for the instruction of naval personnel. One of these bulletins contained drill regulations. Later the excellent Navy gas mask was designed by the Bureau of Construction and Repair in cooperation with the Bureau of Medicine and Surgery.

At the beginning of the war, in connection with the prevention and control of communicable diseases, the bureau enlarged and extended the diagnostic laboratories at naval hospitals and established completely equipped laboratories where required to serve naval district needs. At the naval training stations and larger camps laboratories were provided for an extensive range of scientific work, and a highly trained laboratory personnel was quickly developed. In addition the United States Naval Medical School organized, equipped, and trained the personnel of three mobile laboratory units, which were dispatched re-

peatedly upon short notice to various stations to supplement existing facilities or to provide the laboratory measures necessary for the prompt control of such diseases as diphtheria, cerebrospinal fever, pneumonia, and other carrier-borne diseases. In the early days of the war, as planned in advance, good use was made of the laboratory car of the United States Public Health Service. This was during the initial period of expansion at the naval training station, Great Lakes, Ill.

Special preparations were made to care for the dead. Supplies of caskets were procured in advance of the war and stored in naval hospitals, and during the war all transports were furnished with a sufficient number to meet probable needs. Special instruction in embalming was provided for selected members of the Hospital Corps, and rigid instructions were issued throughout the service relative to the care and disposal of the dead. The bureau has received many appreciative letters from bereaved relatives for the pains taken in this respect. At the present time, due to preparations in advance, we have brought home almost all of our dead from Archangel to Africa, with the exception of marines buried in the zone of the Army in France.

For the first year of the war the percentage of sickness and the admission rates for diseases were lower than for peace-time years. April 1, 1918, the bureau was already planning preventive measures for the control of disease to meet conditions of the next winter and was receiving the full cooperation of other bureaus to that end. The pandemic of influenza in the autumn of 1918 spoiled our record, but in spite of the frightfully severe type of pneumonia which accompanied that disease and the deplorable number of deaths the Navy escaped lightly in comparison with the disastrous consequences of epidemics in many countries, including the United States, when it is considered that a large majority of all persons in the Navy were in the age groups that everywhere showed the highest death rates. The death rate of the Navy from disease for the period of the war was 8.8 per thousand of total strength, the lowest death rate ever recorded for the military or naval forces of the United States in actual war, lasting through all seasons of the year.

In looking back, with the record of this war before us, it is extremely doubtful if our work could have been done very differently or any better if it had to be done over again. Both in making provisions for preparedness and during the war the deep interest of the Secretary was very helpful to me. He never failed to approve of my recommendations when our needs were fully placed before him, and he helped me to put into effect as promptly as possible everything that could be done to make the work of the Medical Department more effective. Indeed, his advice and suggestions were frequently of the greatest assistance.

In conclusion, it should be said that the credit for the successful conduct of the Medical Department of the Navy in the World War belongs in great part to our trained personnel, which must be maintained on an adequate basis if there is to be future preparedness for war in time of peace.

W. C. BEAISTED.

SUMMARY OF MEDICAL DEPARTMENT ACTIVITIES IN PREPARATION FOR AND DURING THE WAR.

Organization features.—Medical Department always preparing for war, long before 1914. Hospital Corps reorganized, 1906. Navy Nurse Corps established, 1908. Medical Reserve Corps created, 1912.

July, 1915, Bureau of Medicine and Surgery reported to Navy Department its detailed plans for war—expansion of personnel, hospital construction, utilization of civil institutions, hospital ships, medical and surgical supplies.

In 1916, reorganization of personnel; Medical and Hospital Corps placed on fixed basis; war slate revised, charts prepared to indicate where personnel would be needed in event of war, and adequate plans for district medical organization made. Arrangements for organization of naval hospital base units under auspices of American Red Cross and for enrollment of nurses. Sites inspected and plans drawn for prison camps in conjunction with Bureau of Yards and Docks and Office of Naval Intelligence.

When war came no radical changes in bureau or Medical Department organization necessary.

Hospitals.—Enlargement and modernizing by finest type of permanent construction of eight existing naval hospitals, 1909. Provision in 1916 for addi-

tional enlargements, New York, Norfolk, Mare Island, Puget Sound, and Pearl Harbor.

Complete plans drawn, 1913, for hospitals of emergency type, each permitting increase from small unit to total capacity of 5,000 beds.

Tentage and additional beds procured and stowed at various naval hospitals in 1916. Hospital storerooms filled with reserve stocks of medical and surgical supplies, and vessels furnished increased quantities. No finer system of naval base hospitals existed anywhere when we entered the war.

Upon declaration of war, with the approval of Secretary, proceeded at once with building operations without awaiting sanction of Congress. First chain of emergency hospitals ready, autumn of 1917. Prompt action saved time and money.

Hospital expansion kept pace with growing needs; total bed capacity increased from 3,850 to 15,689 by January 1, 1918, and more than 19,000 before war ended; figures include hospitals all over the world, and 817 beds in three hospital ships to care for personnel finally exceeding 600,000.

Two base-hospital units early established at Brest, France. Later, United States naval hospitals located at Strathpeffer, Scotland; Leith, Scotland; and Queenstown, Ireland. Other units organized; services not required. Twenty-five station hospital units organized in conjunction with American Red Cross; 10 served.

Naval hospitals and dispensaries established, eastern Mediterranean district, at Corfu in Italy, in various parts of France, at Gibraltar, and in the Azores, to care for naval personnel approximating 75,000 officers and men.

Hospital ships.—In accordance with plans drawn for their conversion in 1916, two merchant ships were altered in 1917 and placed in commission as hospital ships, in addition to the U. S. S. *Solace*. New hospital ships under construction in Philadelphia Navy Yard could not be completed in time for service.

Personnel.—Medical Reserve Force created, 1916; provided for rapid induction of medical officers obligated to perform any duty. October, 1916, Bureau of Medicine and Surgery made survey of 114,000 physicians in the United States to determine eligibility for regular Medical Corps; more than 7,000 individually circularized. With war in prospect, rapid enrollment of medical and dental officers in the Reserve Force.

Medical officers on active duty increased from 353 at outbreak of war to 3,093, as follows: Regular, 829; temporary, 429; reserve, 1,720; retired, 98; acting assistant surgeons, 3; Public Health Service, 16. Dental officers increased from 34 to 485—122 regulars and 363 reserves.

Hospital Corps expanded from 2,000 to 16,564. Hospital Corps schools established: Newport, 1914; San Francisco, 1915; Great Lakes, 1917; Hampton Roads, 1917.

Medical and surgical supplies.—Legislation secured in 1916 to continue accumulation of excess stocks already begun in advance of congressional approval. Abundant supplies on hand when war came. Supplies for overseas furnished in full quantities requested; often duplicated and sometimes triplicated to insure arrival despite submarine menace.

Transports.—Hospital ships not to be had on account of early decision that military and naval desiderations precluded. Therefore plans developed in 1917 for ample medical and surgical facilities which could be installed in transports as fast as they were turned over to the Navy. Larger vessels equipped as combined transports and hospital ships. Troops in transit in Navy transports entirely cared for by Medical Department of the Navy without expense to the Army. That the bureau's provisions proved adequate, shown by actual return of 151,649 Army sick, wounded, and insane—4,395 Navy and 3,625 Marine from France alone—in addition to care of casual sick in transit. Plans completed before the armistice for accommodations in Navy transports commissioned, about to be, and under construction for the return of 30,000 sick and wounded per month, including 15,000 bed patients; this representing but 80 per cent of accommodations, 20 per cent being held in reserve.

Care of the dead.—Plans for proper care of the dead effectively carried out by medical officers and specially trained Hospital Corps men. Through plans made in advance most all Navy dead, except marines buried in the zone of the Army in France, already brought home.

Other activities.—Laboratories and trained personnel established in all naval districts and abroad for wide range in scientific work and sanitary service.

Bureau of Medicine and Surgery undertook researches and pioneer work for the Navy to prepare defense against poison warfare gases. Provided practical

instruction for naval personnel ashore and afloat, including marines detailed for France.

Health of the Navy.—Completeness of organization and medical department efficiency along all lines, preventive as well as in medical and surgical treatment, reflected by the very low death rate from disease during the war—8.8 per 100 per annum, in spite of unprecedented epidemic of influenza and pneumonia.

The conduct of the Navy in war was thoroughly investigated in 1918 by a subcommittee of the House Committee on Naval Affairs. The work of the Medical Department received high praise and the report of the committee stated, "It may well be said that the reason for this successful record is to be found in the bureau's preparedness, due to foresight and cooperation."

Secretary DANIELS. Military justice in all countries and in all ages has too often been hard-boiled. There is nothing in connection with the naval administration in the World War more gratifying than the freedom from criticism of court-martial trials and the administration of justice in securing discipline and obedience. This is always particularly difficult in time of war, but the department introduced modern methods in discipline, in trials, and in punishment. Wherever these principles were carried out in spirit, the best results followed, and, with few exceptions, naval courts vied with the best civil courts in sifting evidence and rendering righteous judgments. Sentences were not long, imprisonment was made endurable by the hope held out to the erring, and the war ended with almost universal commendation of naval courts and naval humane discipline. The Judge Advocate General, Admiral George R. Clark, details the methods and policies which were practised, and it is an important chapter in the naval administration during the World War. I submit this for the record and will not read it. It is as follows:

DEPARTMENT OF THE NAVY,
OFFICE OF THE JUDGE ADVOCATE GENERAL,
Washington.

SUMMARY OF THE ACTIVITIES OF THE OFFICE OF THE JUDGE ADVOCATE GENERAL OF THE NAVY DURING THE PERIOD OF ACTIVE HOSTILITIES AND SINCE THE ARMISTICE OF NOVEMBER 11, 1918, WITH PARTICULAR REFERENCE TO THE INCUMBENCY OF THE PRESENT JUDGE ADVOCATE GENERAL.

At the outbreak of the war we were suddenly confronted with problems not in the book. A nonwarlike Nation, engaged in peaceful pursuits, was rudely awakened to the need of meeting a grave peril that threatened the very foundations of civilization. The need was immediate; the danger pressing. The enemy was at the gate, giving no time for the careful and thorough training necessary for complete readiness for war. All are familiar with the patriotic response made to the call to arms by the young men of America, but few realize the difficulties and perplexing problems brought about by the sudden growth of the Navy from 50,000 to 600,000 men and officers, wholly unfamiliar with naval discipline and life at sea. It sometimes happened that boys from the farm, a few weeks, or at most a few months, after leaving the plow found themselves at the masthead of ships at sea looking out for the periscopes of the enemy submarines. It was a difficult situation where, so far as the work of discipline was concerned, a nice balance had to be preserved between sternness and clemency, between severity and leniency.

In the annual reports of the Judge Advocate General, addressed to the Secretary of the Navy, will be found detailed and comprehensive statements of the work done in the several subdivisions of his office; while the incorporation, in this summary, of the main body of these reports would be undesirable from several points of view, principally because of their statistical and repetitious character, still a résumé, or digest, of their contents may serve, in some measure at least, to convey an idea, if not a complete understanding, of the scope and fullness of the office work, as well as the increase therein incident to a state of

war and demobilization and the progress and improvement in the methods devised and adopted in order to handle the increased volume of business.

Brief mention will be made of the work of the several divisions of the office, reserving for especial attention that division alone which has come to be held by the naval service at large and by the interested public and which, indeed, seems to be connoted by the very name of the office itself, as the primary and most important branch, in fact the *raison d'être* of the office—the Division of the Administration of Justice. It is in this division that expansion and development of principles and practice have been most marked during the period under consideration; for while fundamental principles are to a large extent immutable, the practical application of them must necessarily be progressive and in keeping with varying conditions which, especially in time of hostilities, demand vastly increased requirements of personnel in character and performance.

During the two fiscal years covered by this summary there were reviewed 3,281 examinations for admission to commissioned grades in the Navy and the Marine Corps, including the reserve forces; 1,596 examinations for permanent promotion in rank; and 182 examinations for retirement for physical disability incident to service.

During the same period there were reviewed, courts of inquiry, 517; boards of investigation, 1,889; and boards of inquest, 957.

Likewise, for the same period, Senate and House bills, joint resolutions, and proposed amendments referred to the department and considered by this office were as follows: Senate, 76; House, 132; bills drafted, 70; in addition to which a great mass of legislation proposed, submitted, or enacted has been considered, discussed, and acted upon.

Twelve questions of paramount importance have been submitted to the Attorney General for his determination of the points of law involved; and in connection therewith it is a matter of pride to this office that our interpretation was upheld in the large majority of the questions involved.

Requests for decisions on question of pay by the Comptroller of the Treasury numbered 714, of which 496 were answered by the department, the remainder being submitted to the comptroller. This has been a very important and absorbing work, largely in the interest of the enlisted personnel.

As indicative of the greatest factor influencing the volume of work devolving upon this office it may be well to note that during the period concerned the personnel of the naval service in all its branches reached a maximum of 35,777 officers and 579,958 enlisted, an aggregate of 615,735.

Turning now to the subject of the administration of justice in the naval service, certain portions of the annual reports for the fiscal years 1918 and 1919 are quoted just below:

1918: During the past year the volume of work in this division has materially increased, due almost wholly to the enlarged personnel of the Navy and Marine Corps. The records of all the cases of whatsoever character tried by either general or summary courts-martial or deck court, as well as cases investigated by courts of inquiry and boards of investigation, are reviewed in this division.

An endeavor, attended with exceptional success, has been made to keep the review of these records up to date, and it is most unusual for a week to elapse before a case is finally disposed of and letters promulgating the action of the department sent out. * * *

Every effort is being made to decrease, in so far as may be practicable, the proportionate number of trials by court-martial. Such action seems particularly wise at this time, inasmuch as so large an element in the service is composed of men without previous military training, who are animated by a laudable desire to serve the Republic, coupled with a lack of definite understanding of the meaning of and necessity for an exact discipline.

The foregoing table (not shown here) indicates a very considerable reduction in the proportionate number of trials of enlisted men during the fiscal year 1918. This means not only that the services of a smaller number of delinquents have been removed from the sphere of usefulness with the colors, but also that the time of many officers serving in connection with courts has been conserved for active duties instead of being expended in the administration of justice. It is interesting in this connection to observe that during 1917 there was an average of 95,548 men under naval jurisdiction, whereas during 1918 there was an average of 412,415 men subject to naval administration. The number of men tried by general court-martial in 1917 was 1,816, which was increased to 4,831

in 1918. In other words, the percentage of increase in the service has been 331 per cent, whereas the percentage of increase of trials has been but 166 per cent.

* * * * *

The number of letters petitioning for clemency in the case of naval prisoners has greatly increased. All cases that ask for financial assistance are investigated through the Red Cross or Associated Charities, and where examination shows that financial conditions are such as to produce actual destitution the department authorizes assistance. The act of October 6, 1917, known as the war-risk insurance act, authorizes a compulsory allotment in the case of all men having dependent wife or children, and it has been held by the War Risk Insurance Bureau, and acquiesced in by the Navy and War Departments, that this compulsory allotment takes precedence over loss of pay under sentence of court-martial. This holding is founded upon the view that Congress designed the compulsory allotment for the aid of dependents and not as a benefit to the soldier or sailor himself.

The effort is a constant one to make proper allowance for the youth and inexperience of those who make up the greater proportion of the naval service of to-day. While it is essential to bear in mind the fact that an even higher state of discipline and efficiency must be maintained under war conditions than when the country is in a peace status, and that grave duties and responsibilities rest upon even the youngest members of the service in these days, yet clemency is extended whenever the conditions of the case seem to furnish any justification therefor.

To increase efficiency and maintain and improve discipline in the naval service, as well as to promote the welfare of new men now finding themselves in situations of serious responsibility, recommendation has been made that the parents of recruits be requested to impress upon their sons the importance of strict compliance with regulations, obedience to orders, study of conditions, and respect for seniors. It is thought that if this course be followed it will aid greatly in strengthening the hands and lessening the problems of those charged with perfecting our first line of defense.

As a further means to this end measures are being taken to restrict the number of general courts-martial and confine that corrective agency to the very serious offenses, leaving all other misdemeanors to be tried by summary courts-martial and deck courts or settled by the action of the commanding officer. This action will increase the force of the general court as a deterrent and corrective measure and at the same time lessen the number of men lost to the service by being sent to prisons. This policy is particularly appropriate at this time, when ships and stations are manned with youths who have not had the benefits of the usual service at training stations.

From the very beginning of his incumbency the present Judge Advocate General has given his personal thought and attention very specially to this division of his multifold duties. Upon his assumption of office the effects of war conditions upon the discipline of the naval personnel were beginning to be felt in a decided manner. The enormous and rapid expansion of the Navy personnel had brought under the discipline and restrictions of the Navy regulations hundreds of officers and thousands of enlisted men, nearly all of whom were utterly unfamiliar, entirely unacquainted, with naval rules, requirements, and regulations relating to both "do" and "don't." War psychology, mental attitude under stress, mental and physical endurance—all of these were factors entering into the performance or the neglect of duty, the observance or the breach of discipline.

The Judge Advocate General early realized and steadfastly kept in view the need that would be urgently felt to harmonize two outstanding elements arising in the new situation imposed by the war. These were:

(a) The maintenance of discipline, especially afloat, along with the support of officers intrusted with the authority and responsibility of command.

(b) In cases of the infraction of discipline, the serving out of deliberate and temperate justice, taking into account the offtime youth and inexperience of offenders, as well as the same personal characteristics of members of trial courts, and also the abnormal, though entirely unaccountable, tension which is prone to magnify the gravity of offenses and to dictate unusually severe, if not harsh, punishments in time of war.

The Judge Advocate General was and is firmly convinced that the quality of mercy is not strained even under the unusual conditions attendant upon a state of war, and that, after calm consideration, justice may well be tempered

with mercy in very many cases which at first sight appear to merit the infliction of stern punishment. For this reason he recommended the appointment of an advisory or clemency board for the purpose of considering the question of restoration to duty or other form of clemency in such cases as the department might deem worthy of consideration; such a board was appointed about October 1, 1918.

As a result of the pursuit of this policy there was a noticeable falling off of complaints regarding disciplinary punishments in the Navy. During the active states of the war there were less than one-half of 1 per cent of the personnel undergoing imprisonment.

About August 1, 1919, measures were instituted with the object of expediting the trials of those charged with offenses against discipline, and the procedure was established of dropping all cases pending except those of a very grave nature, in which the delay in bringing to trial amounted to 60 days after the charges had been preferred and the offender placed under detention for trial. It is believed that the certainty of prompt punishment is more conducive to discipline than perhaps severe punishment deferred to a time long after the offense.

Under date of August 14, 1919, the Judge Advocate General addressed the following semiofficial letter to the commander in chief of the Atlantic Fleet, Admiral H. B. Wilson, United States Navy:

"MY DEAR WILSON: It is very desirable as far as possible to maintain uniformity in the dispensing of justice in the naval service, and to this end I am inclosing a copy of a letter that I sent to Rodman, which relates to court-martial matters and which I believe will be of interest and service to you.

"Owing to demobilization, loss of enlistment records, etc., there has been an unfortunate delay in some cases of men who have been confined or restricted at navy yards, naval stations, and receiving ships, pending the determination of the disciplinary action to be taken in their cases. Manifestly it is essential that men who have committed alleged offenses should receive an expeditious trial of their cases. In order to relieve and correct the situation, the department directed that under certain conditions men be restored to duty who were awaiting action on their cases. I am inclosing a copy of this letter, which will be of interest to you.

"The proper and expeditious handling of offenses against discipline is one of the important problems connected with personnel, and I am forwarding this correspondence to you in order that you may have information as to some of the recent actions of the department in this regard."

The letter to Admiral Rodman, referred to as inclosed, reads as follows:

JULY 15, 1919.

MY DEAR RODMAN: In consonance with our conversation of several days ago and in conformity with your request, I submit the following suggestions for such consideration as you may desire to accord them.

The only object of punishments by court-martial is the preservation of discipline. The law provides four ways for the punishment of offenders, viz:

1. By the commanding officer.
2. By deck courts.
3. By summary court-martial.
4. By general court-martial.

It is believed that these ways should be resorted to in their order, i. e., that resort should not be had to a deck court until the power of the commanding officer has been exhausted and so on up exhausting the lesser before proceeding to the greater, having due regard to the seriousness of the offense committed.

When it is decided to resort to court-martial, either summary or general, there are certain matters which ought to receive care in advance of trial aside from the preparation of the charges and specifications and one of the most important of these is the determination of the eligibility of the members of the court. In the opinion of this office an officer should be considered ineligible to sit as a member of a court-martial in a trial if he (a) is the officer who convenes the court, or he must have already have formed an opinion upon the merits of the case or he would not have ordered the trial; (b) is a witness for the prosecution (see *Changes, Naval Courts and Boards*, p. 16, sec. 139 (a)); (c) was investigator or member of a board of investigation of matters upon which the specifications are founded; (d) has a personal interest in the case; (e) is not of the proper rank.

The judge advocate of the court should satisfy himself whether any of the above-mentioned disqualifications apply to any of the members, and is so, should immediately inform the convening authority. If any officer ordered as a member of a court-martial is disqualified by reason of the above he should himself immediately communicate the fact to the convening authority. Finally the president or senior member should, when the court meets, and before trial begins, also satisfy himself as to the eligibility of members, and if not so satisfied he should communicate with the convening authority. None of the above abridges the right of the accused to challenge any member.

The accused should always be provided with counsel, preferably of his own choice, but otherwise detailed by the convening authority, but counsel may not properly be forced upon him against his will. Such counsel should, if possible, be an officer of sufficient rank and experience to cause the accused to be satisfied that his interests will be carefully guarded during trial. The primary duty of the judge advocate is the vigorous prosecution of the case, and although in our practice, especially when the accused is without counsel, this officer is required to give the accused his assistance, both in and out of court in preparing the defense, still it is better that the judge advocate be not required to act in such dual capacity if it can be avoided, for, on disputed points, he may be compelled to argue on both sides, a difficult thing to do. The point is, that the accused be satisfied that his defense, if he have any, is properly presented to the court.

Preliminary examination of offenses should be much more thorough than they have been of late. It is the tendency of this office to become more conservative in returning cases to courts-martial for a revision of the findings and sentence if they be legal.

(NOTE.—Court-martial order No. 309 of December 13, 1919, contains the following:)

"The President of the United States, as recently as July 14, 1919, has directed, with regard to this matter, as follows:

"No authority will return a record of trial to any military tribunal for reconsideration of—

"1. (a) An acquittal.

"(b) A finding of not guilty of any specification.

"(c) * * *.

"(d) The sentence originally imposed, with a view to increase its severity, unless such sentence is less than the mandatory sentence fixed by law for the offense or offenses upon which a conviction has been had.

"2. No military tribunal in any proceedings on revision shall reconsider its finding or sentence in any particular in which a return of the record of trial for such reconsideration is herein prohibited. * * * (G. O. No. 88, War Dept., July 14, 1919.)"

"It would appear that the return of a naval case to a naval court for reconsideration of an acquittal, or to impose a more severe sentence upon a conviction, would be in direct contravention of the President's published policy in the premises and of his mandate to courts of the military service. Legislation now pending before Congress provides *inter alia* that cases of acquittal shall not be returned to an Army court-martial for reconsideration (H. R. 367)."

While the power of convening authorities is not in any way abridged by this tendency, it is recommended that the power be used only to prevent a manifest and obvious failure of justice; for this power has, upon occasions, been improperly employed to impose upon a court, under threat of disciplinary action, the will of the convening authority (file 26262-6318), which action naturally called forth unfavorable comment in courts-martial orders.

So the general court-martial should be reserved for the most serious offenses; its moral effect upon discipline should not be minimized by the submission to it of cases that might be settled by an inferior court.

It is the opinion of this office that in awarding the efficiency pennant the state of discipline and the means for its establishment and maintenance (not forgetting the number of courts, desertions, etc.), should be assigned greater weight than in the past.

Inclosed herewith is a schedule of punishments by which this office and the Bureau of Navigation are governing their action upon cases.

Finally, it is recommended that all officers, petty officers, and older men be encouraged to look after recruits carefully, to study their character, and their interests when the exigencies of the service permit, and that a much greater use be made of discharges. Furthermore, when a man seems to be getting into

trouble a great deal, or can not get along without friction and constant reports against him, he should be carefully examined by the medical officer (psychiatrist) in order to determine whether he be normal or not. Many of the enlisted men now in prison (about 60 per cent) should never have been enlisted, and the only proper way to deal with them is to discharge them from the service.

The following is a schedule adopted by the Bureau of Navigation and the office of the Judge Advocate General to be used as a guide to govern in cases wherein the offense is absence without leave. Similar action may be taken in cases of other offenses where the merits of the case indicate that such clemency is warranted.

Absences under 30 days, surrendered; to be tried by summary court-martial, except in aggravated cases.

Absences over 30 days, surrender; to be tried by general court-martial.

Actual restriction not less than two months, with loss of pay remitted in accordance with I-4893. Dishonorable discharge in abeyance.

Absences from 10 to 30 days, delivered; to be tried by general court-martial.

From the form to be used in taking action in the above cases it will be noted that the month's pay and the month's probation with dishonorable discharge in abeyance as well as the full restricted period is indeterminate, so that in taking action on cases, a latitude is available such that varying degrees of mitigation can be taken to cover the merits of the individual cases. Copy of form attached.

The following is a schedule as applied to the classes of cases, as above set forth, to be used as a guide in taking action thereon:

Class.	30 to 50 days.	50 to 60 days.	60 days.
Absence over 30 days, surrender.....	Restriction, 4 months.....	5 months.....	6 months.
Actual restriction, 1 to 2 months.....	{ Pay, 4 months.....do.....	Do.
	{ Probation, 4 months.....do.....	Do.
		10 to 20 days.	20 to 30 days.
Absence, 10 to 30 days, delivered.....	Restriction, 4 to 5 months....	5 to 6 months.	
Actual restriction, 3 to 2 months.....	{ Pay.....	Do.	
	{ Probation.....	Do.	

Apply clemency for record, age, circumstances in this schedule.

In case of delay in trial, deduct from the actual restriction not to exceed one month's reduction.

As indicative of the thought and study given by this office to the maintenance of discipline through the corrective and deterrent agency of courts-martial there is quoted immediately below a letter date April 8, 1919:

"From: The Judge Advocate General.

"To: The Chief of Naval Operations.

"Via: The Chief of the Bureau of Navigation.

"Subject: Policy regarding courts-martial.

"1. I earnestly recommend the adoption of a general policy especially in war time, that would resolve all court-martial cases into a question as to whether or not the accused is guilty of neglect, incompetency, or general culpability. Errors of judgment can not be cured by court-martial punishments, nor can it be pleaded, under such circumstances, that such measures benefit the service in acting as a deterrent.

"2. It can be safely assumed that our people in the service, individually and collectively, are, and have been, putting forth their best energies, giving the best that is in them to their duties, ashore, and afloat. If in spite of all this good work casualties sometimes occur, they can, with a very few exceptions, be attributed to the abnormally difficult conditions brought about by war situations that demand sound judgment and prompt action under extremely trying circumstances.

"3. A danger lies in the too free exercise of the punishing power in making officers forget that 'war can not be successfully conducted without taking risks.' The advocates of the present custom urge that it serves to clear up the

question and in that way frequently acts favorably for the accused, but it is quite possible that pending charges may operate to prevent or, at least, delay, the selection for promotion of officers who afterwards may be 'fully and honorably' acquitted. Courts of inquiry are the means provided for clearing up doubtful cases, and, in the main, serve the purpose very well. A recent communication from a battleship force where this important question was given careful consideration reports the low percentage of four-tenths of 1 per cent of trials by general court-martial. This most commendable achievement shows that discipline can and should be, maintained without frequent resorts to courts. A striking contrast is presented in the reports of two forces, serving in the same waters in which one (the latter), records 17 cases (3 to prison), while the other records 41 cases (38 to prison).

"4. The foregoing relates mainly to the number of courts. In regard to the punishments assigned, so far as officers are concerned I am of the opinion that the corrective and deterrent effect does not wholly depend upon the degree of punishment. The number of turns of the knife in the wound is a detail. The fact that the thrust has been made at all is fatal to the hopes and pride of the naval officer whose whole ambition is to serve faithfully and efficiently without blot upon record.

"5. All these facts should be carefully weighed by the reviewing authorities, who in the security and quiet of their surroundings and having the advantage of position in judging 'what might have been,' may unconsciously and innocently enough fall into an attitude of unnecessary severity."

Upon the subject of the recommendations contained in this letter the following views of the Bureau of Navigation and the Office of Naval Operations, recorded in indorsements, are quoted:

[First indorsement.]

APRIL 21, 1919.

From: Bureau of Navigation.
To: Chief of Naval Operations.
Subject: Policy regarding courts-martial.

1. Forwarded.
2. The recommendation of the Judge Advocate General is concurred in.
3. It is believed that a properly constituted court of inquiry is competent to determine whether or not any culpability exists, and that the recommendation of such a court should in general be approved. In war time commanding officers are often forced to make rapid decisions, and not infrequently an error of judgment has led to disaster, which was subsequently proved to be due to unusual and unexpected conditions and not to any neglect, incompetency, or culpability on the part of the commanding officer concerned.

R. H. LEIGH, *Acting*.

From: Chief of Naval Operations.
To: Secretary of the Navy.
Subject: Policy regarding courts-martial.

1. Forwarded.
2. The recommendation of the Judge Advocate General is concurred in.
3. The lack of distinction that is made at present between errors in judgment and acts in which the offender willfully commits some action which probably renders him subject to court-martial should be rectified.
4. It is recommended that courts-martial for errors of judgment in which culpable inefficiency does not enter, or which do not show incompetency, should not be given.

J. S. McKEAN, *Acting*.

Approved by—

F. D. ROOSEVELT, *Acting Secretary*.

Improvement in the mental, moral, and in its broad sense spiritual, condition of the enlisted personnel has ever been the serious and earnest concern of the Judge Advocate General. After a period of reflection on this very important subject, extending over many months, he, on September 18, 1919, addressed the following letter to the Secretary of the Navy:

From: The Judge Advocate General.

To: The Secretary of the Navy.

Via: The Chief of Naval Operations and the Chief of the Bureau of Navigation.

Subject: Suggestions for improved enlisted personnel.

1. The nature and number of offenses in the service indicate a condition that can be improved only by a change in the method of enlisting and training.
* * * The situation is due partly to the lowering of standards made necessary by the demands of war and partly to the contact of our recruits with Old World or European vices.

* * * * *
If our recruiting officers are to be successful, they must be able to go before the country with the assurance that conditions of life in the Navy regarding associates and influences are equal at least to those prevailing in their home communities. A careful analysis of the kinds of offenses and the history of offenders at Deer Island some time ago disclosed the fact that 60 per cent of prisoners should never have been enlisted.

2. In relation to the foregoing the following suggestions are made:

(a) Establish and maintain a very high standard of admission, physical and moral, investigating with painstaking care the history of the applicants, especially with a view of keeping out all who have served in prisons or reformatories. Do not permit competition among recruiting offices based upon numbers alone.

(b) Continue the process of elimination at training stations where the term of training should be at least four months. These stations should be generously supplied with a full complement of picked officers and men as instructors.

(c) Form a training squadron (to which recruits from training stations should be sent) of modern vessels, to operate as an independent unit, but under regular fleet conditions as to maneuvering, target practice, signaling, and the like. Graduate the recruits from this squadron and transfer to the fleet. This squadron would be available for use on special details in emergencies.

(d) Send all persons duly convicted of the moral offenses hereinbefore referred to, to serve sentence at State prisons, making a sharp distinction in this respect between such offenses and those of a military nature.

3. The objection usually made to the plan outlined above is that "there is no time." As well might the builder urge lack of time as the reason for paying scant attention to the foundation of the monument or bridge. It has been said, and with truth, that "the only shots that count are the shots that hit," and it is equally true that the only crews that count are those that have been sorted and trained. Craddock, in command of a squadron superior in gun power to the enemy, lost off Valparaiso because of his raw, ill-trained crew, while, a few weeks later, Sturdee, free from that handicap, won a notable victory off the Falkland Islands.

Lawrence's famous appeal, made on the day that marked our only naval defeat in the War of 1812, might not have been in vain had it been addressed to a crew of veterans. The advantage of the special squadron over the fleet for training purposes is that in the former the instructors, the mentors, are picked men with one purpose, one object, while in the fleet the recruit picks up what he can from men who may be good, bad, or indifferent, and who are not particularly concerned in the upbringing of recruits. Corrective and deterrent institutions have their uses, but their work can be lessened by the adoption of policies that will reduce the number of their inmates. The remedy lies in these policies. A homely parallel is found in the practice of the physician in not placing reliance upon surface applications for skin diseases. He seeks for the source of the trouble in the blood.

4. If not content with a makeshift, day to day, personnel, we want to build for the future, no better time could be found than the present, full of promise of a long peace, to begin the upbuilding of a Navy on sound principles.

5. My excuse for touching upon a subject which, at first glance, may seem without the jurisdiction of this office, is found in my belief that I should fail in my duty if I did not point out conditions indicated by papers crossing my desk, and at the same time suggest measures of relief.

GEO. R. CLARK.

As far back as the 23d of August, 1918, the Judge Advocate General, imbued with the idea of aiding by observation and suggestion in ameliorating the

condition of recruits and in improving the morale of the service, indited the following letter:

"From: The Judge Advocate General.

"To: The Chief of the Bureau of Navigation.

"Subject: Ignorance of recruits regarding regulations and suggested remedies.

"1. The uniformity of excuses and explanations with reference to desertions and 'over leaves' indicates a more or less widespread ignorance on the part of the recruits (of which the services are now largely composed) concerning the seriousness of their offenses in general and the necessity in particular of overcoming the fear of an early return, the first corrective step that can be made.

"2. As remedies for this condition the following suggestions are made:

"(a) Direct all commanding officers, ashore and afloat, to make renewed systematic efforts, through talks or lectures by chaplains, division officers, and commanding officers to impress upon all hand the gravity of the offenses referred to, which are equivalent, in time of war, to turning their backs to the enemy.

"(b) Send to the next of kin, on enlistment, a circular letter requesting, in the interest of the American people, individually and collectively, that they aid in counseling the recruits to comply with regulations, obey orders, trust their seniors, in order that efficiency and discipline may be maintained."

As recently as the 10th of March of the present year the Judge Advocate General again touched upon this question in a letter addressed to the Secretary of the Navy, as follows:

From: The Judge Advocate General.

To: The Secretary of the Navy.

Via: The Chief of the Bureau of Navigation and the Chief of Naval Operations.

Subject: Recommending general order concerning the instruction of recruits.

1. In view of the character and number of offenses disclosed by court-martial cases reviewed in this office, indicating an ignorance of the gravity of the offenses and the serious consequences, it is suggested that a general order be issued directing commanding officers of forces ashore and afloat to take special measures to teach recruits their duties to themselves and to the service in these matters, laying particular stress upon the handicap in obtaining employment in civilian life that goes with a dishonorable or bad conduct discharge. Appeals for a change in character of discharge are of almost daily occurrence.

2. This is a question of great importance at this time when the Navy is losing its experienced men and replacing them with new and untried recruits.

3. It is believed that the action suggested herein, if taken, will result in a reduction in the number of courts.

Some three months after the signing of the armistice of November 11, 1918, the limitation of punishments assignable by courts-martial, as ordered by the President for time of peace, was reverted to.

As of general and pertinent interest in connection with the foregoing summary there are appended copies of remarks by civilian counsel for the accused in certain court-martial cases, showing the esteem in which the underlying fairness and integrity of naval courts are held; also, some tabular statistics relating to court-martial cases in general.

GEO. R. CLARK.

CASE OF ROBERT L. M'MAHON, LIEUTENANT (M. C.), UNITED STATES NAVY.

Mr. Robichon, of counsel for the accused, made the following oral argument:

"Gentlemen, I have come a long distance in Lieut. McMahon's behalf, but I realize that in courts-martial the less said to them by a civilian counsel, the better. I have waited since 9 o'clock this morning to say a word in behalf of Lieut. McMahon. The evidence of the case has been more than covered by my friend, Mr. Carr, and in everything that he says I must concur. I am not in the habit of attending to drunk cases. My experience has led me to more distinguished cases. Particularly so as I saw in the paper the other day that Secretary Baker had ruled courts-martial were instruments of discipline rather than courts of law. But notwithstanding his ruling, some 12 years ago I remember I tried a case in a court-martial room here. I had a very weak case, and I kept constantly interposing objections until the president of the court told me, 'Counselor, this is a court of justice and common sense and not a court of technicalities.' I still take it and believe that the Navy courts are courts of law and follow the courts of the land and the Constitution, which gives every

man a right to a fair trial. My dealings with courts-martial at the navy yard and Navy Department have always convinced me that they rendered justice. Where courts have, through inexperience, convicted a man, the department has never hesitated to set aside the verdict and restore the man to duty, even though he was guilty in fact, but he had a constitutional or legal right to a presumption of innocence." (File 26251-21338.)

CASE OF LIEUT. C. N. PERKINS, UNITED STATES NAVY.

The counsel for the accused, Mr. F. W. Moore, made the following argument: "May it please the court, I might say that I have heard on many occasions there is a sort of a feeling among naval courts-martials regarding civil attorneys appearing before these bodies, but in 10 years' experience at this yard I have not come in contact with such a feeling; and while it is true that the parties who constitute a court-martial are not, of course, skilled lawyers, yet in the last analysis the Supreme Court of the United States and the acts of Congress have stated and ruled that courts-martial are governed by the same rules of evidence and the same rules of procedure that govern civil courts, and the accused on trial is protected by the same presumption of innocence and also by the constitutional rights and guaranties as the defendant tried in the courts of civil jurisdiction. I am quite satisfied in my own mind that courts-martial attempt to administer and do administer with wonderful success what we might term equitable justice rather than what we call legal justice. It is done with a good intent and accomplished with an end and purpose; and having been 30 years a lawyer and reared in a school that has a high opinion of ethics of the profession, I hope this court will welcome rather than resent the assistance which a proper kind of lawyer can give." (P. 92 of the record.)

THE MARINE CORPS—ITS RECORD OF PREPAREDNESS AND ACHIEVEMENT.

Secretary DANIELS. The story of the marines in the World War not only gives glory to the Navy and to our country, but has won the gratitude of all who fought for world liberty. From the beginning of my administration as Secretary of the Navy no branch of the Navy has received more encouragement from me than the

marines. What they have done in war and in peace justifies my high opinion of them and their importance in all operations.

Not long after I came into office I issued an order, after conference with Admiral Dewey, making the major general commandant of the Marine Corps an ex officio member of the General Board. I must say that this action was taken contrary to the views of some of the council of aids, who argued that none but line officers should have membership on the General Board. My reply to them was that, inasmuch as the marines made up one-fifth of the Navy, and no landing or other operations were carried on without marine participation, it was of the highest importance that the other members of the General Board should have frequent conferences with the head of the Marine Corps and that the major general of that corps should have full membership instead of merely being called in to furnish information. When I told Admiral Dewey that I had in mind making this addition to the General Board, he said it was an excellent idea and added, "I wonder it was never done before."

From the time the European war began, in 1914, officers and men made especial efforts to improve the efficiency of the corps and excel the high standard it maintained. That they succeeded notably is attested by the fact that no branch of our military service was in a higher state of readiness, as was proved by their services in 1914, 1915, and 1916, as well as their record in France.

Fighting shoulder to shoulder with their comrades of the Army, the marines made a glorious record in France. They took part in the capture of Hill 143, Bouresches and Belleau Wood, in the Aisne defensive, and in recognition of their audacious courage and success the French changed the name of Belleau Wood to the "Bois de la Brigade de Marine"—the wood of the Marine Brigade—a compliment not paid to any other fighting body in the history of war in an old fighting country like France, which shows that they felt that they owed to the marines at Belleau Wood a debt that they could never pay officially, and they changed the name of the wood from Belleau Wood to the Wood of the Marine Brigade.

In the Aisne-Marne offensive (Soissons) the Second Division, of which they were a part, took Beaurepaire Farm and Vierzy, capturing 3,000 prisoners and 66 field guns. Of this counter-attack Gen. Pershing said: "Due to the magnificent dash and power displayed on the field of Soissons by our First and Second Divisions, the tide of war was definitely turned in favor of the Allies." They were employed in the operations in the Marbach sector, near Pont-a-Mousson, and in the St. Mihiel offensives.

It was the Second Division, under command of Gen. John A. Lejeune, United States Marine Corps, which included the marine brigade, that, operating with the Fourth French Army, led the attack on the German defenses in the Champagne and captured Blanc Mont Ridge and St. Etienne. This victory, combined with the operations of the French to the right and left, the orders state "freed Rheims and forced the entire German Army between that city and the Argonne Forest to retreat to the Aisne, a distance of 30 kilometers." Fighting up to the very end of hostilities, taking part in the Meuse-Argonne offensive, and crossing the river Meuse under heavy fire on the morning of November 11, 1918, being estab-

lished on the heights of the far bank of the Meuse, after an advance of 30 kilometers, by the hour the armistice went into effect.

No statement of the achievements of the Navy in the World War would be complete without a large place being given to what was accomplished by the marines. The act of August 29, 1916, increased the authorized strength of the Marine Corps from 9,921 to 14,981 enlisted men, with a corresponding increase in the number of officers, and also authorized the President in emergency, to further increase the corps to 17,400 enlisted men and 693 officers, which he did by Executive order on March 26, 1917. I beg to call your attention to the fact that the President issued the order before the Congress declared war. With the enlargement of the corps, recruiting and training were pushed and its responsible officers did everything possible to make the Marine Corps ready for the great work they were destined to do. The corps, during the war period, grew to a total of 75,000.

I wish to give you a summary of its service in the war which you will find more completely set forth in the excellent history prepared by Maj. Edwin N. McClellan, the able historian of the Marine Corps. I submit this for the record.

(The document last referred to is here printed in the record, as follows:)

THE MARINE CORPS IN THE WORLD WAR.

When war was declared, April 6, 1917, the Marine Corps was composed of 462 commissioned officers, 49 warrant officers, and 13,214 enlisted men on active duty, a total of 13,725, and while the corps was expanded to an actual strength, including reserves, of 75,101 officers and enlisted men, its high standard was never lowered. When these figures are compared with the approximate strength of 3,100 at the end of the Civil War, and of 4,800 at the end of the Spanish War, the growth of the Marine Corps is illustrated.

Despite the fact that on the outbreak of war, 187 officers and 4,546 enlisted men were on duty beyond the continental limits of the United States, and 49 officers and 2,187 enlisted men were serving on board the cruising vessels of the Navy, only five weeks later, on June 14, 1917, the Fifth Regiment of Marines, consisting of 70 officers and 2,689 enlisted men, approximately one-sixth of the enlisted strength of the corps, competently organized and ready for active service, sailed on the *Henderson*, *De Kalb*, and *Hancock* from the United States, forming one-fifth of the first expedition of American troops for service in France.

This regiment was soon joined by the Sixth Regiment and the Sixth Machine Gun Battalion of Marines, and the Fourth Brigade of Marines was organized, and as one of the two Infantry brigades of the Second Division of Regulars engaged in actual battle in no less than eight distinct operations in France, of which four were major operations.

The French Army recognized the splendid work of the Fifth and Sixth Regiments of Marines by citing them no less than three times in Army orders for achievements in the Chateau-Thierry sector, in the Aisne-Marne (Soissons) offensive, and in the Meuse-Argonne (Champagne). The Sixth Machine Gun Battalion was similarly cited for its work in the Chateau-Thierry sector and the Aisne-Marne (Soissons) offensive. The Fourth Brigade received a similar citation for its work in the Chateau-Thierry sector.

Within a year after the outbreak of war the Marine Corps placed in France about as many enlisted men as there were in the corps when war was declared.

During the month of June, 1918, when the battle deaths around Hill 142, Bouresches, Belleau Wood, and Vaux of Americans attached to the Second Division amounted to 1,811 (of which at least 1,062 were marines) and the nonfatal casualties to 7,252 more (of which 3,615 were marines), the legislative strength of the Marine Corps was but 1,323 officers and 30,000 enlisted men; the actual strength on June 30, 1918, including reserves, was 1,424 officers and 57,298 enlisted men, and of this total about 300 officers and 14,000 enlisted men were in France. These latter figures include those marines who suffered casualties in the battles of June, 1918.

Approximately 30,000 marines were sent overseas to join the American Expeditionary Forces, and 1,600 for naval duty ashore.

During the war a great many additional marine detachments were detailed to guard radio stations, naval magazines, ammunition depots, warehouses, cable stations, and for other naval activities, and the detachments already established were largely augmented. No call was made for additional marines for naval purposes that was not fully met, and this is of especial interest as the Marine Corps is essentially a part of the Naval Establishment, and its first duty is to fill all naval needs and requirements.

The Marine Corps, while maintaining the Fourth Brigade of Marines, a total of 258 officers and 8,211 enlisted men, that fought in eight battle operations suffering approximately 12,000 casualties, placed and maintained the Fifth Brigade of Marines of the same strength in France; supplied the commanding general of the Second Division, and many officers on his staff; furnished a considerable number of officers to command Army units of the Second and other divisions, and for staff and detached duty throughout the American Expeditionary Forces; participated in the naval aviation activities in France and in the Azores; and during the period of the war succeeded in performing in a highly satisfactory manner the naval duties required of it, including the maintenance of two brigades of prewar strength standing by to protect the Mexican oil fields, and as an advanced base force in Philadelphia; one in Cuba; one in Santo Domingo, and one in Haiti; administered and officered the Haitian Gendarmerie and Guardia Nacional Dominicana; as well as providing efficient marine detachments for numerous naval vessels, and maintaining garrisons at the numerous navy yards and naval stations in the United States and in the Virgin Islands; Guantanamo Bay, Cuba; Pearl Harbor, Hawaiian Islands; Guam; Cavite and Olongapo, P. I.; Managua, Nicaragua; Peking, China; San Juan, P. R.; London, England; Cardiff, Wales; Paris, France; and the Azores; and supplied many officers and enlisted men for special and detached duty at home and abroad.

CORPS INCREASED FROM 10,265 IN 1916 TO 72,963 IN 1918.

The naval appropriation act of August 29, 1916, increased the authorized strength of the Marine Corps from 344 officers and 9,921 enlisted men to 597 officers and 14,981 enlisted men, and the President was authorized in an emergency to further increase the corps to 693 officers and 17,400 enlisted men, which he did by Executive order on March 26, 1917.

On April 6, 1917, Congress declared "that a state of war exists between the United States and the Imperial German Government" and one and one-half months later, on May 22, 1917, temporarily increased the authorized strength to 1,197 commissioned officers, 126 warrant officers, and 30,000 enlisted men. Finally, the act of July 1, 1918, temporarily increased the Marine Corps to 3,017 commissioned officers, 324 warrant officers, and 75,500 enlisted men, which is the maximum strength ever authorized for the Marine Corps. Of this number 17,400 were permanent and 58,100 temporary. In addition to the above, the act of August 29, 1916, which established the Marine Corps Reserve, permits the enrollment of reserves, without limit as to number, and on April 6, 1917, there were enrolled, subject to call to active duty, three Reserve commissioned officers, 24 national naval volunteer officers, 36 Reserve enlisted men, and 928 enlisted National Naval Volunteers. There were also available for recall to active duty 65 Regular retired commissioned officers, 1 Regular retired warrant officer, and 210 Regular retired enlisted men.

On April 6, 1917, the strength of the Marine Corps on active duty was 511 officers and 13,214 enlisted men; total, 13,725. On November 11, 1918, it had 2,474 officers and 70,489 men on active duty, a total of 72,963, or nearly fivefold increase during the war period.

On December 11, 1918, the Marine Corps attained its maximum strength on active duty, which was distributed as follows:

Regular commissioned officers.....	1, 678
Retired officers on active duty.....	44
Reserve commissioned officers.....	452
Regular warrant officers.....	257
Reserve warrant officers.....	31
Regular enlisted men.....	65, 666
Reserve enlisted men.....	6, 704
Female reservists.....	269

Total..... 75, 101

WHERE MARINES SERVED DURING THE WAR.

During the period of the war marines served ashore and afloat all over the world. The following tables show where they were located at the outbreak of the war and on the date the armistice became operative:

Location of marines on Apr. 6, 1917, and Nov. 11, 1918.

¹ Including enlisted men commissioned in Europe.

Marine detachments also served on board our battleships and on many of the cruisers which acted as escorts for the vessels transporting Army troops to Europe.

HOW OFFICERS WERE OBTAINED AND TRAINED.

The outbreak of war made it essential that the corps should be filled as far as practicable with officers who had had prior military experience and training, and immediate steps were taken to arrange for the designation and examination of Marine Corps warrant officers, noncommissioned officers, graduates of military colleges, and other civilians with military experience and training.

The appointment of officers subsequent to the declaration of war up to October, 1917, both for the permanent service and for the temporary increase authorized for the duration of the war, were drawn from the following sources:

Graduates of the Naval Academy.....	6
Former officer of the Marine Corps.....	1
Former graduate of the Naval Academy.....	1
Warrant officers and paymaster's clerks of the Marine Corps.....	89
Meritorious noncommissioned officers of the Marine Corps.....	122
Reserve officers and National Naval Volunteers.....	36
Graduates of military colleges.....	284
Other civilians with prior military or naval experience or training.....	136
Other civilians passing the competitive examination held July 19, 1917.....	86

In the summer of 1917 it was decided that no further appointments of civilians to the rank of second lieutenant would be made during the continuance of the war, and that all vacancies occurring in that grade, not required for graduates of the Naval Academy, would be filled by the promotion of meritorious noncommissioned officers. This decision was promulgated to the service in Marine Corps Orders, No. 25 (Series 1917).

In carrying out this policy orders were issued to commanding officers of every post and station, both at home and abroad, as well as those on board ship, to the effect that all commissioned officers would be taken from the ranks, and that the number of men to be designated from each post to attend the training camp

would be a certain percentage of the number of men stationed at such post or station. Each commanding officer was ordered to convene a board or three officers qualified for entry to the officers' training camp at Quantico, Va. Some 600, the limit that could be accommodated, were selected for the first camp, which was established at Quantico in April, 1918. The candidates were given a rigid course of instruction and intensive training. Some of the studies pursued were: Infantry drill regulations, manual of interior guard duty, bayonet training, bombing, minor tactics, military engineering, military topography, administration, military law, lectures on gas and on sea duty, and a practical course on the rifle range.

The training at these camps was most intensive and thoroughly competitive, so that a man's position depended entirely upon himself. The material to draw from was so excellent that comparatively few of those who entered the camps failed to receive commissions, and many of the young men so commissioned who were assigned to duty abroad demonstrated that their selection was fully justified.

Many officers also received special training in the schools of the overseas depot at Quantico, Va.

The majority of the members of the first officers' training camp were graduated in July, 1918. Three hundred of this camp were commissioned on July 15, 1918, and 91 on August 15, 1918.

The same proportionate allowance that was made in the United States was also designated for the marine serving in France, and similar means were instituted there to carry out the policy of selection of men for the training camp. As a result of the camp established over there, 164 second lieutenants were appointed from the Fourth Brigade in France.

The second officers' training camp was opened at Quantico, Va., on August 20, 1918, and of the 570 men enrolled 432 were graduated December 16, 1918, and 172 from the Army candidate school in France, who, immediately upon graduating, were enrolled as second lieutenants (provisional) in class 4, Marine Corps Reserve, and subsequently appointed temporary second lieutenants in the Marine Corps. There were 235 graduated in July, 1919, from the third officers' training camp who were enrolled as second lieutenants (provisional) in class 4, Marine Corps Reserve, and assigned to inactive duty, as were also the 48 graduates of the Army candidate school in France.

Sixty-nine officers were graduated from the Marine Corps school of machine-gun instruction at Utica, N. Y.

TRAINING OF ENLISTED MEN IN THE UNITED STATES.

The Marine Corps system of training for the enlisted personnel during the war was thorough and excellent in every respect.

For a short time after the outbreak of the war temporary recruit depots were opened at the navy yards at Philadelphia, Pa., and Norfolk, Va., with a capacity of 2,500 at the former and 500 at the latter. These were used until the regular recruit depots at Paris Island, S. C., and Mare Island, Calif., could accommodate the recruits. These two recruit depots were greatly enlarged, both in size and scope, and were soon able to meet all demands made upon them.

At the beginning of the war the course of recruit instruction at the recruit depot, Paris Island, was of eight weeks' duration, and with but very few exceptions every recruit passing through this depot received eight weeks' instruction. At the Mare Island recruit depot the recruits received 12 weeks' training from April 6 to 28, 1917; 9 weeks from April 29, 1917, to June 21, 1918; and 8 weeks from June 22 to November 11, 1918.

The following table gives a list of the special schools at the Paris Island recruit depot and the number of graduates from each during the period between the outbreak of war and the date the armistice became operative:

Noncommissioned officers' school.....	2, 144
Field music school.....	493
Radio school.....	143
Signal school.....	232
Band school.....	247
Clerical school.....	236
Pay school.....	78
Cooks' and bakers' school.....	150
Total.....	3, 723

The following table illustrates what was accomplished by the two recruit depots:

Depot.	In training.		Maximum strength of post.	Maximum number of recruits at one time.	Total recruits handled.	Maximum capacity.
	Apr. 6, 1917.	Nov. 11, 1918.				
Parris Island.....	835	4,104	16,601	13,286	46,202	13,060
Mare Island.....	358	1,143	2,799	2,470	11,901	3,000
Total.....	1,193	5,247	19,400	15,756	58,103	16,060

After leaving the recruit depots at Paris Island and Mare Island, advanced training was given the men at Quantico, Va. This training was most intensive, and as a result all the organizations which were trained there attained a high state of efficiency. It was made to approximate as nearly as practicable the real service which the men would have in the American Expeditionary Forces in France.

The first troops arrived at the marine barracks, Quantico, Va., on May 18, 1917. The maximum enlisted strength was 9,849 on September 12, 1918. The maximum number of officers present at one time was 484—on August 16, 1918. The strength on November 11, 1918, was 329 officers and 8,798 enlisted men. From May, 1917, to November 11, 1918, approximately 1,000 officers and 40,000 enlisted men passed through Quantico.

In addition to giving the enlisted men general training at Quantico in preparation for overseas and other duty, the overseas depot was established on May 19, 1918, for the double purpose of organizing and training units of the Marine Corps for service with the American Expeditionary Forces.

Prior to the organization of this depot, the Fifth and Sixth Regiments, the Sixth Machine Gun Battalion, the Base Battalion of the Fifth Regiment, and two replacement battalions had left the United States and had become part of the American Expeditionary Forces.

The overseas depot consisted of an administrative staff and the various sections, as follows: (a) The specialists' schools for the technical training of the Infantry and machine gun and the coordination of these specialists' arms; (b) the tactical department for the instruction and training of overseas units in new tactical principles; (c) the enlisted staff school, for the training of first sergeants, mess sergeants, cooks, company clerks, armorers, etc. Two French and four Canadian officers, who had abundant experience in the fighting in Europe, were assigned, as advisors of the commanding officer.

About 85 per cent of the troops forming the detachments arriving at the overseas depot for service in France had undergone not less than 8 nor more than 12 weeks' training at the regular recruit depots of the Marine Corps. This facilitated the more advanced and specialized training they were to receive at the overseas depot.

The following units were organized by the overseas depot: Third, Fourth, Fifth, Sixth, Ninth, Tenth, Eleventh Separate Battalions; Second and Third Machine Gun Battalions; Fifth Brigade Machine Gun Battalion; Second and Third Separate Machine Gun Battalions; Eleventh and Thirteenth Regiments—total, approximately 16,000 officers and enlisted men. The Seventh and Eighth Separate Battalions were organized and sent to France from marine barracks, Paris Island, S. C.

In addition to the training described above, 69 officers and 2,084 enlisted men, a total of 2,153, graduated from the Marine Corps School of Machine-Gun Instructions at Utica, N. Y.

TRAINING IN FRANCE.

On June 27, 1917, the first battalion of the Fifth Regiment landed in France and on July 3, 1917, the entire Fifth Regiment was under canvas on French soil. From that date every effort was made to train the men and officers. Elements of the Fifth Regiment trained as a part of the First Division of Regulars from July 15, 1917, to September, 1917, in the Gondrecourt training area. From September, 1917, on, the training of the available units of the Fourth Brigade

as a unit of the Second Division of Regulars was conducted in the Bourmont training area.

Until February, 1918, the training of the marines in France was handicapped by the fact that units of the brigade were engaged in duties along the line of communications (Services of Supply), one company and a battalion commander being absent in England until March. It was not until the middle of February that the Fourth Brigade of Marines (less the company in England) was conducting its training as a brigade with any degree of satisfaction. Owing to the well-trained condition of the individual marine this condition did not vitally affect his professional ability, as was so distinctly shown by his later accomplishments.

The Fourth Brigade continued its training in the Bourmont training area until the middle of March, 1918, when it entered the front-line trenches in the Verdun sector.

THE FOURTH BRIGADE OF MARINES.

The Fourth Brigade of United States Marines was composed of the Fifth and Sixth Regiments of Marines and the Sixth Machine Gun Battalion of Marines.

From June 27 to the middle of September, 1917, the Fifth Regiment was a unit of the First Division of Regulars. Although the Fifth Regiment was the only organization of marines in France at the time, the Fourth Brigade was formed on October 23, 1917, when Col. Charles A. Doyen cabled acceptance of his appointment as brigadier general. From October 26, 1917, to August 8, 1919, the Fourth Brigade was a part of the Second Division of the Regulars, except from October 20-23, 1918, when the brigade was provisionally at the disposal of the Ninth French Army Corps, in the vicinity of Leffincourt. On August 8, 1919, the brigade was transferred back to the naval service.

On May 29, 1917, in accordance with directions issued by the President, the Secretary of the Navy directed the major general commandant "to organize a force of marines to be known as the Fifth Regiment of Marines, for service with the Army as a part of the first expedition to proceed to France in the near future." The Fifth Regiment was accordingly organized at the navy yard, Philadelphia, Pa., on June 7, 1917, with Col. Charles A. Doyen in command, and Maj. Harry R. Lay as adjutant.

Gen. Pershing and his staff, accompanied by two marine officers, preceded the first expedition to France, sailing late in May, 1917, from the United States.

The final report of the American commander in chief includes the following:

"The offer by the Navy Department of one regiment of marines to be re-organized as infantry was accepted by the Secretary of War, and it became temporarily a part of the First Division."

On June 14, 1917, the first expedition of American troops left the United States for France and the Fifth Regiment of Marines embarked on the naval transports *Henderson* and *Hancock*, and the auxiliary cruiser *De Kalb* (former *Prinz Eitel Friedrich*), formed approximately one-fifth of it. The fourth group, including the *Hancock*, did not sail until June 17, 1917.

The orders received by the convoy commander on the day prior to sailing read in part: "A military expedition is to be embarked on the above-named transports, augmented by a regiment of marines embarked in naval vessels, for transportation to a destination already communicated."

The *De Kalb* was in group 1, the *Henderson* in group 2, and the *Hancock* in group 4; all were part of the escort and not the convoy.

The *De Kalb* arrived at St. Nazaire, France, on June 26, 1917, the *Henderson* on June 27, and the *Hancock* on July 2. On June 27 the commanding officer of the Fifth Regiment reported to the commanding general, First Division, American Expeditionary Force, and from that date the Fifth Regiment was considered as being detached for service with the Army by direction of the President.

On June 27 the First Battalion, less the Fifteenth Company, which joined the battalion the following day, disembarked from the *De Kalb* and occupied quarters ashore. On this date Lieut. Col. Logan Feland joined the Fifth Regiment. On June 28 the Second and Third Battalions went ashore from the *Henderson* for a practice march, and the following day tents were erected for the regiment on a camp site a short distance outside of St. Nazaire. By 8 p. m. July 13, 1917, the entire Fifth Regiment was ashore under canvas.

On July 15, 1917, the Fifth Regiment, less the Third Battalion, which remained behind to perform guard duty, and other detached units and officers, proceeded to the Gondrecourt training area, and was stationed in Menaucourt and Naix.

On August 1 Gen. Pershing inspected the battalions at the two towns where they were billeted. On August 15 the First Division, including the Fifth Regiment of Marines, was reviewed by its commanding general on a plateau 12 miles distant from the training area.

On August 19 Gen. Pershing and Gen. Petain, commander in chief of all the French forces, inspected the marines as a unit of the First Division. Gen. Petain congratulated the colonel of the regiment on the splendid appearance of its officers and men, as well as the cleanliness of the towns.

Every opportunity was taken advantage of to perfect the regiment for combat duty, but this work was handicapped by the fact that many units of the regiment were scattered along the line of communications performing duty of a necessary but of a nontraining nature. One company and one battalion commander left the regiment on September 22, 1917, for duty in England, and did not rejoin the regiment until March 11, 1918. Many other officers and men were placed on detached duty.

On September 24 and 25, 1917, that part of the Fifth Regiment available for training arrived in the Bourmont training area and was stationed at Damblain and Breuvannes.

The following letter dated November 10, 1917, addressed by Gen. Pershing to the major general commandant, is both complimentary and explanatory as to why the marines were used along the line of communications:

"Your marines having been under my command for nearly six months, I feel that I can give you a discriminating report as to their excellent standing with their brothers of the Army and their general good conduct. I take this opportunity, also, of giving you the reasons for distributing them along our line of communications, which, besides being a compliment to their high state of discipline and excellent soldierly appearance, was the natural thing to do, as the Marine Regiment was an additional one in the division and not provided for in the way of transportation and fighting equipment in case the division should be pushed to the front. When, therefore, service of the rear troops and military and provost guards were needed at our base ports and in Paris it was the Marine Regiment that had to be scattered, in an endeavor to keep the rest of the organized division intact.

"I have been obliged to detach a number of your officers as assistant provost marshals in France and in England, all of which, I take it, you will agree with me was highly complimentary to both officers and men and was so intended. I can assure you that as soon as our service of the rear troops arrive, including a large number of officers and men for the specific duties now being performed by your men, the marines will be brought back once more under your brigade commander and assigned to the duties which they so much desire in the Second Regular Division under Gen. Bundy.

"It is a great pleasure to report on your fine representatives here in France."

Col. Charles A. Doyen was in command of the Fifth Regiment from the date of its organization on June 7, 1917, to October 29, 1917; and Lieut. Col. Hiram I. Bearss from October 30, 1917, to December 31, 1917. Col. Wendell C. Neville, having arrived on board the *De Kalb* at St. Nazaire, France, on December 28, 1917, reported to the Fourth Brigade for duty on January 1, 1918, and on that date assumed command of the Fifth Regiment, continuing in command until July, 1918.

The Sixth Machine Gun Battalion of Marines was organized at the Marine Barracks, Quantico, by order of the major general commandant on August 17, 1917. The battalion was designated the First Machine Gun Battalion, but on January 20, 1918, after arrival in France, was renamed the Sixth Machine Gun Battalion. On December 14, 1917, the battalion sailed from New York on the *De Kalb*, arriving at St. Nazaire, France, December 28. On January 3, 1918, the battalion arrived at Damblain in the Bourmont training area and began training with headquarters at Germain-Villiers.

Maj. Edward B. Cole was in command of the Sixth Machine Gun Battalion of Marines from the date of its organization until June 10, 1918, when he received a mortal wound.

On August 4, 1917, in accordance with directions issued by the President, the Secretary of the Navy directed the major general commandant "to organize a force of marines, to be known as the Sixth Regiment of Marines, for service with the Army in France," and the regiment was organized as directed.

On September 23, 1917, the First Battalion of the Sixth Regiment sailed on the *Henderson* from New York and landed at St. Nazaire, France, on October 5. On October 17 the Seventy-third Machine Gun Company, headquarters, and supply companies, and Col. Albertus W. Catlin, commanding officer of the Sixth Regiment, with his staff, sailed from Philadelphia, Pa., on the *De Kalb*, and from New York on October 18, arriving at St. Nazaire, France, on November 1. On October 31 the Third Battalion of the Sixth Regiment sailed from New York on board the *Von Steuben*, and anchored at Brest, France, on November 12, 1917. On January 24, 1918, the Second Battalion of the Sixth Regiment sailed on the *Henderson* from New York, and arrived at St. Nazaire February 6, 1918, and with the arrival of this last battalion the entire Sixth Regiment of Marines was in France.

On October 23, 1917, the Fourth Brigade of Marines was organized, with Brig. Gen. Charles A. Doyen in command. He continued in command until May 7, 1918.

On October 26, 1917, Brig. Gen. Doyen, United States Marine Corps, assumed command of the Second Division as its first commanding general, and announced his staff in General Orders, No. 1, with station at Bourmont, Haute-Marne, serving as such until relieved by Maj. Gen. Omar Bundy, United States Army, who assumed command November 8, 1917.

Like the Fifth Regiment, the Sixth Regiment spent several months performing the necessary but undesired duties along the line of communications. On January 12, 1918, Col. Albertus W. Catlin established headquarters for the Sixth Regiment at Blevaincourt, in the Bourmont training area. The Third Battalion arrived in this area on January 12, the headquarters units the same date, the First Battalion during January, 1918, and the Second Battalion on February 10, 1918.

Therefore, on February 10, the Fourth Brigade of Marines was in the Bourmont training area intact, with the exception of one company on duty in England, training industriously as an Infantry brigade of the Second Division. While the brigade had been organized on October 23, 1917, and had actually functioned as a brigade with elements of all three of its units present from January 12, 1918, it was not until February 10 that the brigade organization was perfected.

FIFTH BRIGADE OF MARINES.

On September 5, 1918, the major general commandant directed the post commander, Marine Barracks, Quantico, Va., to organize brigade headquarters of the Fifth Brigade, United States Marine Corps.

This brigade was accordingly organized and was composed of the Eleventh and Thirteenth Regiments and the Fifth Brigade Machine Gun Battalion. The companies of the Fifth Brigade were designated by letters and not by numbers.

Brig. Gen. Eli K. Cole was designated as the brigade commander, and on September 15, 1918, he and the brigade staff sailed from Hoboken, N. J., on board the *Von Steuben*, arriving at Brest, France, on September 24, 1918.

The Thirteenth Regiment left the overseas depot at Quantico, Va., on Friday, September 13, 1918, and on September 15, 1918, sailed from Hoboken, N. J., on board the *Henderson* and *Von Steuben*, arriving at Brest, France, on September 25, 1918.

On September 29, 1918, Eleventh Regiment, headquarters, and the First Battalion sailed on the *De Kalb* from Philadelphia, Pa., and arrived at Brest, France, on October 13, 1918. On October 16, 1918, the Second and Third Battalions of the Eleventh Regiment sailed from Brooklyn, N. Y., on board the *Agamemnon* and *Von Steuben*, and arrived at Brest, France, on October 25, 1918.

On October 28, 1918, the Fifth Brigade Machine Gun Battalion sailed from South Brooklyn, N. Y., on board the *Henderson*, and arrived at Brest, France, on November 9, 1918. With the arrival of this unit the entire Fifth Brigade was in France.

AVIATION UNITS.

On January 21, 1918, the First Marine Aeronautic Company arrived at naval base No. 13, Ponta Delgado, Azores.

On July 30, 1918, the First Marine Aviation Force (less Squadron D) disembarked at Brest, France, and formed the day wing of the northern bombing group. Squadron D joined the day wing in October, 1918.

MARINE DETACHMENTS FOR NAVAL BASES.

On January 21, 1918, and on July 20, 1918, detachments for the naval base No. 13 arrived at Ponta Delgado, Azores.

On September 30, 1918, the detachment for naval base No. 29 arrived at Cardiff, Wales.

On December 29, 1918, the detachment for the naval forces in France, staff office, Paris, France, landed at St. Nazaire, France.

REPLACEMENTS FOR AMERICAN EXPEDITIONARY FORCES.

The following table will show the names of the replacement organizations sent to the American Expeditionary Forces, dates of sailing and arrival, and names of vessels:

Name of organization.	Date embarked in United States.	Date disembarked in France.	Name of vessel.
Fifth Regiment Base detachment.....	July 31, 1917	Aug. 22, 1917	Henderson.
Twelfth and Twenty-sixth companies.....	Dec. 8, 1917	Dec. 31, 1917	De Kalb.
First Replacement Battalion.....	Feb. 5, 1918	Feb. 25, 1918	Von Steuben.
Second Replacement Battalion.....	Mar. 14, 1918	Mar. 27, 1918	Henderson.
Third Replacement Battalion.....	Apr. 22, 1918	May 7, 1918	Do.
Casual Company.....	do.	do.	Do.
First Machine Gun Replacement Battalion.....	May 26, 1918	June 8, 1918	Do.
First Casual Replacement Battalion.....	do.	do.	Do.
Second Casual Replacement Battalion.....	June 30, 1918	July 9, 1918	Do.
Third Separate Battalion.....	Aug. 13, 1918	Aug. 26, 1918	Do.
Fourth Separate Battalion.....	do.	do.	Do.
Fifth Separate Battalion.....	Aug. 17, 1918	Aug. 27, 1918	Von Steuben.
Sixth Separate Battalion.....	do.	do.	Do.
First Separate Machine-Gun Battalion.....	Aug. 21, 1918	Sept. 2, 1918	De Kalb.
Seventh Separate Battalion.....	Oct. 20, 1918	Nov. 3, 1918	Pocahontas.
Eighth Separate Battalion.....	do.	do.	Do.
Ninth Separate Battalion.....	Oct. 27, 1918	Nov. 9, 1918	Henderson.

In addition to the above the Twelfth Replacement Battalion sailed from the United States on board the *Hancock* in June, 1919, arrived in France in June, 1919, and joined the American Expeditionary Forces.

NUMBER OF MARINES SAILING FROM THE UNITED STATES TO EUROPE FOR DUTY WITH THE AMERICAN EXPEDITIONARY FORCES AND FOR SHORE DUTY WITH THE NAVAL SERVICE.

There were 834 officers, not including observers, and 30,481 enlisted men, or a total of 31,315 marines, sent overseas for shore duty with the American Expeditionary Forces and naval service. The following tables give details:

For duty with American Expeditionary Forces.

Month of departure from United States.	Officers.	Enlisted men.	Total.
May, 1917.....	12		2
June, 1917.....	70	2,689	2,759
July, 1917.....	29	1,054	1,083
September, 1917.....	27	1,045	1,072
October, 1917.....	45	1,536	1,581
December, 1917.....	23	637	660
January, 1918.....	31	1,031	1,062
February, 1918.....	24	1,041	1,065
March, 1918.....	23	1,034	1,057
April, 1918.....	22	1,284	1,306
May, 1918.....	24	1,565	1,589
June, 1918.....	6	751	757
August, 1918.....	32	4,362	4,394
September, 1918.....	172	5,275	5,447
October, 1918.....	132	5,809	5,941
Total.....	662	29,113	29,775

¹ Accompanied Gen. Pershing.

Sixty officers of the Medical Corps, 12 officers of the Dental Corps, 500 enlisted men of the Medical Corps, and 11 chaplains of the Navy, not included in the above figures, were sent to France and served with the Marines in the American Expeditionary Forces.

In addition to the above, the Twelfth Replacement Battalion, consisting of 9 officers and 500 enlisted men, joined the American Expeditionary Forces in June, 1919.

For duty with Naval Service ashore (Aviation personnel included).

Month of departure from United States.	Officers.	Enlisted men.	Total.
December, 1917.....	2	59	61
January, 1918.....	13	172	185
June, 1918.....	2	75	77
July, 1918.....	107	654	761
August, 1918.....	4	120	124
September, 1918.....	44	288	332
Total.....	172	1,368	1,540

OTHER OPERATIONS OF THE MARINES.

While the battle operations of the Fourth Brigade as an Infantry brigade of the Second Division of Regulars overshadowed all others taken part in by Marine Corps personnel, those operations were by no means the only ones participated in by officers and men of the Marine Corps.

The commanding general of the Second Division from early in August, 1918, to the date of demobilization, and several officers on his staff, were Marine officers. Officers of the Marine Corps were at various times attached to the First, Second, Third, Fourth, Sixth, Twenty-sixth, Thirty-second, Thirty-fifth, Ninetieth, and Ninety-second Divisions, and in some cases engaged in operations with them. Brig. Gen. John A. Lejeune assumed command of the Sixty-fourth Infantry Brigade of the Thirty-second Division then in the front line on the Swiss border in the Suarce sector, on July 5, 1918. He was in command of this brigade on July 22, 1918, when it was withdrawn from the above-mentioned sector, and continued in command until July 25, 1918, when he left to command the Fourth Brigade of Marines. Between July 5, 1918, and July 22, 1918, Brig. Gen. Lejeune, in addition to the Sixty-fourth Brigade, commanded three French Infantry regiments. Col. Robert H. Dunlap was in command of the Seventeenth Field Artillery Regiment of the Second Field Artillery Brigade, Second Division, from October 30, 1918, to February, 1919. Col. Hiram I. Bearss commanded the One hundred and second Regiment of the Fifty-first Infantry Brigade, Twenty-sixth Division, in the St. Mihiel offensive. Col. Frederic M. Wise commanded the Fifty-ninth Regiment of the Eighth Infantry Brigade, Fourth Division, from September 5, 1918, to January 4, 1919, during which period he participated in the St. Mihiel and Meuse-Argonne operations. From January 1, 1919, to February 9, 1919, Col. Wise commanded the Eighth Infantry Brigade of the Fourth Division.

A few marine officers and enlisted men engaged in Army aviation operations and suffered casualties. About 20 marine officers were sent to France as observers and as such participated in operations with American, French, and British forces. Marine aviation personnel served in France as the Day Wing of the Northern Bombing Group of the Navy. Marine flyers served with Squadrons 213 (pursuit squadron), 217, and 218 (bombing squadrons), Royal Flying Corps of England; and with pursuit, observation, and bombing squadrons of the French Flying Corps. Quite a few casualties were suffered by the marine aviation personnel.

The First Marine Aeronautic Company, naval base No. 13, Ponta Delgada, Azores, equipped for water flying only, performed patrol duty from January, 1918, until November 11, 1918.

The Marine Aviation Section, naval air station, Miami, Fla., performed patrol duties in the Florida Straits in connection with the Navy from July, 1918, until the date the armistice went into effect.

Marine detachments served on board all the American battleships attached to the British Grand Fleet and also on the American battleships which based

at Castletown Berehaven, Bantry Bay, Ireland. Marines also served on board many of the cruisers which escorted the vessels transporting Army troops to Europe. They were also attached to many other naval vessels such as the *Brooklyn*, *Helena*, and *Wilmington*, in China and Siberian waters, at one time landing at Vladivostok in conjunction with other naval forces; on the *Galveston* on the Murman Coast; and on the *Pittsburgh* in South American waters. Marines were also on the *San Diego* when that vessel was sunk, and the *Minnesota* when that ship was damaged by German mines. Marines were in intimate contact with the Germans in Guam and Philadelphia in conjunction with the Navy in the first hours of the war.

One brigade of marines was held in readiness in Texas for possible trouble in Mexico which might endanger the Allies' oil supply. Another was scattered throughout the island of Cuba. Large detachments of marines were stationed in the Azores and Virgin Islands in the nature of advanced base forces, while an advanced base force at Philadelphia was available at all times for naval needs.

Marine forces were also stationed in Guam, Philippine Islands, Peking, Pearl Harbor, and Nicaragua, and they assisted materially, under the limited conditions, in the war.

Active operations were conducted in Haiti and Santo Domingo against bandits during the period of the war by marine forces, the Haitian Gendarmerie, and the Guardia Nacional Dominicana, the two latter organizations being composed of natives and administered and officered by the marine and Navy personnel. Casualties were suffered by marines in the operations in Santo Domingo, 4 marines being killed, 13 wounded, and 1 officer wounded, between April 6, 1917, and November 11, 1918.

THE SECOND DIVISION OF REGULARS.

The first unit which ultimately formed a part of the Second Division arriving in France was the Fifth Regiment of Marines which landed in France with the first expedition of American troops in June, 1917. One marine lieutenant colonel, who afterwards was the first chief of staff of the Second Division, and another marine lieutenant colonel, who later commanded the Seventeenth Field Artillery of the Second Division, accompanied Gen. Pershing and his staff when they sailed from the United States late in May, 1917.

The Second Division was composed of the following units:

Third Infantry Brigade: Ninth Infantry, Twenty-third Infantry, Fifth Machine Gun Battalion.

Fourth Infantry Brigade: Fifth Marines, Sixth Marines, Sixth Machine Gun Battalion of marines.

Second Field Artillery Brigade: Twelfth Field Artillery, Fifteenth Field Artillery, Seventeenth Field Artillery, Second Trench Mortar Battery.

Other troops: Second Engineers, Fourth Machine Gun Battalion, First Field Signal Battalion, Second Headquarters Train and Military Police, Second Ammunition Train, Second Engineer Train, Second Supply Train, Second Sanitary Train.

On October 26, 1917, Brig. Gen. Charles A. Doyen, United States Marine Corps, assumed command of the Second Division as its first commanding general and announced his staff in General Orders, No. 1, with station at Bourmont, Haute-Marne, France. Lieut. Col. Logan Feland, United States Marine Corps, was the first chief of staff. On November 8, 1917, Maj. Gen. Omar Bundy, United States Army, assumed command, and was in command of it during the operations in the Verdun and Chateau-Thierry sectors. Maj. Gen. James G. Harbord, United States Army, commanded the division in the Aisne-Marne (Soissons) offensive in July, 1918. Maj. Gen. John A. Lejeune assumed command of the division on July 28, 1918, and retained command until its demobilization in August, 1919. Many marine officers occupied positions of importance and responsibility on the staff of the commanding general Second Division. A marine officer commanded the Seventeenth Field Artillery during the Meuse-Argonne offensive, and other marine officers commanded battalions of the Ninth Infantry and Fifteenth Field Artillery for a time.

The Fourth Brigade remained in the Bourmont training area, with headquarters at Damblain, until March 24, 1918, when it commenced movement into subsectors of the Verdun front, the first units of the brigade entering the front line during the night of March 16-17, 1918, with headquarters

at Toulon. On April 1, 1918, brigade headquarters was changed to Moscou. The brigade remained on the Verdun front until May 14, 1918, when it proceeded to an area around Vitry-le-Francois for open-warfare training, with headquarters at Venault-les-Dames. In the meantime, on May 6, 1918, Brig. Gen. James G. Harbord assumed command of the brigade, relieving Brig. Gen. Doyen, who had been ordered to the United States on account of his physical condition.

On May 14, 1918, the brigade left the area around Vitry-le-Francois, as it was unsuitable, and proceeded to an area around Gisors-Chaumont-en-Vixen, with headquarters at Bou-des-Bois. The brigade was in this area when sudden orders came to move to the Chateau-Thierry sector.

On May 27, 1918, Brig. Gen. John A. Lejeune and Maj. Earl H. Ellis sailed from New York on board the *Henderson*, and arrived at Brest, France, on June 8, 1918.

AISNE DEFENSIVE, HILL 142, BOURESCHES, AND BELLEAU WOOD.

In 1918, prior to the middle of July, the offensive was in the hands of the Germans, and between March 21, 1918, and July 15, 1918, the Germans directed no less than five major offensives against the allied lines in efforts to bring the war to a successful conclusion for the Central Powers. American troops assisted in breaking up every one of these drives, but the Second Division, including the marines, opposed only one—that in the Chateau-Thierry sector. On March 28, 1918, the American commander in chief placed all of the American forces at the disposal of Marshal Foch, who had been agreed upon as commander in chief of the allied armies, to be used as he might decide.

The first offensive (Somme) of the Germans was stopped within a few miles of Amiens, and the second (Lys) overran Armentieres. In this second German offensive, which lasted from April 9 to 27, 1918, and which has been designated by the Americans as a major operation, there were approximately 500 American troops engaged.

Late in May the Germans launched their third offensive, west of Rheims, crossed the Chemin-des-Dames, captured Soissons, and the last day of May found them marching in the direction of Paris down the Marne Valley. Again the American commander in chief placed every available man at the disposal of Marshal Foch. It was at this critical time, when the Allies were facing a grave crisis, that the Second Division, including the Marine Brigade, together with elements of the Third and Twenty-eighth Divisions, were thrown into the line and, in blocking the German advance in the Chateau-Thierry sector, rendered great assistance in stopping the most dangerous of the German drives.

The first report of the American commander in chief states that "the Third Division, which had just come from its preliminary training area, was hurried to the Marne. Its motorized machine-gun battalion preceded the other units and successfully held the bridgehead at the Marne opposite Chateau-Thierry. The Second Division, in reserve near Montdidier, was sent by motor trucks and other available transport to check the progress of the enemy toward Paris."

The final report of the American commander in chief with reference to this third German offensive stated in part:

"On reaching the Marne that river was used as a defensive flank and the German advance was directed toward Paris. During the first days of June something akin to a panic seized the city and it was estimated that 1,000,000 people left during the spring of 1918."

The Second Division, then in reserve northwest of Paris and preparing to relieve the First Division, was hastily diverted to the vicinity of Meaux on May 31, and, early on the morning of June 1, was deployed across the Chateau-Thierry-Paris road near Montreuil aux-Lions in a gap in the French line, where it stopped the German advance on Paris.

The fighting of the Second Division in the Chateau-Thierry sector was divided into two parts, one a stubborn defensive lasting a week and the other a rigorous offensive. The defensive fighting of the Second Division between May 31 and June 5, 1918, was part of the major operation called by the Americans the Aisne defensive.

The close of the Aisne defensive on June 5 found the line of the Second Division well established at that point of the Marne salient nearest Paris, but

not including Hill 142, Bois de Belleau, Boursches, or Vaux, and the Germans were in possession of Chateau-Thierry on the right of the Second Division, and continued to hold that town until about July 17.

On June 6, 1918, the Second Division wrested the initiative from the Germans, and started an offensive on its front which did not end until July 1. The Marine Brigade captured Hill 142 and Boursches on June 6, 1918, and, in the words of Gen. Pershing, "Sturdily held its ground against the enemy's best guard division," and completely cleared the Bois de Belleau of the enemy on June 26, 1918, a major of marines sending in his famous message: "Woods now United States Marine Corps' entirely." The American commander in chief in his first reports calls this fighting "the Battle of Belleau Woods," and states, "Our men proved their superiority, and gained a strong tactical position with far greater loss to the enemy than to ourselves." In his final report he stated: "The enemy having been halted, the Second Division commenced a series of vigorous attacks on June 4, which resulted in the capture of Belleau Woods (on June 26), after very severe fighting. The village of Boursches was taken soon after (on June 6), and on July 1 Vaux was captured. In these operations the Second Division met with most desperate resistance by Germany's best troops." On July 1, 1918, the Third Brigade captured Vaux. The Artillery Engineers, and the other elements of the Second Division assisted materially in these successes, while the Seventh Regiment of the Third Division was in Belleau Woods for a few days about the middle of June.

During these 31 days of constant fighting, the last 26 of which has been defined by general headquarters of the American Expeditionary Forces as a "local engagement," the Second Division suffered 1,811 battle deaths of which approximately 1,062 were marines, and suffered additional casualties amounting to 7,252 (of which approximately 3,615 were marines).

The achievements of the Fourth Brigade of Marines in the Chateau-Thierry sector was twice recognized by the French. The first, which changed the name of the Bois de Belleau, was a tribute spontaneously made to the successes and to the losses of the Fourth Brigade of Marines. Belleau Woods and other nearby positions were taken from the Germans and had a beneficial effect on the feelings of the French and the morale of the Allies. Official maps were immediately modified to conform with the provisions of the order, the plan directeur used in later operations bearing the name "Bois de la Brigade de Marine." The French also used this new name in their orders, as illustrated by an *ordre général*, dated August 9, 1918, signed by the commanding general of the Sixth French Army.

The second recognition by the French of the marines' work in the Chateau-Thierry sector were citations of the Fourth Brigade, Fifth and Sixth Regiments, and the Sixth Machine Gun Battalion of Marines in French army orders.

French civilian sentiment expressed itself in a letter from the mayor of Meaux and a resolution from the assembled mayors of the Meaux district (*arrondissement*). This letter and the resolutions were published on July 10, 1918, in General Orders No. 43, of the Second Division "as indicating the appreciation of the efforts of the Second Division by the French inhabitants for our share in stemming the recent German advance in this sector." This letter said:

"The civilian population of this part of the country will never forget that the beginning of this month of June, when their homes were threatened by the invader, the Second American Division victoriously stepped forth and succeeded in saving them from impending danger."

During the first attack on Belleau Wood on June 6, 1918, Col. Albertus W. Catlin was severely wounded and was relieved in command of the Sixth Regiment by Lieut. Col. Harry Lee, who continued in command until the regiment was demobilized in August, 1919.

When Maj. Edward B. Cole was mortally wounded, on June 10, 1918, he was relieved in command of the Sixth Machine Gun Battalion of marines by Capt. Harlan E. Major. On June 11, 1918, Capt. Major was relieved by Capt. George H. Osterhout, who retained command until relieved by Maj. Littleton W. T. Waller, jr., on June 21, 1918.

During the fighting in the Chateau-Thierry sector the headquarters of the Fourth Brigade was successively at Montreuil-aux-Lions (in an automobile for one-half hour on the way to the front lines), Issonge farmhouse, and La Loge farmhouse. After being relieved by elements of the Twenty-sixth Division during the night of July 5-6, 1918, the brigade moved to an area in rear of the lines and occupied what was known as the line of defense, or Army line, with

headquarters at Nanteuil sur-Marne. The brigade remained there until July 16, 1918.

During the time the above-described fighting was going on the Germans were frustrated in their fourth 1918 drive (Noyon-Montdidier defensive), between June 9 and 15, 1918; and, of course, being busy in the vicinity of Bois de Belleau, the marines had no opportunity of engaging in it.

Having been blocked in the Marne salient, the Germans attacked, for the fifth time in 1918, on July 15; and, as events turned out, it was the last, for from the time of its failure they were on the defensive. The allied troops, including many Americans, held this attack, called by the Americans the Champagne-Marne defensive, which was on a large scale, and the grand initiative passed from the Germans to the Allies on July 18, 1918, when Marshal Foch launched his initial major offensive, termed by the Americans the Aisne-Marne. In this operation the marine brigade and other elements of the Second Division took part in the vicinity of Soissons.

THE AISNE-MARNE OFFENSIVE (SOISSONS).

On July 11, 1918, Brig. Gen. James G. Harbord, commanding general of the marine brigade, received notification of his appointment as a major general, and two days later left on a five days' leave of absence. As Col. Neville had been evacuated to a base hospital after leaving the Chateau-Thierry sector, Lieut. Col. Harry Lee assumed temporary command of the brigade. Maj. Gen. Harbord and Col. Neville both returned in time to enter the Aisne-Marne offensive, the former in command of the Second Division and the latter in command of the Fourth Brigade.

Of the six allied offensives taking place in 1918 on the western front, designated by the Americans as major operations, the Fourth Brigade of Marines, with the other units of the Second Division, participated in three, the first being the vast offensive known as the Aisne-Marne, in which the Marine Brigade entered the line near Soissons.

On July 17, 1918, the First Moroccan Division and the First and Second Divisions of American Regulars were hurriedly and secretly concentrated, by terribly fatiguing forced night marches over roads jammed with troops, artillery, and tanks, through rain and mud, in the Bois de Retz, near Soissons. Headquarters of the Fourth Brigade was established at Vivieres.

Early on the morning of July 18, 1918, Marshal Foch threw these three picked divisions at the unsuspecting Germans with overwhelming success, and again on the following day. The American commander in chief in his first report stated:

"The place of honor in the thrust toward Soissons on July 18 was given to our First and Second Divisions, in company with chosen French divisions. Without the usual brief warning of a preliminary bombardment, the massed French and American artillery, firing by the map, laid down its rolling barrage at dawn while the Infantry began its charge. The tactical handling of our troops under these trying conditions was excellent throughout the action. The Second Division took Beaurepaire farm and Vierzy in a very rapid advance and reached a position in front of Tigny at the end of its second day."

In his final report he stated:

"Gen. Petain's initial plan for the counterattack involved the entire western face of the Marne salient. The First and Second American Divisions, with the First French Moroccan Division between them, were employed as the spearhead of the main attack, driving directly eastward through the most sensitive portion of the German lines to the heights south of Soissons. The advance began on July 18, without the usual brief warning of a preliminary bombardment, and these three divisions at a single bound broke through the enemy's infantry defenses and overran his artillery, cutting or interrupting the German communications leading into the salient. A general withdrawal from the Marne was immediately begun by the enemy, who still fought stubbornly to prevent disaster.

"The Second Division advanced 8 kilometers in the first 26 hours, and by the end of the second day were facing Tigny, having captured 3,000 prisoners and 66 field guns. It was relieved the night of the 19th by a French division. The result of this counteroffensive was of decided importance. Due to the magnificent dash and power displayed on the field of Soissons by our First and Second Divisions, the tide of war was definitely turned in favor of the Allies."

Maj. Gen. James G. Harbord, commanding the Second Division in this operation, describes the two days' fighting of his division in these words:

"It is with keen pride that the division commander transmits to the command the congratulations and affectionate personal greetings of Gen. Pershing, who visited the division headquarters last night. His praise of the gallant work of the division on the 18th and 19th is echoed by the French high command, the Third Corps commander, American Expeditionary Forces, and in a telegram from the former division commander. In spite of two sleepless nights, long marches through rain and mud, and the discomforts of hunger and thirst, the division attacked side by side with the gallant First Moroccan Division and maintained itself with credit. You advanced over six miles, captured over 3,000 prisoners, 11 batteries of artillery, over 100 machine guns, minnenwerfers, and supplies. The Second Division has sustained the best traditions of the Regular Army and the Marine Corps. The story of your achievements will be told in millions of homes in all allied lands to-night."

This was one of the greatest strategical successes of Marshal Foch, and that the part played by the marines was appreciated by the French is illustrated by the Fifth and Sixth Regiments and the Sixth Machine Gun Battalion being cited in French Army orders.

Following the advance of the first day, brigade headquarters was moved forward to a cave in Vierzy.

Col. Logan Feland was in command of the Fifth Regiment during the Aisne-Marne offensive, near Soissons, and continued in command of it with the exception of two days in July, 1918 (when Brig. Gen. Lejeune commanded the Fourth Brigade and Col. Neville the Fifth Regiment), until March 21, 1919, when he was relieved by Col. Harold C. Snyder, who retained command until the date of demobilization.

The Fourth Brigade was relieved about midnight July 19, 1918, and after remaining in a reserve position until July 22, 1918, marched to an area farther in the rear, but still in a reserve position, brigade headquarters being established at Taillefontaine. After final relief from this active sector the brigade was billeted July 24-25, 1918, in an area around Nanteuill-le-Haudouin, brigade headquarters being established at Nanteuill. The brigade remained in this area until July 31, 1918.

On July 25, 1918, Brig. Gen. John A. Lejeune arrived, and assumed command of the Fourth Brigade on July 26, 1918, General Orders, No. 16, reading as follows:

"I have this day assumed command of the Fourth Brigade, United States Marines.

"To command this brigade is the highest honor that could come to any man. Its renown is imperishable, and the skill, endurance, and valor of the officers and men have immortalized its name and that of the Marine Corps."

Brig. Gen. Lejeune retained command until July 29, 1918, when he became commanding general of the Second Division, relieving Maj. Gen. Harbord, who left to assume command of the Services of Supply. Col. Neville, on this latter date, resumed command of the Fourth Brigade.

MARBACHE SECTOR, NEAR PONT-A-MOUSSON—ST. MIHIEL OFFENSIVE.

During the last two days of July, 1918, the units of the brigade entrained for a 24-hour railroad journey which took them to an area around Nancy, with headquarters at Villers-les-Nancy, where they remained resting and refitting until August 9, 1918.

On August 7, 1918, information was received of the promotion of Brig. Gen. Lejeune to the grade of major general, and of Col. Neville to the grade of brigadier general, both to date from July 1, 1918.

Col. Albertus W. Catlin arrived in the United States on board the *America* on August 3, 1918. Col. Catlin, having been wounded on June 6, 1918, during the first attack on Bois de Belleau, was admitted to Hospital No. 2, Paris, France, on the next day, was discharged on July 22, 1918, granted two months' sick leave, and sailed for New York from Brest, France, on July 25, 1918.

On August 5, 1918, movement of units of the brigade was started for the occupation of the Marbache subsector, near Pont-a-Mousson, on the Moselle River. By August 8, 1918, the movement was completed, with headquarters established at Scarponne, just across the Moselle River from Dieulouard. The sector was quiet and occupation uneventful, except for an enemy raid which was successfully repulsed and prisoners captured.

On August 8, 1918, Lieut. Col. Earl H. Ellis was appointed adjutant of the Fourth Brigade, relieving Lieut. Col. Harry R. Lay, who had been detailed as inspector general of the Second Division.

The relief from the Marbache Sector was completed on August 18, 1918, and the brigade moved to an area about 20 kilometers southeast of Toul, headquarters being established at Favieres. Intensive training for the impending St. Mihiel offensive was indulged in here.

The brigade started to move from this area on the night of September 2, 1918, and after a series of night marches, during which time headquarters were established at Pont St. Vincent, Velaine-en-Haye, and Bouvron, the brigade arrived just outside of Manonville, headquarters being established in Manonville. From September 12 to 16, 1918, the brigade was engaged in the St. Mihiel offensive in the vicinity of Remenauville, Thiaucourt, Xammes, and Jaulny as a unit of the Second Division of the First Corps of the First Army. Headquarters during these operations were successively at 1 kilometer north of Lironville, Thiaucourt, and finally at Manonville, on September 16, 1918.

On September 20, 1918, the brigade moved to an area south of Toul, with headquarters at Chaudenay. The brigade remained in this area until September 25, 1918, when it moved by rail to an area south of Chalons-sur-Marne, with headquarters at Sarry.

THE CHAMPAGNE—BATTLE OF BLANC MONT RIDGE—CAPTURE OF ETIENNE—MARCH TO LEFFINCOURT.

Marshal Foch, having asked for an American division to assist in breaking through the powerful German defenses in the Champagne, the Second Division, including the Marine Brigade, was temporarily placed at the disposal of the Fourth French Army under Gen. Gouraud from September 27, 1918, to October 10, 1918. At first it was directly subject to the orders of Marshal Petain, but before the actual fighting began it was placed directly under the orders of Gen. Gouraud.

On September 28, 1918, the Fourth Brigade moved by bus and marching to the Souain-Sulppes area, with brigade headquarters at Sulppes.

On October 1, 1918, in an order of the Second Division, the commanding general of the Second Division encouraged his division with the following words:

"1. The greatest battles in the world's history are now being fought. The Allies are attacking successfully on all fronts. The valiant Belgian Army has surprised and defeated the enemy in Flanders; the English, who have been attacking the enemy without ceasing since August 8, have advanced beyond the Hindenburg line, between Cambria and St. Quentin, capturing thousands of prisoners and hundreds of cannon; the heroic allied army of the Orient has decisively defeated the Bulgars; the British have captured over 50,000 prisoners in Palestine and have inflicted a mortal blow on the Turk; and our own First Army and the Fourth French Army have already gained much success in the preliminary stages of their attack between the Meuse and Sulppes Rivers.

"2. Owing to its world-wide reputation for skill and valor, the Second Division was selected by the commander in chief of the allied armies as his special reserve, and has been held in readiness to strike a swift and powerful blow at the vital point of the enemy's line. The hour to move forward has now come, and I am confident that our division will pierce the enemy's line, and once more gloriously defeat the Hun."

The battle of Blanc Mont Ridge was one of the most powerful and effective blows struck under the direction of Marshal Foch against the retreating Germans, and its brilliantly successful conclusion was due in a great degree to the military genius of Maj. Gen. John A. Lejeune of the Marines.

On September 27, 1918, Maj. Gen. John A. Lejeune called on Gen. Gouraud at the headquarters of the Fourth French Army, who explained the situation at the front to him. Facing a large relief map of the battlefield, Gen. Gouraud placed his hand on the Blanc Mont Ridge and said: "General, this position is the key of all the German defenses of this sector including the whole Rheims Massif. If this ridge can be taken the Germans will be obliged to retreat along the whole front 30 kilometers to the river Aisne. Do you think your division could effect its capture?" Maj. Gen. Lejeune responded that he felt certain the Second Division could take the stronghold pointed out, whereupon he was informed that he would be ordered to make the attack within a few days and was directed to prepare a plan for the assault.

At this time the Second Division was directly subject to the orders of Marshal Petain, but later in the day Gen. Gouraud informed Maj. Gen. Lejeune that after an explanation of the circumstances Marshal Petain had assigned the division to the Fourth French Army.

The general plan provided for an attack by the whole Fourth French Army between the Argonne and the Suipees River.

On October 1, 1918, the brigade with the rest of the Second Division marched to the front line near Somme-Py on the night of October 1-2, 1918, and relieved elements of a French division. The brigade headquarters was located in the trenches about 2½ kilometers south of Somme-Py. The relief was effected before daylight without incident.

The Battle of Blanc Mont Ridge was fought and won by the Second Division, as a unit of the Fourth French Army, between October 3 and 9, 1918, over the desolate chalky ground of the Champagne, which was scarred and shell pocked by years of artillery fire, marked with huge mine craters, grid-ironed with an intricate maze of deep trenches and concrete fortifications, and covered with tangled masses of wire.

The overwhelming success and the far-reaching effect of the Second Divisions' part in these operations, the cleaning up of the Esscu Hook, the capture of Blanc Mont Ridge, and the capture of St. Etienne, are described in general terms in official publications.

That the plan was as brilliantly executed as it was daringly conceived is shown by this extract from an order of the Second Division, dated November 11, 1918, reading in part as follows:

"In the Champagne district, October 2 to 10, it fought beside the Fourth French Army. On October 3 it seized Blanc Mont Ridge, the keystone of the arch of the main German position, advanced beyond the ridge and, although both flanks were unsupported, it held all its gains with the utmost tenacity, inflicting tremendous losses on the enemy. This victory freed Rheims and forced the entire German Army between that city and the Argonne Forest to retreat to the Aisne, a distance of 30 kilometers."

The amazing success of the attack and the vital effect of the capture of Blanc Mont Ridge and St. Etienne is described in the words of Gen. Couraud himself in a letter to Marshal Foch, reading in part as follows:

"Because of the brilliant part played by this 'grand unit' in the offensive of the Fourth Army during the autumn of 1918, I propose the Second American Division for a citation in 'The Order of the Army' upon the following specific grounds:

"The Second Infantry Division, United States, brilliantly commanded by Gen. Lejeune, played a glorious part in the operations of the Fourth Army in the Champagne in October, 1918. On the 3d of October this division drove forward and seized in a single assault the strongly entrenched German positions between Blanc Mont and Medeah Ferme, and again pressing forward to the outskirts of Saint Etienne-a-Arnes it made in the course of the day an advance of about 6 kilometers.

"It captured several thousand prisoners, many cannon, and machine guns, and a large quantity of other military matériel. This attack, combined with that of the French divisions on its left and right, resulted in the evacuation by the enemy of his positions on both sides of the river Suipee and his withdrawal from the Massif de Notre-Dame-des-Champs."

The further opinion of the French as to the results and effect of the Second Division's operations in Champagne is set forth in the following-quoted extract from Information Bulletin No. 12 of the Fourth French Army dated October 7, 1918:

"Up to October 4, at which date the present bulletin is written, the Fourth Army has pushed its advance up to objectives of the very highest importance. A splendid American division, full of dash and ardor, the Second Division, United States, placed at the disposition of the Twenty-first Corps on October 3, made itself master of Massif du Blanc Mont, which dominates the valley of the Arnes and gives us excellent outlook on the valley of the Suipee in rear of the region of Monts. This conquest rapidly brought about the downfall of Notre-dame-des-Champs and the Grand Bois de Saint Souplet."

The American commander in chief in his first report describes the Battle of Blanc Mont in the following words:

"The Second Division conquered the complicated defense works on their front against a persistent defense worthy of the grimmest period of trench warfare and attacked the strongly held wooded hill of Blanc Mont, which they

captured in a second assault, sweeping over it with consummate dash and skill. This division then repulsed strong counterattacks before the village and cemetery of St. Etienne and took the town, forcing the Germans to fall back from Rheims and yield positions they had held since September, 1914."

On October 10, 1918, having been relieved from the line in the Blanc Mont sector, the brigade took station in the Sulpess-Somme Sulpess-Nantivet area and the adjacent camps with headquarters at Sulpess, being assigned as Fourth French Army reserve. The brigade remained in this area resting and refitting until October 14, 1918, when, in accordance with orders, it marched to the Vadenay-Bouy-la-Veuve-Dampierre area,* north of Chalons-sur-Marne, with headquarters at Bouy. While here orders were received placing the Fourth Brigade provisionally at the disposal of the Ninth French Army Corps to hold a sector in the region Attigny-Voncq-Aisne River.

Accordingly on October 20, 1918, the brigade was temporarily detached from the Second Division and marched to the area Sulpess-Nantivet-Somme-Sulpess, with headquarters at Sulpess. On October 21, 1918, in obedience to orders, the Marines hiked to the vicinity of Leflincourt, where brigade headquarters was established. While about to take over the assigned sector the Fourth Brigade received orders to rejoin the Second Division, which was preparing to enter the Meuse-Argonne offensive. After a hard march these orders were obeyed and brigade headquarters established at Mont Peller on October 23, 1918.

On October 24, 1918, Maj. Matthew W. Kingman relieved Maj. Littleton W. T. Waller, Jr., in command of the Sixth Machine Gun Battalion of Marines, Maj. Waller joining the Second Division staff as division machine-gun officer.

THE MEUSE-ARGONNE OFFENSIVE—CROSSING THE MEUSE RIVER.

On October 25, 1918, the brigade moved to the Les Islettes area, with brigade headquarters at Camp Cabaud. On the evening of October 26 it arrived in the area south of Exermont and bivouacked in the woods there that night, with brigade headquarters at Exermont. The brigade remained in bivouac in this area until the night of October 30-31, when it moved forward into line to participate in the immense Meuse-Argonne offensive, which had started on September 26, the Second Division being assigned as a unit of the Fifth Corps.

Relieving elements of the Forty-second Division, just south of Londres et St. Georges, the marine brigade early on the morning of November 1 jumped off, following a terrific barrage, for its final operation of the war, the conclusion of which at 11 o'clock on the morning of November 11, 1918, found the marines firmly established on the heights of the far bank of the Meuse River after an advance of 30 kilometers.

The splendid work of the Second Division, including the marines, is described in official reports, and excerpts from some are given below.

In recommending that the Second Division be cited in General Headquarters Orders for its excellent work in the attack of November 1-11, 1918, the commanding general First Army wrote on January 16, 1919, in part as follows:

"4. In the First Army attack of November 1, 1918, the Second Division was selected and so placed in the battle line that its known ability might be used to overcome the critical part of the enemy's defense. The salient feature of the plan of attack was to drive a wedge through Landres et St. Georges to the vicinity of Fosse. It was realized that if the foregoing could be accomplished the backbone of the hostile resistance west of the Meuse would be broken, and the enemy would have to retreat to the east of the Meuse. Success in this plan would immediately loosen the flanks of the First Army. The Second Division was selected to carry out this main blow.

"5. The Second Division accomplished the results desired in every particular on the first day of the attack, not only clearing the hostile defenses of Landres et St. Georges and the Bois de Hazols but continuing its advance to the vicinity of Fosse; i. e., about 9 kilometers. This decisive blow broke enemy's defense and opened the way for the rapid advance of the Army."

With reference to the first day's attack, the commanding general, Fifth Army Corps, wrote officially on November 2, 1918, in part as follows:

"The division's brilliant advance of more than 9 kilometers, destroying the last stronghold on the Hindenburg line, capturing the Freya Stellung, and going more than 9 kilometers against not only the permanent but the relieving forces in their front, may justly be regarded as one of the most remarkable achievements made by any troops in this war. For the first time, perhaps, in our experience the losses inflicted by your division upon the enemy in the offensive

greatly exceeded the casualties of the division. The reports indicate moreover that in a single day the division has captured more artillery and machine guns than usually falls to the lot of a command during several days of hard fighting. These results must be attributed to the great dash and speed of the troops, and to the irresistible force with which they struck and overcame the enemy."

The following citation in Fifth Army Corps, General Orders No. 26, dated November 20, 1918, gives a further description of these operations:

"The Second Division, in line at the launching of the attack, broke through the strong enemy resistance, and, leading the advance, drove forward in a fast and determined pursuit of the enemy, who, despite new divisions hastily thrown in, was driven back everywhere on its front. This division drove the enemy across the Meuse, and under heavy fire against stubborn resistance, built bridges and established itself on the heights. The cessation of hostilities found this division holding strong positions across the Meuse and ready for a continuation of the advance."

An order of the Second Division, dated November 5, 1918, reading in part as follows, tells what occurred subsequent to the first day's attack:

"During the night of November 2-3 the Second Division moved forward overcoming the resistance of the enemy's advanced elements, and, at 6 a. m., it attacked and seized the enemy's line of defense on the ridge southeast of Vaux-en-Dieulet.

"Late in the afternoon, the enemy, having reorganized his line on the border of Belval Forest, was again attacked and defeated. After nightfall, and in a heavy rain, the advanced elements of the division pressed forward through the forest and occupied a position on the heights south of Beaumont, 8 kilometers in advance of the divisions on our right and left.

"During the night of November 4-5 the division again pressed forward, occupied Beaumont and Letanne and threw the enemy on its front across the Meuse."

An order of the Second Division, dated November 12, 1918, describing the historic crossing of the Meuse River on the night before the armistice became operative, reads as follows:

"1. On the night of November 10 heroic deeds were done by heroic men. In the face of a heavy artillery and withering machine-gun fire, the Second Engineers threw two foot bridges across the Meuse and the first and second battalions of the Fifth Marines crossed resolutely and unflinchingly to the east bank and carried out their mission.

"2. In the last battle of the war, as in all others in which this division has participated, it enforced its will on the enemy."

The general success achieved by the Second Division in the Argonne-Meuse offensive is well described by the words of the order citing Maj. Gen. John A. Lejeune, of the marines, for an Army distinguished service medal, reading in part as follows:

"In the Meuse-Argonne offensive his division was directed with such sound judgment and ability that it broke and held, by the vigor and rapidity of execution of its attack, enemy lines which had hitherto been considered impregnable."

During this fighting the headquarters of the Fourth Brigade was successively established at Exermont, one-half kilometer north of Exermont, Sommerance, Bayonville-et-Chennery, Fosse, Belval-Bois-des-Dames, and Beaumont.

The following self-explanatory memorandum was sent out by the commanding general of the Fourth Brigade:

HEADQUARTERS FOURTH BRIGADE,
MARINES, AMERICAN EXPEDITIONARY FORCES,
November 11, 1918—9.10 a. m.

Peace memorandum No. 1.

The following telephone message received from Surprise 1 at 8.35 a. m. this morning forwarded for compliance:

8.40 a. m. message from Fifth Corps: Armistice signed and takes effect at 11 this morning. Accurate map showing locations of front-line elements, including patrols and detachments, will be sent to these headquarters without delay.

On "the eleventh hour, the eleventh day of the eleventh month, of the year 1918," Brig. Gen. Wendell C. Neville, commanding general of the Fourth Brigade of Marines, published the following tribute to the officers and men of the Fourth Brigade:

"Upon this, the most momentous hour in the history of the World War, the undersigned wishes to express to his command his sincere appreciation of their unflinching devotion to duty and their heroic and courageous action during the recent operations.

"The time, when the results of our efforts during the past year are shown, is here. The hour has arrived when the convulsion which has shaken the foundations of the civilized world has ceased. The enemy is defeated and the principles of freedom and democracy have triumphed over barbarism and autocracy. We may all feel justly proud of the extent of our participation which has forced the enemy to a cessation of hostilities. It is fitting, at this time, to think of those of our comrades who have fallen on the field of honor and rejoice in the fact that they did not give their lives in vain.

"Your display of fortitude, determination, courage, and your ability to fight has upon more than one occasion been a determining factor in making history, and your work has had a direct bearing upon the remarkable chain of events which have this day culminated in such a satisfactory manner. Along the fronts of Verdun, the Marne, the Aisne, Lorraine, Champagne, and the Argonne, the units of the Fourth Brigade Marines have fought valiantly, bravely, and decisively. They have nobly sustained the sacred traditions and have added glorious pages to the already illustrious history of the United States Marine Corps. It is a record of which you may all be proud."

MARCH TO THE RHINE—ARMY OF OCCUPATION.

On November 17, 1918, the Second Division commenced its march to the Rhine, passing through Belgium and Luxembourg. The German frontier was reached November 25, 1918, crossed on December 1, 1918, the Rhine reached December 10, 1918, and crossed on December 13, 1918. During this march and up to the time the Fourth Brigade settled down to its occupation duty in Germany, brigade headquarters were successively established at Margut, Bellefontaine, Arlon, Usseldange, Berg, Eppeldorf, Neuerburgh, Waxweiler, Prum, Budeshelm, Wiesbaum, Antweiler, Neuenahr, Burghbrohl, Rheinbrohl, and Honningen.

WITH THE ARMY OF OCCUPATION.

The duties of the Fourth Brigade with the Army of Occupation in Germany were uneventful, the outstanding features being the establishment of a Rhine River patrol, manned and commanded by Marines; an extended visit, inspection, and review by the Secretary of the Navy; and the operation of the Second Division, including the marines, made about the middle of June, 1919, in which an advanced position was taken as a part of the concentration of the Third Army immediately preceding the signing of the treaty of peace by the Germans.

Headquarters of the Fourth Brigade during the greater part of the occupation of Germany was at Nieder Bleber, while during the last operation when the advanced position was taken, just prior to Germany signing the peace treaty, it was at Herschbach. On the date the treaty was signed the Fifth Regiment, with headquarters at Hatenfels, occupied the most advanced position ever occupied by marines in Germany.

Just before departing from Germany headquarters was at Nieder Bleber, and with the exception of Brest, France, this was the last headquarters the brigade had in Europe.

Maj. Charles D. Barrett relieved Lieut. Col. Earl H. Ellis as brigade adjutant in April, 1919, and held that position until the brigade was demobilized. Lieut. Col. Ellis was assigned to duty as second in command of the Fifth Regiment. On March 12, 1919, Col. Logan Feland was temporarily appointed brigadier general to rank from March 9, 1919, and accepted appointment and executed oath on March 17, 1919. On March 21, 1919, Col. Harold C. Snyder assumed command of the Fifth Regiment, relieving Brig. Gen. Logan Feland, who, after acting as aid for the Secretary of the Navy, arrived in the United States on the *Von Steuben* on May 13, 1919.

Just before the Second Division left Germany the commanding general of the Army of Occupation expressed his appreciation of the services of that division in a letter dated July 2, 1919, which is published in General Orders, Second Division, No. 68, July 5, 1919:

"As your magnificent division is about to leave his command, it is with a sense of gratitude for its splendid achievements while in the American Expeditionary

Forces that the Army commander expresses to you and to your gallant officers and men his appreciation of your services.

"After occupying a defensive sector between Verdun and St. Mihiel, you were placed in the line of battle and met, with stubborn resistance, the onslaughts of the enemy's hordes near Chateau-Thierry. Your action at Belleau Woods and your attacks upon and capture of Vaux must ever remain brilliant exploits in our military history.

"At Soissons, side by side with a veteran French division, you proved to our allies the fighting value of the Army of the United States, and at St. Mihiel, in the first great American offensive, your prowess in attack was irresistible.

"When in October, 1918, the Allied High Command desired to reinforce the French Army by American troops of great offensive worth, by real 'shock troops,' you were loaned to Gen. Gouraud's Fourth French Army and delivered your famous assault on Blanc Mont Ridge, releasing from German menace the historic city of Rheims.

"In the closing phase of the Meuse-Argonne operations, certainly no troops contributed more to the enemy's destruction than your division. After taking Landres-et-St. Georges, Bayonville-et-Chennery, and the Bois-de-la-Folie, you pierced the Bois-de-Belval, and by skillful night fighting and marching you cleared the enemy from the left bank of the Meuse and forced a crossing of the river.

"Your brilliant exploits in battle are paralleled by the splendid example of soldierly bearing and discipline set by your officers and men while a part of the Army of Occupation. That spirit and dash which carried your men through the enemy's defenses still predominated when the Army was recently concentrated, preparatory to a further advance into unoccupied Germany.

"Officers and soldiers of the Second Division, your achievements and sacrifices have earned for you and for your fallen comrades the praise and gratitude of our Nation."

A SUMMARY OF THE OPERATIONS OF THE FOURTH BRIGADE.

A summary of the operations of the Fourth Brigade of Marines is set forth below:

The Fourth Brigade of Marines as a unit of the Second Division participated in actual battle in France in the following sectors between the inclusive dates set down (as published in General Orders, No. 37, Second Division, April 25, 1919):

"Toulon sector, Verdun: From March 15 to May 13, 1918.

"Aisne defensive, in the Chateau-Thierry sector: From May 31 to June 5, 1918.

"Chateau-Thierry sector (capture of Hill 142, Bouresches, Belleau Wood): From June 6 to July 9, 1918.

"Aisne-Marne (Soissons) offensive: From July 18 to July 19, 1918.

"Marbache sector, near Pont-a-Mousson on the Moselle River: From August 9 to August 16, 1918.

"St. Mihiel offensive, in the vicinity of Thiaucourt, Xammes, and Jaulny: From September 12 to September 16, 1918.

"Meuse-Argonne (Champagne) including the capture of Blanc Mont Ridge and St. Etienne: From October 1 to October 10, 1918.

"Meuse-Argonne (including crossing of the Meuse River): From November 1 to November 11, 1918."

WITH THE NAVY ON BOARD BATTLESHIPS AND CRUISERS.

Marines served on board the battleships of division 9 of the Atlantic Fleet, composed of the *New York* (flagship), *Wyoming*, *Florida*, and *Delaware*, which served for a year with the British Grand Fleet; and of division 6, which was stationed at Bantry Bay, Ireland, as well as on other ships of the Atlantic, Pacific, and Asiatic fleets.

PARTICIPATED IN OPERATIONS AT VLADIVOSTOK.

The Marines of the *Brooklyn*, flagship of the Asiatic Fleet, participated in the activities around Vladivostok, Siberia, in 1918.

In June, 1918, Vladivostok and practically all of Siberia, was under the control of the Bolsheviks. The Bolsheviks, assisted by German and Austrian prisoners of war, were resisting the advance of the Czecho-Slovaks, who were trying to reach Vladivostok. In that city on June 29, 1918, there were ap-

proximately 12,000 well-organized Czecho-Slovaks, only about 2,500 of whom were armed or equipped. On the foregoing date the Czecho-Slovaks in the city took it over from the Bolsheviki after a three-hour battle near its center, and on the afternoon of that day Rear Admiral Austin M. Knight, commander in chief of the Asiatic Fleet, ordered a detachment of American marines ashore to guard the American consulate and to act as part of an allied force composed of British, Japanese, Chinese, and Czecho-Slovaks to patrol the city.

In July, 1918, marines from the *Brocklyn* acted as guards over German and Austrian prisoners of war on Russian Island, about 5 miles from Vladivostok, while marines from the same vessel constituted part of an allied military force of American and British marines, Japanese and Chinese bluejackets, and Czecho-Slovak soldiers which was organized to prevent a threatened strike and disorder among the workmen in the Russian navy yard at Vladivostok.

The *Albany* was at Vladivostok from April 2, 1919, until relieved by the *New Orleans* on July 25, 1919. Each of these ships, while they were anchored off Vladivostok, kept a small guard of marines at the United States naval radio station on Russian Island.

ACTIVITIES OF THE FIFTH BRIGADE.

The units of the Fifth Brigade were never together as a brigade in France or at any time an element of a division, and for that reason its commanding general was assigned additional duty in the American Expeditionary Forces.

Brig. Gen. Eli K. Cole, the first commanding general of the Fifth Brigade, arrived in France on September 24, 1918, and proceeded to headquarters Forty-first Division (First Depot Division), St. Aignan, France, reporting there October 1 to 4, 1918; on October 6, 1918, he joined the Second Division at Souain, France, as an observer, and remained with the Second Division until October 26, 1918, when he left to report at St. Aignan. On October 28, 1918, Brig. Gen. Cole arrived at St. Aignan and assumed command of the Forty-first Division (First Depot Division). From December 27, 1918, to January 10, 1919, he commanded the First Replacement Depot. From January 12 to February 3, 1919, he commanded the American embarkation center at Le Mans, France. From February 23, 1919, to March 4, 1919, he commanded the forwarding camp at Le Mans, France. During the period March 5 to 21, 1919, Brig. Gen. Cole was occupied in inspecting the units of the Fifth Brigade. He left Tours, France, on March 31, arrived at Brest, France, same day, was detached from the American Expeditionary Forces on March 31, and sailed for the United States on the *Mauretania*, arriving at New York April 7, 1919.

Brig. Gen. Smedley D. Butler relieved Brig. Gen. Cole as commanding general of the brigade on April 9, 1919, and retained command until it was demobilized in August, 1919.

One of the most prominent and outstanding features of the American Expeditionary Forces was the administration of Pontanezen Camp, at Brest, France, by Brig. Gen. Smedley D. Butler, United States Marine Corps, from October 6, 1918, to the latter part of July, 1919. The words of the citation conferring upon him the Army distinguished service medal describes in general terms the important work accomplished by Brig. Gen. Butler:

"Smedley D. Butler, brigadier general, United States Marine Corps. For exceptionally meritorious and distinguished services. He has commanded with ability and energy Pontanezen Camp, at Brest, during the time in which it has developed into the largest embarkation camp in the world. Confronted with problems of extraordinary magnitude in supervising the reception, entertainment, and departure of the large numbers of officers and soldiers passing through this camp, he has solved all with conspicuous success, performing services of the highest character for the American Expeditionary Forces."

Brig. Gen. Butler returned to the United States in command of the Fifth Brigade, on the *Siboney*, arriving at Hampton Roads, Va., on August 8, 1919.

ELEVENTH REGIMENT OF MARINES.

Col. George Van Orden commanded the Eleventh Regiment during its entire existence. The Eleventh Regiment was split up, its several units being stationed in various parts of France. Units of this regiment performed duty at various times at the following places: Brest, Tours, Montlerchaume (Indre), Havre, Gievres (Loire-et-Cher), Marseilles, Toulon (B-du-Rhone), Miramas (B-du-Rhone), Issoudun (Indre), La Pallice, La Rochelle (Charante Inferieur),

Mehun (Cher), St. Aignan-Noyers, Romorantin (Loire-et-Cher), Marans, Nevers, Algrefeuille, Barmant, Somme, Chateauroux (Indre), Camp Covington (Camp Carret) near Marseilles, Paris (headquarters detachment American Peace Commission).

The officers and men performed duties of various kinds, among such being: Post commanders, post and assistant post adjutants, personnel adjutants, regulating officers, assistant to the depot engineer, receiving officers, entertainment officers, assistant post chaplain, police officers, prison officers, camp guards, dock guards, commanding officers of troops, police sergeants, inspectors of the guard, district fire marshals, post welfare officers, district athletic officers, assistant provost marshals, fire patrol officers, fire marshals, transportation guard service, guard duty over prisoners, quartermaster property guard, interpreters, etc.

THIRTEENTH REGIMENT OF MARINES.

Col. Smedley D. Butler commanded the Thirteenth Regiment from the date of its organization until November 19, 1918, on which date Lieut. Col. Douglas C. McDougal assumed command and remained its commanding officer until it was demobilized.

Like the Eleventh Regiment, the units of this regiment performed duty in the various posts in the Services of Supply, among such places being Brest, Bordeaux, St. Nazaire, La Rochelle, La Pallice, Rochefort, Montoir, Bassens (Gironde), Sursol (Gironde), Casino-de-Lilas (Bordeaux), La Teste (Gironde) Beau Desert (Gironde), Nantes, St. Sulpice (Gironde), Savenay, St. Loubes (Gironde), Lormont, Carbon Blanc, Grange Neuve, Genicart, Croix d'Hins, La Baule, Isle of Ste. Anne (Nantes), Pen Houet, Usine Brulee.

The officers and men performed duties of various kinds, among such being provost guard, hospital-center guard, camp guard, railroad transportation officers, commanding dock guard, dock guard, unloading ships, erecting tents at Pontanezen Barracks, military police, warehouse guards, conveying of railroad trains, special guards for shipments of commissary supplies, assistants to camp commander at Pontanezen Camp, prison guards, assisting thousands of convalescent and sick soldiers who disembarked from the *Leviathan* to get to Camp Pontanezen, Inspector General's Department, base section No. 1, stockade guard, traffic police, motor transportation convoy guard, dock guard secret service, segregation camp, and railway patrol.

THE FIFTH BRIGADE MACHINE GUN BATTALION.

Maj. Ernest A. Perkins commanded the Fifth Brigade Machine Gun Battalion from the date of its organization until November 4, 1918; Capt. Franklin A. Hart, from that date until November 12, 1918; and from November 12, 1918, to date of demobilization Maj. Allen H. Turnage was the commanding officer.

This battalion performed duty at Camp Pontanezen during its entire stay in France.

MARINE CORPS CASUALTIES.

During the period of the war the Marine Corps personnel suffered casualties in actual battle in France with the American Expeditionary Forces (Second Division and Aviation); in Aviation, while operating as part of the naval service in France; and in the West Indies, in operations against the bandits of Santo Domingo.

Marine Corps deaths in the American Expeditionary Forces, as obtained from Marine Corps records, are divided as follows:

Character.	Officers.	Enlisted men.	Total.
Killed in action.....	45	1,420	1,465
Died of wounds received in action.....	30	961	991
Died of accident.....	3	24	27
Died of disease.....	14	255	269
Other causes.....	1	11	12
Total.....	93	2,671	2,764

The following is a summary of the casualties sustained by the Fourth Brigade of Marines from March 15 to November 11, 1918, as published in General Orders, No. 66, Second Division, American Expeditionary Forces, dated July 2, 1919:

Fourth Brigade casualties.

	Killed.		Died of wounds.		Missing.		Wounded severely.	
	Off- cers.	Men.	Off- cers.	Men.	Off- cers.	Men.	Off- cers.	Men.
Toulon sector (Verdun), Mar. 15-May 13.....		12	2	44				16
Aisne defensive and Chateau-Thierry sector, May 31-July 9, 1918.....	25	724	9	304		33	3	322
Aisne-Marne offensive, July 18-25, 1918.....	10	156	5	104		66	9	250
Marbache sector, Aug. 9-22.....		1		1				2
St. Mihiel offensive, Sept. 12-Sept. 16.....	3	57		86		11	3	124
Meuse-Argonne (Champagne), Oct. 1-Oct. 10.....	9	320	8	155		31	23	380
Meuse-Argonne offensive, Nov. 1-11.....	8	189	1	59		20	7	222
Total.....	55	1,459	25	753		161	45	1,316

	Wounded slightly.		Wounded, degree undetermined.		Gassed.		Total.	
	Off- cers.	Men.	Off- cers.	Men.	Off- cers.	Men.	Off- cers.	Men.
Toulon sector (Verdun), Mar. 15-May 13.....	6	46		89	4	287	12	494
Aisne defensive and Chateau-Thierry sector, May 31-July 9, 1918.....	20	656	46	2,123	9	436	112	4,598
Aisne-Marne offensive, July 18-25, 1918.....	20	459	30	911	2	39	76	2,015
Marbache sector, Aug. 9-22.....		8		3				15
St. Mihiel offensive, Sept. 12-Sept. 16.....	6	334	4	257		4	16	903
Meuse-Argonne (Champagne), Oct. 1-Oct. 10.....	43	862	6	480	6	141	95	2,369
Meuse-Argonne offensive, Nov. 1-11.....	20	467	6	206	3	55	45	1,218
Total.....	115	2,862	92	4,099	24	962	356	11,612

AVIATION CASUALTIES.

The following table shows the casualties sustained by the Marine Aviation forces between April 6, 1917, and November 11, 1918:

Character.	Officers.	Enlisted men.	Total.
Killed in action.....	2		2
Died of wounds received in action.....	1		1
Died of accident.....	6	6	12
Died of disease.....	1	25	26
Died of other causes.....	1		1
Wounded in action.....	2	3	5
Total.....	13	34	47

TOTAL MARINE CORPS DEATHS.

From April 6, 1917, to September 10, 1919, 131 officers and 3,489 enlisted men died; a total of 3,620 Marine Corps deaths from all causes.

CASUALTIES IN THE DOMINICAN REPUBLIC.

During the period between April 6, 1917, and November 11, 1918, 1 officer was wounded in action, 4 enlisted men were killed in action, and 13 wounded in action in the Dominican Republic in operations against bandits.

Two marines died when the *Cyclops* was lost at sea.

Of the 60 naval medical officers, 12 naval dental officers, and 500 enlisted men of the Medical Corps of the Navy serving with the marines in the American Expeditionary Forces, 1 commissioned officer and 12 enlisted men were killed and 8 commissioned officers and 101 enlisted men were wounded or gassed.

RIFLE PRACTICE—RIFLE AND PISTOL COMPETITIONS.

In recent years the Marine Corps has devoted a great deal of time and energy to rifle practice, believing that one of the first requirements of a soldier is to know how to shoot. During the period of the war target practice was given special attention, and in 1918 it was announced that no enlisted man would be sent overseas who had not qualified as marksman or better. This announcement created even greater interest than before in target practice among the enlisted personnel, and gratifying results were obtained on all rifle ranges.

The percentage of marksmanship qualifications of the enlisted personnel of the Marine Corps on various dates in the American Expeditionary Forces and in the United States was as follows:

Date and place.	Per-centage.
Entire Marine Corps, Apr. 6, 1917.....	48.0
Marines of American Expeditionary Forces, Nov. 11, 1918.....	68.1
Entire Marine Corps, Nov. 30, 1918.....	67.1
Entire Marine Corps, Mar. 1, 1919.....	66.0
Marines of American Expeditionary Forces, July 1, 1919.....	81.6

The number of marksmanship qualifications of the last six years in the Marine Corps was as follows:

Classification.	1914	1915	1916	1917	1918	1919
Expert rifleman.....	596	883	1,287	1,709	6,019	7,851
Sharpshooter.....	2,749	2,536	1,984	2,373	8,933	10,642
Marksmen.....	757	1,471	2,594	6,011	14,826	21,918
Total qualified.....	4,102	4,890	5,865	10,093	29,778	40,411
Percentage.....	0.415	0.493	0.591	0.379	0.670	0.828

During the period of the war the Marine Corps rifle teams, teams representing Marine Corps units, and teams partly composed of Marines, engaged in seven important competitions, and won many of the most important trophies given for marksmanship.

MARINE CORPS AVIATION.

On April 6, 1917, the marine section of naval aviation consisting of 5 officers and 30 enlisted men, was stationed at the naval air station, Pensacola, Fla., as part of the complement of that station.

During April, May, and June, 1917, the marine aviation section was transferred to a combination land and water station for marine fliers at the navy yard, Philadelphia, Pa., and the training of personnel for land flying began. The official designation of this organization was the Marine Aeronautic Company. Training in observation balloons was done in addition to the heavier-than-air work.

On October 12, 1917, this Marine Aeronautic Company, then consisting of 34 officers and 330 enlisted men, was divided into the First Aviation Squadron, consisting of 24 officers and 237 enlisted men, and the First Marine Aeronautic Company, consisting of 10 officers and 93 enlisted men.

On October 14, 1917, the First Marine Aeronautic Company was transferred to Cape May, N. J., and took over the naval air station at that place.

On December 7, 1917, the First Marine Aeronautic Company, then consisting of 12 officers and 133 enlisted men, was ordered to Naval Base 13, Ponta Del-

gada, Azores, arriving there on January 21, 1918. This organization operated an antisubmarine patrol station of 10 R-6 seaplanes, 2 N-9 seaplanes, and later 6 HS-2-L flying boats until the station was ordered abandoned on January 24, 1919, when it was ordered to return to the United States, arriving at the marine flying field, Miami, Fla., March 15, 1919. Maj. Francis T. Evans was in command from January 9 to July 18, 1918, and Maj. David L. S. Brewster from July 19, 1918, to January 20, 1919.

On October 17, 1917, the First Aviation Squadron was transferred from the marine flying field, navy yard, Philadelphia, Pa., to the Army training field at Mineola, Long Island, where instruction and training were carried on in land flying. On December 31, 1917, this organization was transferred to Gerstner Field, Lake Charles, La., for advanced training.

In March, 1918, the marine flying field, Miami, Fla., was established, and on March 31, 1918, the First Aviation Squadron was transferred to that field from Lake Charles, La.

Four marine squadrons of land-fighting planes and a headquarters company were organized to operate under the Navy as the day wing of the northern bombing group, in northern France, which operated in the Dunkirk area against German submarines and their bases at Ostend, Zeebrugge, and Bruges.

On July 13, 1918, the first marine aviation force, consisting of Squadrons A, B, C, and Headquarters Company, left Miami, Fla., and embarked on board the *De Kalb* at New York City for France July 18, 1918. This organization consisted of 107 officers and 654 enlisted men, and when Squadron D joined in October, 1918, it consisted of 149 officers and 842 enlisted men. On July 30, 1918, the Day Wing disembarked at Brest, France, and proceeded to its aerodromes, between Calais and Dunkirk, where they established camp and prepared the aerodromes for use. The personnel of the Day Wing was completely organized and ready for service two weeks after their arrival in France. Part of the planes and equipment of this organization arrived at Pauillac, France, before the organization reached France on July 30, 1918. On September 28, 1918, one plane was delivered to the Marine Day Wing.

On October 5, 1918, Squadron D of the Day Wing, consisting of 42 officers and 188 enlisted men, arrived at Le Fresnoe aerodrome, completing the four squadrons of the Day Wing. During the month of October additional planes were delivered to the Day Wing.

In order to prevent the personnel, who were completely trained and ready for action when they reached the front, August 2, 1918, from getting badly out of practice, the commanding officer Day Wing requested permission from the British aviation forces in the vicinity to be allowed to assign certain Marine pilots to operate with their squadrons until the Marine planes were delivered. As many Marine pilots as could be accommodated were operating with British squadrons until the end of the war, and were highly complimented by the British officers. The Day Wing carried out 14 independent raids far behind the enemy lines, did considerable damage, and brought back valuable information.

The organization participated actively and creditably in both offensives on the Flanders front. It was learned after the armistice that one raid resulted in the death of 60 enemy officers and 300 enlisted men. A feat worthy of mention was performed by Marine Corps pilots. A French regiment was cut off by the enemy near Stadenburg. It was decided to attempt to feed them by aeroplane. Marine Corps pilots loaded up with food and flew low over this isolated regiment and successfully dropped 2,600 pounds of food to them in the face of heavy fire from artillery, machine guns, and rifles. This process was continued for two days, until the regiment was extricated.

Maj. Alfred A. Cunningham commanded the Day Wing from the date of its organization to December 7, 1918, except the period August 1 to 7, 1918, during which time Maj. Roy D. Gelger was in command.

While in Europe the Marine flyers served with Squadrons 213 (pursuit squadron), 217, and 218 (bombing squadrons), Royal Flying Corps of England, and with pursuit, observation, and bombing squadrons of the French Flying Corps.

In February, 1918, the Marine aviation section of 8 officers and 40 enlisted men was organized and stationed at the naval air station, Miami, Fla. The personnel of this section was later increased and served at that station throughout the war, taking over the deep-sea scouting of that station. Capt. Thomas R. Shearer was in command.

STRENGTH AT BEGINNING AND END OF WAR.

The strength of marine aviation on April 6, 1917, and on November 11, 1918, was as follows:

Apr. 6, 1917:

Commissioned officers	4
Warrant officer	1
Enlisted men	30

Total 35

Nov. 11, 1918:

Commissioned officers	250
Warrant officers	32
Enlisted men	2, 180

Total 2, 462

STATIONS.

The following are the stations at which marine aviators operated, showing whether they operated independently, with the Navy, or with the Army:

Independently: Marine flying field, Miami, Fla.; balloon company, Marine Barracks, Quantico, Va.; Naval Base No. 13, Azores; marine flying field, Philadelphia, Pa.; and naval air station, Cape May, N. J.

Navy: Marine section naval air station, Miami, Fla.; day wing, Northern Bombing Group, France; and naval air station, Pensacola, Fla.

Army: Roosevelt Field, Mineola, Long Island; Gerstner Field, Lake Charles, La.; and Army balloon schools at St. Louis, Mo., and Omaha, Nebr.

PLANES OPERATED BY MARINES.

The number of planes operated by marine aviators at Pensacola, Fla., on April 6, 1917, was four, and the type AH Curtiss.

On November 11, 1918, the following planes were operated by the personnel of marine aviation:

Marine flying field, Miami, Fla.: De Haviland 4's, Curtiss JN's, Thomas-Morse scouts, and M-1 defense planes.....	118
Naval air station, Miami, Fla.: HS-1-L, and HS-2-L flying boats, and R-6 Curtiss seaplanes.....	24
Balloon company, Quantico, Va.: N-9 and R-6 seaplanes.....	3
Caquot and kite balloons.....	4
Naval Base No. 13, Azores: R-6 and N-9 seaplanes, and HS-2-L and HS-1-L flying boats.....	18
Northern Bombing Group, France: De Haviland 4's and 9's.....	177

MARINE AVIATION STATISTICS.

Marine squadrons overseas in France.....	5
Total officers in France.....	165
Total enlisted men in France.....	890
Marine officers serving with Army Air Service, American Expeditionary Forces.....	6
Overseas, outside of France: 1 squadron, 12 officers, 135 enlisted men, naval base No. 13, Ponta Delgada, Azores.	
Officers completely trained ready for overseas aviation duty in the United States on Nov. 11, 1918.....	100
Enlisted men completely trained ready for overseas aviation duty in the United States on Nov. 11, 1918.....	1, 150
Number of squadrons and companies in United States Nov. 11, 1918.....	3
Total officers in United States on Nov. 11, 1918.....	100
Total enlisted men in United States Nov. 11, 1918.....	1, 150
Total number of cadets under training (at all times).....	225
Cadets completely trained (in all three branches) as bombers, chasse pilots, and seaplane fliers, total commissioned from Oct. 1, 1918, to date.....	175

Raids participated in by Marine fliers serving with the British and French.....	43
Total number of bombing raids completely Marine.....	14
Total pounds of bombs dropped.....	52,000
Number of food raids.....	5
Pounds of food dropped.....	2,600
Number of enemy aircraft accounted for officially.....	12

HOW MARINES WERE HOUSED AND SUPPLIED.

Upon the increase of the Marine Corps from 17,400 to 30,000 and later to 75,500 it became necessary to increase the commissioned, warrant, and enlisted personnel of the quartermaster's department, in order that it might successfully meet the heavy demands made upon it by the war and by the large increase in strength.

Due to the changes in the method of purchasing rations caused by existing conditions, it became necessary to establish commissary storehouses at San Francisco, Charleston, and Baltimore, at which to maintain reserve supply stores. The Baltimore storehouse was later moved to Philadelphia. At the beginning of the war the Marine Corps had in its depots at Philadelphia, Pa., and San Francisco, Calif., a small surplus stock, which had been accumulated from the regular appropriations, sufficient to outfit 8,500 men; consequently when the war was declared against Germany and the corps was increased, first to 1,323 officers and 30,000 men (act of May 22, 1917), and, secondly, to 3,341 officers and 75,000 men (act of July 1, 1918), it was necessary to provide simultaneously clothing, equipage, food, and shelter for these men.

All supplies, as far as practicable, were purchased in the usual manner, by the bid and tender plan, only those articles on which no bids were received or those controlled by the War Industries Board being allocated.

To furnish accommodations for the increased personnel, cantonments on a large scale were built at Quantico, Va., and Paris Island, S. C., and on a smaller scale at Mare Island, Calif. This work was expeditiously handled and afforded suitable temporary accommodations during the war.

DEPOT OF SUPPLIES AT PHILADELPHIA.

During the period of the war the depot outfitted and equipped 36 expeditionary units for service in France and the West Indies, and over 31,000,000 pounds of various kinds of supplies were shipped on Government bills of lading. The depot departments were so organized that it was only necessary to expand each division of the office forces and increase the number of employees and machines in the manufacturing departments in order to meet the increased demands during the war. The personnel of the depot on June 30, 1919, was as follows: Thirteen commissioned officers, 7 warrant officers, 2 civilians, 102 enlisted men of the regular service, 21 reservists, and 1,095 other employees of all classes, making a total personnel of 1,240.

The activities of the depot at San Francisco were increased during the war by the greater number of recruits to be outfitted on the west coast, and by the establishment of recruits to be outfitted on the west coast, and by the establishment of the subsistence branch at this point. This depot supplied all posts on the west coast, and furnished the supplies for the Marines in the Orient.

The Charleston, S. C., depot was established soon after the declaration of war for the purpose of supplying all posts south of Norfolk, including the West Indies. The storage facilities consisted of 7 warehouses and a total floor space of 124,778 square feet. A total of about 14,287 tons of stores were shipped from this depot during the fiscal year 1919, these stores being valued at approximately \$12,000,000; during the same period approximately 18,000 tons of stores were received, at an estimated value of \$15,000,000. Practically all shipments of supplies of every description for troops in the West Indies are made from this depot.

EXPENDITURES.

The expenditures of the quartermaster's department for the fiscal years ending June 3, 1917, 1918, and 1919, were as shown below, exclusive of appropriations for public works, under the Navy Department, from which figures

the enormous increase in the activities and responsibilities of this department, caused by the war and by the increase in strength, is evident :

Subhead.	1917	1918	1919
Provisions.....	\$1,612,908.30	\$6,725,893.05	\$10,287,965.53
Clothing.....	2,173,501.59	11,123,760.36	20,275,456.01
Fuel.....	248,606.82	590,120.91	989,573.08
Military stores.....	1,520,299.39	6,371,978.10	13,952,476.49
Camps of instruction.....	31,871.04	30,945.83	
Transportation and recruiting.....	620,667.75	1,514,657.77	3,064,009.21
Repairs of barracks.....	216,715.56	3,754,241.58	5,883,065.69
Forage.....	75,018.94	161,614.81	163,132.90
Commutation of quarters.....	164,497.24	402,402.51	363,484.53
Contingent.....	983,984.91	4,864,825.25	8,674,299.61
Expenditures under appropriation, "Reserve supplies, United States Marine Corps"			2,510,527.44
Purchases under second deficiency act from United States Army.....			772,540.00
Total maintenance quartermaster's department, United States Marine Corps.....	7,648,061.54	35,540,440.17	66,936,590.49

Secretary DANIELS. Gentlemen, I have a few other matters that I will present when they reach here from the department. They will be here in a few minutes. I am trying my best to follow your desire to end this matter Thursday afternoon.

The CHAIRMAN. Very well.

Secretary DANIELS. I had not supposed until yesterday that we could do it; but we will be able to do it.

The CHAIRMAN. You will be able to?

Secretary DANIELS. Yes; we will be able to follow your suggestion about that. I can finish in a very few minutes if I may place in the record this matter on the work of construction and another on the work of aviation. I think that is all, except one statement. I will send them to the stenographer.

The CHAIRMAN. You can give them to him to-day?

Secretary DANIELS. Oh, yes; they will be up here in half an hour. That will finish what I have to offer for the record, and then I will finish Thursday with the hearing.

The CHAIRMAN. Very well.

Secretary DANIELS. I wish to take up the personnel question on Thursday, and with a brief ending I can finish certainly Thursday afternoon, I feel quite sure. I worked last night in order to meet your desires, and I will also work to-morrow night.

The CHAIRMAN. All right.

Secretary DANIELS. Mr. Chairman, Admiral Sims's highest and dearest ambition, it would appear, was blasted when this Government gently but firmly declined to permit him to become a member of the British Admiralty. Admiral Sims expresses his deep regret and embarrassment at not being allowed to accept this honor, and related how the King himself had "again asked what news there was from our Government as to the invitation to make me a member of the board," in a letter written from London, January 31, 1918, in which Admiral Sims said :

There is another subject which has caused me some embarrassment, and that is the refusal of our Government to accept the invitation of the British Government to make me an honorary member of the Board of the Admiralty. This is a remarkably complimentary invitation and it was issued only after the authorities had consulted the King on the subject.

Referring to the last cable I sent on this subject, at the request of Sir Eric Geddes I communicated the reply to him to the effect that our Government thought the appointment would have a desirable effect but that they found it would be displeasing to the other Allies. He, therefore, suggested that the matter be allowed to rest until the other Allies could be communicated with. This he thought best to do when the various Chiefs of Staff came together for the recent Allied Naval Council on January 22. He discussed this matter with both the French and Italian Chiefs of Staff and they not only both declared it was perfectly agreeable to them but they both said they thought it would be a very good thing. In addition, Admiral de Bon said that he thought something of the same kind might be done with respect to his Government, and he said he would let me know about the details of this later.

Yesterday the ambassador sent for me and told me that Sir Eric Geddes had been to see him and explained to him that there was now no objection on the part of the Allies to this appointment being made, and he suggested to the ambassador that this information be communicated to our Government. This, I believe, has been done.

When I was appointed naval attaché the British State Department was notified by the ambassador in a letter of the usual form. I did not see the letter before it went and it included the usual paragraph in reference to presentation of the attaché to the King. Of course, it was a mistake to include this paragraph, as I already had been presented to the King, and the object of the presentation is only that he may be personally acquainted with people in that position. I tried to head the thing off, but it was not successful, and I had to be presented again. At this interview the King showed a most surprising accuracy of information about naval affairs. He knew the details of the latest action between submarines and antisubmarine vessels. He even said that he was sorry to hear that our new destroyers would not be coming out as fast as had been originally thought. I assume that he is kept informed by conversations with the First Lord and the First Sea Lord of the Admiralty. I know that Jellicoe used to go and see him two or three times a month. As for Admiral Wemyss, he and the King were kids together on board ship in their youth and he knew him very familiarly. At this interview the King asked again—

It seems that the King had talked to Admiral Sims before about his becoming a member of the British Admiralty—

what news there was from our Government as to the invitation to make me a member of the board.

Admiral Sims then goes on to say in this letter:

You can therefore readily imagine that the refusal of our Government to accept this invitation is a continuous embarrassment to me.

Imagine, Mr. Chairman, an American admiral, charged with American duty, with headquarters in another country, desiring to be a member of the Admiralty of that other country; and when his own Government, with the true Americanism that dominates it, refuses to allow him to become a member of the British Admiralty, he writes that it is a continuous embarrassment to him. I will say in this connection that it would have been a continuous embarrassment to the American people if the Government had permitted any officer of the American Navy to become a member of the Admiralty of any other nation in the world.

The CHAIRMAN. To be an honorary member, was it not?

Secretary DANIELS. That is what they call it; yes. The same thing applies; just as un-American to be honorary as anything else.

The proposal to make Admiral Sims a member of the British Admiralty was communicated to our Government in the following cablegram from the American ambassador:

LONDON, January 29, 1918.

The King has given his approval to the proposal of the British Admiralty to make Sims an honorary member of the Board of the Admiralty, and has

expressed his hope that the plan will be approved by the Lords of the Admiralty. Approached the Italian and French naval chiefs of staff during their recent visit here and they both expressed the heartiest approval. The French admiral declared that he would at once ask his naval authorities to take corresponding action.

The proposed plan is merely a complimentary expression of the cordial working relations that exist, and Sims's membership in Board of Admiralty will automatically cease when his command here ends. It is a compliment without precedent, no member of another navy ever having been so honored.

Geddes asks me to send this explanation in hope of your approval of the plan. He regards it only as a mark of the high esteem in which the British Admiralty hold the American Navy and as an evidence of their cordial working relations.

PAGE.

When the cable from the ambassador was brought to me I directed the officer to cable and ask if the British Government proposed also to make admirals of the other Allies in London honorary members of the British Admiralty. I was informed that such was not their purpose, but this distinguished honor was to be given only to the American admiral on duty in London.

While appreciating the spirit of the King and Lords of the Admiralty, the suggestion that an American admiral should hold membership in the Admiralty of another country did not appeal to the American authorities, and I therefore addressed the following letter to the State Department, which was transmitted to the American ambassador at London:

NAVY DEPARTMENT,
Washington, February 2, 1918.

SIR: I have the honor to refer to the dispatch of the American ambassador at London, dated January 29, 1918, to the Department of State, relative to making Vice Admiral Sims a member of the Board of the Admiralty.

The proposal of the British Government to make Vice Admiral Sims an honorary member of the Board of Admiralty has been carefully considered by the Navy Department. The Navy Department views with extreme satisfaction the evidence of cordial cooperation between our naval forces and those of Great Britain. This department is most anxious that these relations should not only be continued but encouraged, and to this end it will make every effort consistent with our well-established international policies.

This Government has adopted the general policy of declining to permit its officers to accept from foreign Governments any decoration or distinctive honors in acknowledgment of their professional qualifications or as a reward for meritorious service. Should this Government sanction the acceptance of an honorary membership to the Admiralty Board by an officer in the naval service of the United States as a complimentary expression of the cordial relations existing between that officer and the Admiralty, its action would unquestionably be viewed as a violation of the policy stated above.

The Navy Department feels that this Government values most highly the offer to bestow such an unprecedented honor upon an officer of the Navy and appreciates fully the splendid spirit which prompts the offer, but it regrets that in order to maintain the principle stated above the offer must be declined.

Sincerely, yours,

JOSEPHUS DANIELS.

The honorable the SECRETARY OF STATE.

This desire of Admiral Sims to be a member of the British Admiralty was in keeping with his desire to accept decorations from foreign Governments. On September 22, 1917, I had written the Naval Affairs Committee of the House of Representatives opposing a joint resolution permitting the acceptance of foreign decorations, and again, in a letter to the chairman of that committee opposing another like resolution, I stated "The department is opposed to the

objects of this act—i. e., the acceptance and wearing of decorations or medals presented by our allies—and desires to express its disapproval thereof." In a letter dated December 30, 1917, Admiral Sims wrote:

The force commander recommends that steps be taken to obtain legislation which will permit United States naval personnel to accept decorations of foreign Governments. Experience in this force demonstrates clearly that such recognition is prized as highly by our personnel as it is by the personnel of foreign service.

That I deny, and for the whole Navy. I do not believe for one minute that it was as much desired by Americans as it was by the British.

Its effect upon morale and efficiency is marked.

I do not concur in that.

The mere fact that the British Government has expressed a desire to award decorations to certain of our ships became known, and its effect was pronounced.

I do not agree at all with any such suggestion, that it had any effect at all upon the courage, the bravery, the high morale of the men of the American Navy.

On July 31, 1918, I sent the following confidential telegram to Vice Admiral Sims:

The State Department has been directed to diplomatically inform all European Governments that this Government does not desire any decorations conferred upon American officers, either Army or Navy. It is desired that this fact be held in confidence in deference to feeling of allied Governments; but this Government does not wish such decorations as press reports say were conferred upon Rodman, Strauss, Bliss, and Pershing. Your action in declining to accept approved.

In the meantime Congress, in the Army bill, without the knowledge of the President or the Secretary of the Navy, had authorized those in the "military forces of the United States serving in the present war," to accept decorations from allied Governments. I understood that Admiral Sims had been offered a decoration by the King of England and had declined it. I cabled him my approval of his declination. I wish that I had been right, and I wish that he had declined.

Five days later—August 4, 1918—Admiral Sims sent the following cable, showing that he had not declined.

The CHAIRMAN. What was that telegram?

Secretary DANIELS. That was quoting the Army bill, saying that men in the foreign service could accept honors. The cable sent by Admiral Sims is as follows:

The following will show my extremely embarrassing position: Having received your 872 authorizing any officer or any enlisted personnel of the military forces of the United States to accept and wear any medal or decoration tendered by any nation concurrently engaged with the United States in the recent war, I informed Rodman, in answer to his inquiry, that he was authorized to receive a decoration from the King upon the latter's visit to the Grand Fleet, and Rodman accordingly received it.

I also authorized Lieut. Commander Carpenter to receive the D. S. O. The King presented it in person several days ago, and Carpenter sailed for home.

In reply to the Admiralty's inquiry I have stated that I would receive the similar decoration for absent officers and men of the destroyers.

I received no official or unofficial notice of the British Government's intention to give me a decoration. There was a notice in the paper about two

weeks ago. Yesterday I received a note from an official of the Palace, stating that the King wished to see me at 2.30, if my duty would permit. He was to receive the naval committee at 3, and I supposed it was concerning them, as I had prepared for him memoranda defining their functions. Instead he presented me with the G. C. M. G., stating that he would have done so before, but was awaiting information from Lord Reading that our Government had authorized our officers to receive decorations, which information he had received. Subsequently, I received the department's dispatches, 9273 and 9275, which was my first knowledge that our Government had disavowed the authorization approved with the Army bill July 9.

The present position is that the officers mentioned and I have accepted the decorations in question in the full belief that we were carrying out our Government's wishes, assuming that the personal refusal of a medal authorized by one's government would be an offense to the government offering it.

The fact of these medals having been presented by the King in person has been published in the press.

The department is mistaken in assuming that I declined the decoration. I could not have done so as it was not offered to me until it was handed to me by the King himself, who stated that he desired to show the appreciation of the British Government. Do you wish that, under the circumstances described above, the medal be returned to the King?

Of course, under the circumstances, I could not do otherwise than send the following cable:

In view of action already taken presumably before the President's request reached the King, there is nothing to be done, and of course, in this delicate matter decorations could not be returned. I take it that no others will be given except such as might be awarded for distinguished and courageous conduct in battle.

It seems that the tender of a position as honorary member of the British Admiralty by the King of England was not known in Great Britain, as the following cablegram printed in the New York World in its issue of May 13, 1920, indicates:

SIMS'S REVELATIONS SURPRISE LONDON.

LONDON, MAY 12.

The statement of Secretary of the Navy Daniels in the controversy provoked by Admiral Sims has created a big sensation here. For, apparently, the proposal that Admiral Sims should join the British Board or Admiralty in a consultative capacity came as a surprise, although it was known when it was made in American circles here.

Admiral Sims's eulogy, later, of Admiral Jellicoe as the true author of British naval success is regarded as a characteristic indiscretion. For it was made in a public speech and at the moment of the acute controversy here between the adherents of Admiral Jellicoe and Admiral Beatty. But this eulogy must be read in connection with the offer of a British naval position made to Admiral Sims previously.

The British order he received was the Grand Cross of St. Michael and St. George, a decoration given ordinarily to Colonials or for services in connection with British colonies.

Mr. Chairman, in the course of these hearings I have had occasion, while giving very high commendation to the great service of the British Navy, to record my feeling in the matter of the barrage and other bold and audacious enterprises, the wisdom of which was proved, which might be conceived as a criticism of that friendly nation with which we cooperated on such pleasant terms and so effectively during the war, and I think it is proper for me to place in the hearing as an expression of the feeling of the American Navy toward the British Navy a brief speech that I made in Great Britain at a

luncheon given in my honor by the Anglo-American Society in London, Thursday, May 1, 1919. With your permission I will present that for the record.

The CHAIRMAN. Mr. Secretary, will you not read that speech?

Secretary DANIELS. I will be glad to, Mr. Chairman.

Secretary Daniels here read aloud the speech referred to, which is here printed in the record as follows:

Extracts from address of Hon. Josephus Daniels, Secretary of the Navy of the United States, at a luncheon given in his honor by the Anglo-American Society and the Sulgrave Institution, in London, Thursday, May 1, 1919:

It is, I believe, more than a coincidence that this meeting of the Anglo-American Society which the American Secretary of the Navy and distinguished naval officers are privileged to attend, is held on the anniversary of a day that commemorates a notable American naval victory. On May 1, 1918, Commodore George Dewey, afterwards made "The Admiral of the Navy of the United States," in the early morning passed the torpedoes and obstructions in Manila Bay and won the battle which gave new prestige of the Navy of our country and added a new luminary in the firmament of fixed naval stars. Upon every ship flying the Stars and Stripes to-day there will be fitting recognition of this anniversary, a day which shines in our calendar. We, in America, can never forget the spirit shown by the brave Admiral Chichester, of the British Navy, in the days which followed Dewey's victory and that memory stirs our grateful appreciation particularly to-day. It was typical of the friendly relations that have long existed between the two navies. It was prophetic also of the closer cooperation which has been the crowning glory of British and American participation in the great war in which the fleets of these two mighty commonwealths were so united as for the time being to compose virtually one fleet.

We never think of Dewey's delicate and difficult task, after the signal victory, 21 years after, as we celebrate its having attained its majority, without deep and abiding love for the British Navy and the British people because of the wisdom, consideration, and friendship displayed by your Admiral at Manila. It is good on this day to recall, with American gratitude, and, I doubt now, with British pleasure, the outcome of the veiled threat of the German Admiral to contest the fruits of Dewey's victory in the Philippines. Admiral Dewey, out of that appreciation which every naval officer has for his responsibility to avoid trouble between his own and another country with which his Nation was at peace, withheld from his memoirs the full story of the tension almost to the breaking point caused by Admiral von Diederichs in those crucial days. We know enough of the circumstances, however, to understand the narrow escape from hostilities between the Navy of the United States and the Navy of Germany, and we have sufficient information to cause us always to be deeply sensible of the important and helpful part the British Admiral played in those anxious hours.

"What would you do," asked the German Admiral, "If I moved my ship over to the *Olympia* (Dewey's flagship)?"

It required just two words for an answer that we are happy to recall to-day. "Ask Dewey" was Admiral Chichester's Delphic to the uninitiated, and illuminating in the light of history, answer which was so well understood by the German admiral that he never moved his ship over to the *Olympia*, the crisis was averted, and to the day of his death Admiral Dewey held in grateful and fresh remembrance the action of the distinguished commander of the British naval forces in the Far East.

* * * * *

"Match the Navy." This was the keynote of the appeal of the Secretary of the Treasury of the United States during the Third Liberty loan, when, to make ready and effective war upon the submarines, the Navy personnel made such large subscriptions to the third issue as to have their action held up for the emulation of the whole country. The people of Great Britain, particularly the members of the British Navy, who were closely associated with them during the silent watches of the cruel war, can best know whether the United States Navy was worthy of the honor done it by selecting its achievements for national efficiency and national liberty as the high watermark of attainment.

It was our pleasure and we gladly embraced the opportunity shortly after the United States entered the war to send over a portion of our fleet to be associated with your British Grand Fleet. Our fleet and yours acted together to lay mines in the North Sea, to convoy ships bringing troops, to fight the stilettoes of the sea in all zones of danger and in every naval activity courage and skill were united. We kept all other ships of our Navy ready for sailing orders when the Allies felt a larger naval force might be needed, for from the day the United States entered the war there was no thought but readiness for the fullest and quickest cooperation and use of all our sea power where joint naval statemanship felt it could be best employed. It was a gratification to us at home to know that British experts regarded our fleet in home waters well disciplined and ready to come over at a moment's notice, as an invaluable reserve, as indeed we always deemed it. Our fleet at home was kept busy in the invaluable work of training recruits, and especially in training armed crews for merchant ships. It was tedious and, in a sense, work that brought no glory to officers and men. It was well done while our British brothers of the Grand Fleet waited in enforced inaction for the Germans, and suffered a great tedium, and both were making ready for the expected crisis, but each in a different way. Sometimes it is to be feared civilians of both countries never appreciated the essential power and use of those portions of our fleets not in the most infested areas, but removed from the area where we expected—nay, where we hoped—the decisive great naval engagement would give striking proof of the incomparable power of the allied fleets.

In America we hoped for that hour for which all other hours were but preparation. Here your naval fighters, as ours, were kept for the day when in fair combat in the open sea the opposing forces might in battle give the seal and eternal proof that the sea power of our countries would win as notable a victory as Nelson's or Dewey's. That this opportunity was not given, because the Germans knew the fate in store if they dared win or lose all by the sea fight, it must be confessed took away some of the anticipated satisfaction of the men of our navies. But we should remember that the victory was all the more complete, though lacking the glory of a titanic conflict and denying the human satisfaction of demonstrating that the men of the British and American Navy of to-day are of the same stuff as in the days when neither wind nor rain nor guns nor any other power could withstand their naval supremacy. It was the most humiliating spectacle in the annals of naval history—was the tame surrender of the much vaunted fleet that was organized with the boasted purpose to conquer the seas as the Prussian troops were to dominate the land. In truth that inglorious limping spectacle of defeat and disaster had a greater significance of complete undoing in the eyes of the world to-day and in history than could have come from a magnificent victory in a sea duel. It was not thrilling or spectacular. It did not stir the blood—the thing Navy men had made ready for and coveted as their heart's desire. But it did more: Wrote on sea and sky the imperishable doom; the "Thou are weighed in the balance and found wanting" and carried the same lasting message as when these fateful words were interpreted by the prophet of old.

May we not, borrowing the words used by our Secretary of the Treasury of our American naval fighters, give it the larger meaning and employing it to embrace your own and our own Navy's sentiment, say to the civilian peoples of both countries and of all free nations, "Match the Navy." I speak not now of daring service or of liberality or that initiative and skill which the world applauds. To Americans and to British peoples in the vast expense of both countries the call is "Match the Navy" of your country in mutual appreciation, in clear understanding, in full fellowship, and in that loving brotherhood and helpful comradeship which will forever unite the two countries in championship and sacrifice for democracy, liberty, and fraternity.

Why match the Navy? The most beautiful fruit of cooperative effort and sincere friendship the war has ripened for us is the spirit which characterizes the intercourse of our men of the sea. They were privileged to know each other to the core, to plan together and to test each other's knowledge of strategy and tactics and weapons of war, to go down together to the sea in ships unafraid when the perils of the deep called only for men of the best mettle. Together they undertook the most gigantic task known to navies, the barrage of the North Sea, where a mistake or lack of skill meant instant death and where the hardships were too great for any except the stoutest hearts and strongest bodies.

They and their equally brave allies hunted the submarine to his jungle in the trackless sea and together conquered the most insidious and most evasive and most murderous foe, which, without humane instinct, lay in wait for ships bearing noncombatants, sending ruthlessly to watery graves women and children in defiance of every law of the sea except the common law of the days of piracy. They transported millions of soldiers with a safety that seems almost miraculous. We can never forget that British ships brought over a million American soldiers from our shores, and the only limit of this invaluable contribution by the British was the limit of your large facilities. It was a service of such emergency and of such capital importance, that American appreciation is beyond any expression of appreciation in words.

The naval force of our countries were instant wherever protection was needed as well as wherever the foe dared challenge their supremacy. The Navy of my country and yours during those years—we called them fateful then, but history will call them glorious—worked together as a unified organization and came to feel as truly one as if separate flags did not fly above their ships. The flags, it is true, were different, but they symbolized the same consecration to world liberty and the same high resolve to again demonstrate that sea power is, in the last analysis, the determining force of the world. But better than that, or, rather, because of their mutual hardships and comradeship in love and sacrifice, the men of both navies, seeing eye to eye, came to regard each other as fellow crusaders. Ties of personal and national friendship were forged which can never be weakened, ties which are the best and surest guarantee of furnishing its large share of whatever mobile police the world's peace may require. What size this police force may be must be determined by the evolution of the League of Nations, happily, unanimously approved by the delegates from all the allied nations in the peace conference. It must be as powerful as world safety requires and, in the development of the workings of the League of Nations, must be reduced with all other armaments consistent with its decorations. The members of the league recognize that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international safety and the enforcement by common action of international obligations. Of one thing there must be no doubt: The end of competitive navy buildings has arrived. It would be a blunder, a calamity equal to a crime, if Great Britain and the United States should enter upon competitive naval buildings, either or both suspicious of the other.

As the common dangers and common experience of men in these two greatest navies brought to the men in each a better appreciation of the fact that their united strength was the most powerful agency to end the dreams of conquest by autocracy, so the continued cooperation in peace of our two great peoples in a league with our allies will be the best assurance of the blessings which will flow to the world out of the League of Nations.

Delighted as this brotherhood is, cemented forever in war for the men of the two navies, the outstanding lesson is that when all the peoples of these two countries know each other as intimately as do the men of the navies, all civilians will "match the Navy," not only in appreciation of each other's virtues but in a full comprehension that only in high resolve to make this good feeling and cooperation permanent can these two enlightened countries fulfill their mission of duty to themselves and responsibility to the world. It is too much to expect that these English-speaking peoples will always be in agreement, that their interests may not sometimes clash, and that there will not be men in each country who would love to drive a wedge which would keep them apart and antagonistic. It is as true of nations as of individuals that differences of opinion, honestly entertained and freely expressed, bind them closer together. When two men always express the same thought, it may be safely assumed that one is the thinker and the other the echo. Strong and virile men wish no such unity. This is equally true of strong and virile nations and have, perhaps, greater application in the case of the United States and Great Britain. In the long ago we had serious differences, or, rather, our Governments did. The peoples, with largely the same impulses and the same traditions, each in their own way have moved toward the same end, which is to make all Governments serve the expressed will of the whole people. But these ancient differences are remembered by us only

to serve and heighten our respect for each other and to give a pride that we drew our inspiration from the common refreshing stream of Runnymede.

We hope—most of us, at any rate, hope—that the foundation of the League of Nations will eventually, perhaps sooner than scoffers imagine, sound the death knell of at least inordinately large expenditure on great fleets. We realize to the full the anxiety—indeed, the urgent necessity—felt in Great Britain to reduce naval expenditures to the lowest level compatible with safety. The United States will, I am convinced, do nothing that international developments do not strictly require us to do to add to the naval burdens of this or any other power. As we recognize the political and geographical necessities which call for great British sea power we are convinced that Britons, on their part, recognize that similar necessities exist in our case. We, too, have a prodigious coast line. We have a great foreign trade, which is bound to grow a carrying trade that will grow with it, and obligations growing out of our League of Nations covenant. The United States does not aspire, as we believe Great Britain does not aspire, to possess much strength at sea that we can impose our decrees arbitrarily upon other free peoples. Such a tradition is wholly foreign to our political nature and utterly out of tune with our traditions. But if the evolution of the League of Nations is not such as its friends and devotees in Europe and in America hope that it may be, if competition in armaments must continue, as in the past, unchecked by any other consideration than a nation's financial capacity, then, regrettable as the choice will be, repugnant as it will be to the American people, it will be essential, from the dictates of elementary national interest, that they shall build and maintain a fleet commensurate with the needs of national defense and with our international obligations.

The CHAIRMAN. Was that the entire speech?

Secretary DANIELS. That was the entire speech.

Mr. Chairman, as to the war activities of the Bureau of Yards and Docks, the construction accomplished under the direction of the Bureau of Yards and Docks since this country entered the war amounts to a total of approximately \$346,000,000, over a hundred millions more than the total value of the Navy's shore improvements previous to the war. Despite the unprecedented demand for labor and materials, new records in construction were made and huge structures that ordinarily would have taken years to complete were built in a few months.

When war was imminent, there was such a rush of recruits that there was no question of securing enough men for the emergency. The necessary training, prior to duty afloat, required an immense increase of training stations; and, beginning in April, 1917, the department ordered work of expansion to proceed with the utmost dispatch and made allotments from the naval emergency fund, besides submitting estimates to Congress for additional appropriations. Provision was, with the utmost speed, made for housing 97,200 men, and construction was continued until there were complete accommodations for 192,875 men in winter and 205,275 men in summer, giving us the largest naval training-camp capacity that any navy ever had in all history.

In line with the policy of equipping and improving navy yards for warship construction, work had been begun in the latter part of 1916 on a program of expansion which involved a total expenditure during the war of approximately \$27,000,000. Works of tremendous magnitude and thoroughly modern in nature were executed at the principal yards, including foundries and machine shops with complete, up-to-date equipment for manufacture and handling of ships' parts, the greatest crane known to exist at the present time.

shipbuilding ways for the maximum warships contemplated, together with piers, storehouses, marine railways, dredging, and all accessories required in line with this new naval policy.

Private plants were financially assisted by the Navy, beginning early in 1917, toward the expansion of their productive capacity to meet emergency requirements in connection with the authorized increase of the Navy. Under careful supervision, direct and indirect financial aid was extended for the construction of many new plants and additions to and extensions of existing ones. It was due to this policy, in which approximately \$70,000,000 was invested, that the Navy owes in large part the tremendous increase in destroyers during the period of hostilities.

The provision of adequate power for the operation of navy yards became a matter of prime importance in view of the industrial expansion rapidly taking place. In all, about \$18,000,000 was expended for this purpose, including large extensions to power plants at Portsmouth, Boston, New York, Philadelphia, Norfolk, Mare Island, and Puget Sound. Training camps and hospitals, both permanent and temporary, required larger power-plant installations, rapidity of installation being essential in many such cases. The Navy is now in a much more secure position than before the war as regards an ample and efficient output of power for its shore activities.

Work on three maximum dry docks was carried on continuously at high pressure during the war, and two other maximum docks were being constructed by outside agencies—the Navy Department having made contracts for the use of the latter. Of these five, the dock at Philadelphia is the only one not completed at this time. The total outlay on the three docks constructed by the Navy will be approximately \$16,500,000, while a special appropriation of \$4,550,000 has been made for the purchase by the Navy of the great South Boston dry dock and its adjacent lands.

The largest office group in the world was constructed by the Navy Department in Potomac Park between April and October, 1918. This group contains floor space of more than 41 acres, has accommodations for 10,000 clerks, and cost seven and a quarter millions of dollars.

The Bureau of Yards and Docks erected for France the largest wireless station in the world, final completion having been obtained since the armistice. Other large construction projects were undertaken abroad, including aviation facilities having an appraised value of \$5,862,753. Admiral Sims sent 521 cables that required action by the bureau, requiring the preparation of 553 separate requisitions. Immediate attention was given to every request.

The bureau's contribution to naval aviation amounted to more than \$30,000,000 in construction work at home and abroad.

Ordnance storage was practically trebled in capacity, the expenditure being approximately \$11,000,000 in this direction. Torpedo and mine filling and storage facilities were provided, the latter having had a direct bearing on the outcome of the war. Submarine bases were established or expanded on an unprecedented scale.

The total funds available for the war work of the bureau approximated \$346,000,000, made up of direct appropriations of \$219,000,000

and allotments of \$127,000,000 from other sources. Of the total, approximately \$335,000,000 were used at home and \$11,000,000 abroad.

(The document in regard to construction submitted by Secretary Daniels is here printed in full, as follows:)

NAVY DEPARTMENT,
BUREAU OF YARDS AND DOCKS,
Washington, D. C.

From: Chief of the Bureau of Yards and Docks.

To: Secretary of the Navy.

Subject: Operations of the Bureau of Yards and Docks.

References: (a) Department's letter Op-12 of May 28, 1915; (b) General Board's letter of March 13, 1915.

WAR PLANS.

1. The above references transmitted the plan to insure readiness for war which furnished the basis for the bureau's recommendations and actions from that date. The necessary investigations were instituted; information was collected and put in shape for use; plans for necessary public works and utilities were prepared, and estimates for appropriations were submitted.

ACT OF AUGUST 29, 1916.

2. This act provided several items of great importance, the most important of which provided for the expansion of ship construction and the increased production of ordnance and ordnance material. The Secretary of the Navy was authorized to improve and equip seven navy yards for the construction of ships, and \$6,000,000 was appropriated for this purpose in addition to a specific appropriation for the construction of a \$1,000,000 structural shop at the Norfolk Navy Yard. This act provided for increasing the area of the Washington Navy Yard and for the construction of a \$600,000 gun shop therein; \$280,000 for the storage of guns and munitions at magazines, yards, and stations, and \$11,705,111 for the construction of a projectile plant and an armor plant. There was authorized, in addition, \$705,611 for the projectile plant. All of these projects were advanced as rapidly as possible.

CIVIL ENGINEER CORPS.

3. The Civil Engineer Corps, at the outbreak of the war, consisted of 41 regular officers. On June 15, 1917, 25 regular officers were appointed, and on January 11, 1918, 10 regular and 20 temporary officers were appointed, after which the corps was increased from time to time by the appointment of temporary and reserve officers until on the date of the armistice there were 74 regular officers, 20 temporary officers, and 110 reserve officers.

BUREAU FORCE.

4. The bureau force was inadequate and consisted of only 63 persons on July 1, 1916. By January 1, 1917, it had been increased to 116; on April 1 to 147; on September 1 to 307; and ultimately to 710 on the day of the armistice. The force carried on the bureau rolls was insufficient to carry on the work with sufficient expedition during the war period and the contracts were made with firms of architects, engineers, and inspectors, who furnished large numbers of their own employees for the work of the bureau.

5. At no time during the war did the bureau find it possible by means of direct employment and by contract to expedite the work as much as it desired, but it believes that every necessity was met. The belief is predicated largely upon the fact that rarely, if ever, was it found necessary to place higher than A-3 priority on any of its work, and generally the priority granted was A-5. It appears conclusive to the bureau that higher priorities would have been granted if the war conditions had been such as to make such priorities appear to be necessary.

BUREAU ORGANIZATION.

5. Under the chief of bureau there are four divisions—i. e., Design Division, Contract Division, Maintenance and Operating Division, and Clerical Division. The assistant to the chief of bureau has direct charge of the Design

Division, which is made up of various subdivisions under the direct charge of project managers, who are responsible for the design of and specifications for the work assigned them.

6. The project managers have charge of classes of work and are, respectively, managers of navy-yard development, dry docks, power-plant development, armor and projectile plants, ordnance plants, aviation, submarine bases, fuel, radio stations, hospitals, training camps, and marine stations.

7. The Contract Division has cognizance of all contracts; the Maintenance and Operating Division has charge of current expenditures for maintaining and operating the various yards and stations, and the securing and records of transportation equipment.

CONTRACTS.

8. During the first six months of the war period 62 contracts were awarded on the percentage basis, for the reason that time was an essential element, and the urgency of the case would not permit of preparing detailed plans before the work was undertaken. Information secured by the bureau before the declaration of war enabled the bureau to secure good contractors for this class of work, who cooperated fully with the bureau, and finished the projects quickly and at as reasonable a cost as could be expected.

9. Thereafter contracts were almost all based upon competition, the notable exceptions being the office buildings in Potomac Park, and the supply base at South Brooklyn, which were let on a fixed fee basis, and the camp at Detroit in connection with the construction of the Eagle boats, which was let on the percentage basis. Before January 1, 1918, over 500 contracts, representing approximately \$70,000,000, has been entered into, and during the period from April 6, 1917, to the day of the armistice—November 11, 1918—approximately 1,200 contracts, approximating \$200,000,000, had been entered into.

PLANT EXTENSIONS.

10. Forty-seven projects, the cost of which approximated \$70,000,000, were carried out under the supervision of the bureau. These projects consisted in extending plants and providing new plants to carry out the contracts for ship constructions, the most notable of which are the Squantum plant—erected to enable the Bethlehem Shipbuilding Co. to assemble destroyers, and the building of a new plant for the Erie Forge Co., to provide for shaft and other heavy forgings.

FUNDS AVAILABLE.

11. Direct appropriations of \$219,000,000, and allotments of \$127,000,000 from other funds were made available to cover the cost of the work carried out under the bureau, and, of this amount approximately \$335,000,000 were used used at home and \$11,000,000 abroad.

PUBLIC WORKS ABROAD.

12. The work consisted of the construction of aviation stations in England, Ireland, Italy, and France; fuel-oil stations in France; four hospitals in France and six in Great Britain; and 25 radio stations. Admiral Sims sent 521 cables that required action by the bureau and which required the preparation of 553 separate requisitions. Immediate attention was given to every request. Requisitions were immediately prepared for material to be purchased. The bids were carefully considered, with particular reference to time of delivery and suitability of material for rapid construction work. As soon as orders were placed, expeditors were given instructions to expedite the construction of the material and its shipment. The shipments were followed to tidewater and until each item had been placed aboard a vessel bound for the war zone. In addition to the routine report the bureau prepared special reports giving the data relative to shipment, and sent these reports directly to Admiral Sims. Projects that required plans were given precedence in the bureau, and every effort was made to secure the earliest possible delivery.

13. One of the most important projects was the erection of a high-power radio station in France that required eight steel towers, each 820 feet in height. Plans were prepared and the material purchased and shipped and delivered in France. The French Government decided to build the foundations for these towers, and

erection was somewhat delayed on account of the unreadiness of the foundation. The bureau had assembled a force of approximately 385 reserves who were qualified steel men, and who were enrolled for the special purpose of erecting these towers. At the time of the armistice approximately half of the steel—for four towers—had been erected. Work was suspended at that time and was later renewed under a contract for the completion of the erection of the eight towers.

14. Large demands were made upon the bureau for motor transportation for the several projects abroad, and during the war 727 trucks, 132 trailers, 289 passenger cars, and 237 motor cycles were shipped at Admiral Sims's request. One project called for 40 trucks of special construction, and the bureau was able to place an order for this lot to be manufactured and shipped within six weeks. Plans were changed, however, and trucks of an Army type were used.

15. The bureau is satisfied that every request of Admiral Sims that required action by the bureau was complied with without any loss of time; also that all material shipped abroad was the most suitable for the purposes stated that could be secured in the market.

NAVY YARD DEVELOPMENT.

16. The improving and equipping of navy yards and stations for the construction of vessels required the construction of a large number of industrial shop buildings, power plants, several shipbuilding slips, and storehouses. Also the acquirement of floating cranes and other weight-handling devices, and the improvements of water fronts by dredging and the building of quay walls and piers. These main improvements required a large extension of streets, railroads, and air, electric, water, and sewer systems.

DRY DOCKS.

17. At the outbreak of the war a large dry dock at Pearl Harbor was being constructed by the Navy Department, and large docks at Boston and San Francisco were being constructed by the Commonwealth of Massachusetts and the Bethlehem Shipbuilding Co., respectively. The Navy Department had made contracts for the use of these two docks. On April 30, 1917, the department contracted for another large dock at the Norfolk Navy Yard, and on April 25, 1917, contracted for a similar dock at the Philadelphia Navy Yard. Work was expedited on all of these docks and all are ready for use except the one at Philadelphia, which will probably be completed within the next year. All of these dry docks will accommodate the largest ships now built or building.

POWER PLANTS.

18. The improvement of navy yards required large extensions to the power plants at Portsmouth, Boston, New York, Philadelphia, Norfolk, Charleston, New Orleans, Mare Island, and Puget Sound. A large increase was also necessary at the torpedo factory at Newport, and the powder factory at Indianhead. Training camps and hospitals, both permanent and temporary, required large power-plant installations. In all, approximately \$18,000,000 were expended for this purpose.

NAVAL ACADEMY, ANNAPOLIS, MD.

19. The Naval Academy buildings were designed for 500 midshipmen, allowing a study room and two small bedrooms for each two men, but before the buildings were completed it was necessary to curtail the space for each man and the buildings were made to accommodate 1,200 men. Early in 1917 the necessity for training additional officers was apparent, and on July 13, 1917, a contract was awarded for the construction of two additional wings to Bancroft Hall, increasing the capacity to 2,400 midshipmen. The first appropriation was in the act of March 4, 1917, that carried an item of \$1,000,000. Subsequent acts have increased this to \$3,925,000.

20. The number of midshipmen taxed the facilities in the educational departments beyond their capacity and in the act of July 1, 1918, an item of \$1,000,000 was appropriated for the construction of a new seamanship and navigation building, which is now nearing completion.

OFFICE SPACE FOR NAVY DEPARTMENT.

21. At the outbreak of the war the personnel of the Navy Department was accommodated in a part of the State, War, and Navy Building and in the Navy Annex. June 30, 1916, there were 926 officers and employees in the Navy Department, which number was increased to approximately 8,000 at the time of the armistice. With the expansion of the force it became necessary to hire additional office space in buildings widely scattered in the city, and it was not even possible to get enough space in any one locality to keep a bureau force together. At one time the Bureau of Yards and Docks had its force located in five buildings, scattered from Twelfth and F Streets to Connecticut Avenue and Jefferson Place.

22. The deficiency act of March 28, 1918, carried an item for "temporary concrete office buildings, Navy and War Department," and, acting under this authority the Navy Department contracted on February 25, 1918, for two reinforced concrete buildings to be constructed in Potomac Park, fronting on B Street and extending westward from Seventeenth Street to Twenty-first Street. Each building consisted of a so-called "head house" 60 feet wide fronting on B Street, from which wings 60 feet wide and 500 feet long extended to the rear.

23. The Navy Department Building, with a head house 860 feet long, has nine wings, and the War Department Building, with head house 784 feet long, has eight wings. The total floor area is approximately 1,800,000 square feet, or more than 41 acres, and is sufficient for the accommodation of approximately 10,000 employees. These buildings were completely occupied for the transaction of business by the first week in October, 1918, at which time there were 7,191 persons installed in the Navy Building alone. At that time the Hydrographic Office, Allotment Office, Marines, and Library, had not been transferred to this building. Since that date all of the activities other than the Library have been transformed to the building, and the centralization of the forces in one building has materially facilitated the transaction of the business of the Navy Department.

GENERAL STORAGE.

24. At the outbreak of the war the storage facilities of the Navy were confined to the navy yards and naval stations, and were insufficient for the expansion of naval activities that immediately took place. A large amount of space was hired from private owners and new storehouses were constructed at navy yards. While the immediate needs were met in this way, the operation required larger expenditures than would have been the case if storage were conveniently located at the proper places. The urgent deficiency act of June 15, 1917, provided \$2,800,000 for the purchase and development of the area comprising what was known as the Jamestown Exposition site and adjacent territory at Hampton Roads. This site was selected as one of the most important for increased storage accommodations, and large storehouses were erected at this place.

25. Early in 1918 the department contracted for the construction of a very large supply base at South Brooklyn, N. Y. These supply bases have increased to a very great extent the economy of handling stores. During the war the storage capacity has been increased to about two and two-thirds times that existing at the outbreak of the war.

FUEL-OIL STORAGE.

26. At the outbreak of the war additional fuel-oil storage was under way at Melville, R. I.; Guantanamo, Cuba; Puget Sound, Wash.; and Pearl Harbor, Hawaii. Later, work was started at San Diego, Calif., and Yorktown, Va. Concrete underground tanks were being provided at all of these places, and the tanks have a capacity of 1,440,000 barrels.

27. In December, 1917, the bureau was requested to provide storage facilities for oil at a number of ports in France, and provided three 7,000-ton tanks, two 560-ton tanks, and one 150-ton gasoline tank for Brest, three 3,600-ton tanks at La Pallice, three at Furt, and three at L'Orient.

NAVAL OPERATING BASE, HAMPTON ROADS.

28. The Jamestown Exposition site above referred to has been developed for a fleet operating base and has removed from navy yards activities which were necessary in connection with the operation of the fleet, but which interfered

with the industrial activities of the yards. At the time of purchase the area of the land was approximately 474 acres and by diking and filling this area has been increased to approximately 800 acres.

29. The supply base above referred to is one of the most important elements of the operating base. One of the first uses made of this base was the establishment of a training camp of an ultimate capacity of 14,000 men. In connection with this training camp many special schools have been established.

30. A large area of the eastern part of the base has been assigned to aviation and a large and important aviation station has been developed thereon.

31. On the northwestern water front a submarine base with a capacity for 20 submarines has been established. Two large piers 1,400 feet long have been constructed and a third is now under construction. One of these piers forms the side of the submarine basin, but the southerly side is available for deep-draft ships so that the three piers will furnish 7,000 feet of berthing space for the largest vessels.

SUBMARINE BASE, NEW LONDON.

32. At the outbreak of the war the facilities for submarines were very restricted, and the naval station at New London was considered to be well located for care and operation of submarines. Plans were immediately prepared for converting this station into a submarine base. The water front was improved by the construction of a number of light piers for mooring space, and ashore the necessary shop facilities and housing facilities were provided. This base is sufficient for the convenient accommodation of 20 submarines.

ORDNANCE PROJECTS.

33. The principal public works on account of the Bureau of Ordnance were the increase of the Washington Navy Yard for gun production; the torpedo station at Newport for torpedoes; the armor and projectile plants at South Charleston, W. Va.; and mine plants at St. Juliens Creek and Yorktown, Ca.; and about 250 necessary buildings at naval magazines and ammunition depots.

RADIO STATIONS.

34. At the outbreak of the war commercial radio stations were taken over, but required considerable improvement which was immediately undertaken. Three large high-power radio stations were undertaken—one at Cayey, P. R., with three 600-foot towers; one at Annapolis, Mr., with four 600-foot towers; and one at Croix d'Hins, France, with eight 820-foot towers. The construction of these stations was expedited. Towers were erected at several of the older stations to increase their capacity, and a considerable number of steel radio towers was purchased for the Cuban Government. Radio compass stations have been built along the coast.

AVIATION.

35. At the outbreak of the war the only naval air station in the United States was at Pensacola, Fla. Coastal stations were started soon after the outbreak of the war and were extended as necessities arose. Several air stations were erected in Europe during the period of the war.

36. One of the largest undertakings during the war period was the establishment of the helium plant at Fort Worth, Tex., connected with the gas supply of Petrolia by a pipe line 104 miles long. This plant was not completed before the armistice.

37. The production of aircraft required shop facilities that were not in existence at the time of the declaration of war, and the necessary shops were constructed at the Philadelphia Navy Yard at a cost of approximately \$7,000,000.

TRAINING CAMPS.

38. Prior to the outbreak of the war there were four permanent naval training stations with facilities for approximately 6,000 men in training at a time. Recognizing the importance of preliminary training ashore, the department ordered immediate expansion of existing stations and the construction of others. Allotments were first made from the naval emergency fund in April, and estimates for additional appropriations were made to Congress. The largest expansion was at Great Lakes. Provision was, with the utmost speed, made for housing 97,200 men in sanitary, properly heated and ventilated buildings

located at 30 different places. Building was continued until quarters and auxiliary buildings were provided for 192,875 men in winter and 205,275 men in summer. Camps included barracks, mess halls, drill halls, swimming tanks, schools, and dispensaries.

39. In the earliest camps less floor space and less cubic feet of space per man was furnished than was desirable, and the later camps were improved in this respect until 42 square feet of floor space and 450 cubic feet of space were furnished per man. Based upon the earlier quantities, the camps would accommodate a very much larger number of men than above stated.

40. The cost of training camps constructed up to December 1, 1917, was approximately \$19,000,000, and the total cost of all camps that have been constructed is approximately \$59,000,000.

HOSPITALS.

41. Previous to the war period the Bureau of Yards and Docks had prepared tentative plans for emergency base hospitals and had outlined a method of procedure to utilize existing hospitals by expansion. The emergency act of June 15, 1917, contained an item of \$1,350,000 for hospital construction, and later acts provided \$15,000,045 for the same purpose.

42. Hospitals were provided at 23 places in the United States and at 13 places abroad. Over 200 portable buildings for hospital use were shipped from the United States and erected overseas.

43. Most of the temporary hospitals were of wood construction, but those at Brooklyn and Wards Island, N. Y., Philadelphia, Pa., and Norfolk, Va., and some at Charleston, S. C., were stuccoed.

MARINE CORPS PUBLIC WORKS.

44. Large training camps were constructed at Quantico, Va., and Parris Island, S. C., and a permanent base, which will cost approximately \$5,000,000, was started at San Diego, Calif.

DETAILED STATEMENT.

45. A more detailed statement of the project follows:

Plant extensions.—Early in 1917 it was found necessary, in order to meet emergency requirements for the expansion of the productive capacity of various privately owned plants, for the Navy Department to furnish financial assistance, directly or indirectly, for the construction of many new plants and additions to and extensions of existing plants. The necessary supervision and inspection of all such work, especially as to general efficiency of layout and arrangement of detail, was assigned to the Bureau of Yards and Docks in August, 1917. Some 45 different projects of this character, costing more than \$71,000,000, were carried through to successful completion under various contracts, as listed in the following table:

Plant.	Purpose of extension.	Approximate cost of extension.
Alabama Dry Dock & Shipbuilding Co., Mobile, Ala.	3 mine sweepers.....	\$60,434.53
Baltimore Dry Dock & Shipbuilding Co., Baltimore, Md.	7 mine sweepers.....	128,117.35
Bath Iron Works (Ltd.), Bath, Me.	11 destroyers.....	417,768.28
Chester Shipbuilding Co., Chester, Pa.	4 mine sweepers.....	105,662.65
Wm. Cramp & Sons, Steamship & Engine Building Co., Philadelphia, Pa. (other than Cramp plant).	Various vessels.....	4,404,210.98
Wellman, S. M., Co., Akron, Ohio.	Equipment for destroyers.....	1,246,748.98
De La Vergne Co., East Chicago, Ind.	Various vessels.....	1,500,000.00
Electric Boat Co., Groton, Conn.	Submarines.....	192,552.00
Ford Motor Co., Detroit, Mich.	100 Eagle boats.....	3,500,000.00
Ford Motor Co., Kearney, N. J.	do.....	2,000,000.00
Bethlehem Shipbuilding Corporation:		
Fore River, Mass.	Various vessels.....	2,796,820.32
Quincy, Mass.	Transportation improvement.....	494,000.00
Squantum, Mass.	35 destroyers.....	13,787,285.00
Buffalo, N. Y.	35 turbine sets for destroyers.....	2,907,000.00
Providence, R. I.	112 Yarrow boilers for destroyers.....	1,052,500.00
Worthington, P. & M. Co., East Cambridge.	150 sets pumps for destroyers.....	2,897,633.00
Falk Co., Milwaukee, Wis.	Gears for destroyers.....	800,000.00

Plant.	Purpose of extension.	Approximate cost of extension.
Sturtevant Co., Hyde Park, Mass.	Turbine sets for destroyers.	\$190,000.00
Edward Valve Co., East Chicago, Ind.	Valves.	140,000.00
Chapman Valve Co., Indian Orchard, Mass.	do.	20,000.00
Consolidated Manufacturing Co., Bridgeport.	Safety valves.	68,000.00
Gas Engine & Power Co., Morris Heights, N. Y.	5 mine sweepers.	156,253.92
Griscom Russel Co., Massillon, Ohio.	Equipment for destroyers.	325,000.00
Lake Torpedo Boat Co., Bridgeport, Conn.	12 submarines.	423,375.53
New Jersey Dry Dock & Transport Co., Elizabethport.	2 mine sweepers.	72,188.80
Newport News Shipbuilding & Dry Dock Co., Newport News, Va.	Various vessels.	9,323,773.00
New York Shipbuilding Corporation, Camden, N. J.	do.	4,043,773.44
Pennsylvania Shipbuilding Co., Gloucester, N. J.	2 mine sweepers.	14,971.82
Pusey & Jones Co., Wilmington, Del.	do.	7,563.75
Staten Island Shipbuilding Co., Staten Island, N. Y.	8 mine sweepers; 6 sea-going tugs.	1,175,370.14
Sun Shipbuilding Co., Chester, Pa.	3 mine sweepers.	8,230.60
Bethlehem Shipbuilding Corporation (Union):		
Potrero-Alameda, Calif.	Various vessels.	1,668,010.12
Potrero-Alameda and Risdon, Calif.	do.	2,668,800.00
Columbia Steel Co., Pittsburg, Calif.	do.	135,000.00
Alloy Steel Forging Co., Carnegie, Pa.	4-inch gun forgings.	375,111.51
Chesapeake & Ohio R. R. Co., Newport News, Va.	Coal storage.	324,800.00
Inland Ordnance Co., Bedford, Ohio.	Gun forgings.	210,771.00
Poole & E. M. Co., Woodberry, Md.	500 4-inch guns.	535,360.00
Walter Scott Co., Plainfield, N. J.	250 antiaircraft gun mounts.	159,810.39
Tioza Steel & Iron Co., Philadelphia, Pa.	Gun forgings.	1,800,000.00
Virginian Ry. Co., Sewalls Point, Va.	Coal storage.	382,254.00
Lang Products Co., Whitestone, Long Island.	Airplane propellers.	229,385.65
Erie Forge Co., Erie, Pa.	4-inch gun forgings.	7,700,998.00
Allis-Chalmers Co., Milwaukee, Wis.	Rotor drums and destroyer shafting.	557,106.00
Pollock Steel Co., Cincinnati, Ohio.	Gun forgings.	732,600.00

Thirty-four of the foregoing plants were engaged in the construction of torpedo-boat destroyers, scout cruisers, submarines, mine sweepers, and accessories for these vessels, and of the Eagle boats built by the Ford Motor Co.; two have provided for the storage of coal, one for the production of airplane propellers, and eight for the production of shafting and ordnance material. Many of the above plants were substantially completed and used in the calendar year 1917, and practically all of them were in successful operation before the expiration of the fiscal year 1917-1918. The two largest plants were the torpedo-destroyer plant at Squantum, near Quincy, Mass., costing nearly \$14,000,000, and the Erie Forge Co. plant, at Erie, Pa., costing nearly \$8,000,000.

Squantum plant.—The plant proper occupies about 97 acres of land at the north end of a tract of 700 acres commanded by the Navy Department, located about 5 miles north of Quincy, at the mouth of the Neponset River. The plant consists of a fabricating and assembling shop, with 10 building slips under roof and 6 wet berths, also under roof, and the necessary auxiliary shops, storehouse, wharf, wet basin, launching ways, railroad tracks, streets, street railway connections, etc. The plant is adapted to the rapid construction of light-draft hulls and the installation of the machinery and fittings for such vessels. It is entirely Navy owned. This plant was authorized October 6, 1917; construction work began immediately and progressed during a winter of extreme severity. The fabrication of the ship work by the Bethlehem Shipbuilding Co. (Ltd.) began at the plant in January, 1918; five keels were laid in April, 1918; the first boat was launched in July, and delivered to the Navy on November 30, 1918. The plant was substantially completed in May, 1918, seven months after it was authorized. Up to May 1, 1920, 35 destroyers have been built and launched at this yard by the Bethlehem Shipbuilding Co. (Ltd.), of which 33 are entirely completed at this date, and it is expected that this plant will be turned over to the Navy Department very shortly.

Erie Forge Co.—This plant, located at Erie, Pa., is designed for the manufacture of 4-inch gun forgings, rotor drums, and destroyer shafting, and contracts with the Navy Department called for the production by the Erie Forge Co. of 7,500,000 pounds of forgings and 7,500,000 pounds of drums and destroyer shafting. The plant cost approximately \$7,700,000. Work was started early in November, 1917. The extension consists of four main buildings, as

follows: Open hearth building, 171 by 280 feet; forge shop, 201 feet 5 inches by 364 feet; machine shop, 194 feet 8 inches by 360 feet; heat treatment building, 67 feet 3 inches by 336 feet. There are also a number of miscellaneous buildings, including substation, boiler house, administration building, chemical laboratory, physical laboratory, office building, etc. The open hearth department includes in its equipment two 50-ton furnaces with all accessories. Rapid progress was made on this plant extension, and it was substantially completed and in operation by the Erie Forge Co. before the expiration of the fiscal year 1917-18.

Industrial shop buildings.—There are about 70 permanent buildings of the most modern design. Some of the most interesting are the structural shop at Norfolk, 700 by 300 feet, cost \$1,677,000, contract dated October 12, 1916; same at Philadelphia, cost \$1,883,000, contract dated March 10, 1917; structural shop at New York, 579 by 203 feet, cost \$1,380,000, contract dated July 5, 1917; and one at Mare Island, 699 by 300 feet, now under way, is estimated at \$2,215,000, including auxiliary improvements; machine shop at Norfolk, 600 by 133 feet, cost \$936,000; and machine shop at Philadelphia, 328 by 133 feet, cost \$671,500. These machine shops have 150-ton traveling bridge cranes with hook height of about 70 feet.

The main machine shops at Mare Island and New York were extended and at New York a six-story light machine shop, 94 by 392 feet, costing about \$1,000,000 has been constructed. Modern foundries constructed at Norfolk and Philadelphia cost \$841,000 and \$1,148,000, and were 410 by 180 feet and 650 by 180 feet, respectively. These are equipped with cranes varying in capacity from 5-ton wall cranes to 80-ton bridge cranes. A galvanizing plant 122 by 62 feet was constructed at Philadelphia, and oxyacetylene plants at Philadelphia, Norfolk, and Mare Island. Another oxyacetylene plant is under construction at Charleston, S. C. Miscellaneous small buildings have been constructed at the different yards. Reinforced concrete pattern shops are under construction at Philadelphia and Norfolk.

Shipbuilding slips cover, for Philadelphia, two slips costing \$2,659,000, with runways, cranes, and facilities for 850-foot battle cruisers; for Norfolk, one slip costing \$1,100,000, for 700-foot battleships; for New York, two concrete slips costing \$3,000,000, for 700-foot battleships, one of which, a reconstruction of old slip, is still underway; for Mare Island the reconstruction of old slip for maximum battleship; and for Puget Sound a novel slip costing \$1,056,000 with cranes was constructed, taking advantage of the great tidal variation existing at that yard. This latter slip consists of a shallow dry-dock 900 feet long, 130 feet wide at coping, and with 18 feet of water over blocks at mean high tide. The dock has the advantage of permitting construction of a ship on a level keel, and the ordinary launching risk is eliminated, as ships are launched by flooding dock and floating ship in place. The dock has another advantage in that it may be used as a dry-dock for shallow-draft craft when not needed for ship construction. Other slips constructed are ways for the construction of four submarines under cover at Portsmouth, four destroyer slips at Charleston, S. C., two destroyer ways at Mare Island, ways for two mine sweepers at Puget Sound, two mine-sweeper ways at Philadelphia. At Boston the old slip was extended to take the largest size of supply ship.

Exterior weight-handling devices required were extremely varied in capacity and characteristics to suit the different conditions. The fixed hammerhead crane located on the fitting-out pier at Philadelphia, costing \$875,000 exclusive of foundations, has many interesting features. Its capacity is 350 gross tons at a reach of 115 feet, with a hook height of 145 feet above water. The auxiliary hook has a capacity of 50 gross tons at a reach of 190 feet. On test, this crane lifted on all hooks about 1,010,000 pounds. The shipways at Philadelphia, Norfolk, and New York are designed for two 40-ton cranes of about 150-foot span and four 10-ton cranes of 65 and 78 foot spans on each shipway. The hook height of the 40-ton cranes is about 135 feet above water level. The dock-type shipways constructed at Puget Sound have four revolving and traveling hammerhead cranes of 20-ton capacity at reach of 50 feet and 15 tons at 85 feet with hook height of 105 feet above bottom of dock. Smaller shipways are, in general, equipped with fixed-position revolving hammerhead cranes of 5 and 10 ton capacity at varying heights. Steel storage and bulkhead construction areas were, in general, designed for overhead traveling cranes varying from 5 to 15 ton capacity. Smaller fitting-out cranes of 5 and 10 ton capacity, either fixed or traveling and of the revolving hammerhead type, are either completed or

underway. In addition, five traveling dry-dock cranes of 50-ton capacity, all of the revolving jib type, were contracted for and are nearing completion. These cranes are located two at Philadelphia, one each at Norfolk, New York, and Pearl Harbor.

Floating cranes of 150 gross ton capacity of the revolving-jib type were completed at Norfolk and Mare Island. The Norfolk crane cost about \$360,000; the Mare Island crane, contracted for 16 months later, cost \$700,000.

Water-front construction at Philadelphia included a fitting-out pier, 1,000 feet long by 100 feet wide, at a cost of \$870,000. The fitting-out pier at Norfolk is of concrete sheet-pile construction and will cost \$1,254,000, both exclusive of cranes. The fitting-out pier at Portsmouth was extended 250 feet. The two merchandise piers at Hampton Roads are 1,400 feet long and 125 feet wide. Ten piers, 350 by 20 feet, were constructed at Hampton Roads for submarines. A concrete wharf 1,010 feet long was completed at Pearl Harbor, and also three concrete torpedo-boat piers. Concrete pier and quay wall were constructed at Pensacola and piers and walls constructed at other stations.

Dredging projects covered work at Norfolk, Hampton Roads, Philadelphia, Charleston, Mare Island, with minor work at other stations. At Hampton Roads about 8,000,000 yards were handled.

Marine railways at Boston and Charleston were constructed of 2,000-ton capacity at cost of about \$180,000 each. Foundations for marine railway of same capacity were constructed at Pearl Harbor, and the construction of a marine railway at San Diego was stopped pending change of site. Small marine railway was constructed at Cape May, and others purchased for installation at Great Lakes and Newport.

The Pearl Harbor Dry Dock was formally put in operation on August 21, 1919, after 10 years and 1 month of laborious effort. This structure, as completed under the final design, is 1,000 feet long, 114 feet wide at the blocking level, and 32 feet 6 inches in effective depth. These dimensions are ample to take care of the largest fighting craft now in existence or contemplated, and the overcoming of the difficulties involved in the dock's construction is a matter of historical interest and a source of great pride to the service.

Dry Dock No. 4 at Norfolk was opened on April 1 to receive the battleship *Wisconsin*, having been in course of construction only since November 6, 1916. This dock is 1,005 feet long in the clear, 118 feet wide at blocks, and 40 feet in effective depth. All mechanical accessories are now in working order. The total expenditure represented is approximately \$4,500,000.

The Commonwealth Dry Dock at Boston, which is 1,170 feet long, 125 feet wide, and 43 feet deep, has been acquired by the Navy Department, acting under the authority of the act of October 17, 1918, which carried an appropriation of \$4,550,000 of this purpose.

The Hunters Point Dock at San Francisco is the largest dock on the Pacific coast, having been completed by its owners, the Union Iron Works, in October, 1918. Its dimensions are 1,007 by 115 by 37½ feet, making it fully capable of receiving the largest ships afloat. By the terms of the act of June 30, 1914, the Navy has priority of docking rights in this dock during war time, with an annual rental arrangement to cover peace-time requirements. The dock is excavated from the solid rock, has a concrete lining, and is fully equipped with modern accessories.

Power plant, Naval Academy, Annapolis, Md.—The increase in the number of midshipmen, the extension of Bancroft Hall, and the addition of other buildings at the academy has necessitated a considerable enlargement in the power plant. Additional power-plant equipment installed consisted of two turbogenerators—one 750 direct current to furnish electrical energy to the Naval Academy proper, and one 100-kilowatt alternating-current generator, to furnish additional energy to meet the increased needs of the hospital. One additional boiler was installed in the boiler room and the mechanical stokers on seven old boilers, which were of an old type, from which insufficient boiler capacity could be obtained, were replaced by modern stokers of the forced-draft, underfeed type, which have permitted the old boilers to be operated at considerable overloads.

At a subsequent date, it was found necessary to increase the boiler capacity by the addition of three 400-horsepower boilers installed in an addition to the boiler room.

The changes above outlined have involved an approximate expenditure of \$530,000.

Power plant, navy yard, Boston, Mass.—The increase in the activities at this yard has necessitated considerable extension of the power-plant equipment.

These additions consist, in general, of a 3,750 K. V. A. turbo generator with condenser, auxiliaries, piping, etc.; four 600-horsepower boilers with forced draft, underfeed stokers, foundations, piping, fans, heaters, etc. The air compressor equipment has been increased by the addition of two 2,500 cubic feet per minute and one 5,600 cubic feet per minute reciprocating air compressors, the installation of the last machine requiring an extension to the engine room. New coal weighers have been installed in the boiler room; also, a modern system of conveying ashes from the boilers to an elevated tank outside of the building.

Approximately \$300,000 has been spent on power-plant improvements at this yard.

Power plant, navy yard, Charleston, S. C.—The original power plant at this yard was constructed in 1908 and no additions were made to this equipment until about three years ago, at which time the electrical generating capacity was increased 100 per cent by the addition of a 1,250 K. V. A. turbo generator and an additional battery of 350-horsepower boilers was added to supply the increased steam demands. About this same time the air compressor capacity, originally 2,400 cubic feet per minute in reciprocating compressors, was increased by 5,000 cubic feet per minute turbo air compressor, which more than doubled the former capacity. The latest additions consisted of a 2,500 K. V. A. turbo generator and two 600-horsepower boilers.

About \$800,000 has been spent on boiler plant work at the naval operating base.

Power plant, powder factory, Indianhead, Md.—The increased production of powder at Indianhead in recent years has necessitated large extensions to the power plant. The original electrical generating equipment consisted of three 625 K. V. A. turbo generators. This equipment has been augmented by one 1,875 K. V. A., one 3,750 K. V. A., and one 7,500 K. V. A. turbo generator. The boiler capacity has been increased, first, by two 600-horsepower boilers and, at a later date, the small boilers on one side of the boiler room were removed and replaced with four 1,000-horsepower units, each capable of operating at 300 per cent of rating, so that the boiler capacity originally installed has been more than doubled. Other additions which have been made are a large cooling tower, a spray cooling pond, necessary condensers, pumps, foundations, piping, etc. A small extension to the boiler room was necessary to house additional boilers and a considerable extension to the engine room was made for the two larger turbo generators above mentioned, rotary converters, excitors, and a new switchboard.

Approximately \$1,000,000 has been expended for these improvements to the power plant.

Power plant, navy yard, Mare Island, Calif.—Considerable power-plant equipment has been added at this yard to meet the increased demands for light, heat, and power. The additions consist, in general, of one 3,750 K. V. A. turbo generator; one 5,000 K. V. A. turbo generator; one 8,000 cubic feet per minute turbo air compressor, and one 1,000-horsepower boiler. These additions require extensive piping changes as well as foundations, condensers, pumps, tanks, heaters, and other auxiliaries.

Approximately \$400,000 has been expended for this power plant work.

Power plant, submarine base, New London, Conn.—A complete new power house has been constructed to serve the needs of this new development. The initial equipment is three 1,875 K. V. A. turbo generators, three 823-horsepower water-tube boilers with all auxiliaries such as heaters, pumps, tanks, piping, switchboard, excitors, air compressors, etc. This project also includes the installation of large storage tanks for fuel oil required for the operation of the boilers in the central power plant, also tanks for the storage of Diesel oil used by submarines, with a complete piping system for handling these oils between the storage tanks, power house, and the different piers at which the submarines are berthed. There have also been included underground distributing systems for fresh water, salt water, air, fuel oil, Diesel oil, hot water, and electricity from the power plant to the various buildings, shops, and piers.

Power plant, torpedo station, Newport, R. I.—With the rapid expansion of the activities of the torpedo station in 1917, it was decided to construct an entire new power plant rather than to attempt to expand the old power plant, which contained obsolete equipment, was located in such a position that an extension would have been difficult and because the power plant building was located in such a position that it could better be utilized as a manufacturing

building than as a power plant. A new power plant was constructed in a more advantageous location and the equipment consists, in general, of two 2500 K. V. A. turbo generators with four 500-horsepower boilers and all necessary auxiliaries. The old power plant generated direct current, but to conform to modern navy yard practice the design of the new power plant called for alternating current generating equipment. It was therefore necessary to purchase rotary converters to obtain the necessary direct current for operating old motors in the shop. New motors which have been purchased subsequently are, of course, of the alternating current type, in order that the electrical energy generated may be used direct without conversion.

In connection with the new power plant at the torpedo station, there has been included an extensive distributing system for light, heat, and power from the plant to the various buildings and shops; also, a complete coal and ash-handling plant for the storage and handling of coal from barges to ground storage or direct to the bunkers of the power house, and also for the rapid disposal of ashes.

This complete installation involved an expenditure of \$1,850,000.

Power plant, naval station, New Orleans, La.—An entirely new power plant was constructed at this station, with the exception of the building which had been previously built. The equipment installed consists, in general, of two 625 K. V. A. turbo alternators with boiler equipment, part of which was new and part transferred from the old power plant; also a 3,000 cubic feet per minute air compressor with necessary auxiliaries, consisting of condensers, pumps, fans, heats, piping, etc. This plant is arranged for burning fuel oil.

Approximately \$275,000 has been expended on this project.

Power plant, navy yard, New York, N. Y.—New power plant equipment has been installed as follows: One 2,500 K. V. A. turbo generator, one 8,000 cubic feet per minute air compressor, four 600-horsepower boilers.

The first two items were installed without extending the power plant building. As there was no room in the boiler room, however, for additional boilers to meet the increased steam demands, it was necessary to build an extension to the building. The usual auxiliaries were furnished for this equipment, consisting of condensers, pumps, heaters, tanks, piping and stokers, fans, stack, etc.

On account of the importance of continuing electrical service at this yard it was considered desirable to install an auxiliary connection with the Public Service Co. Frequency changers were therefore installed in a substation at some distance from the main power plant and arrangements were made so that the outside supply of electrical energy could be switched to the main switchboard in the central power plant at any time in case of accident to any unit, or to supply temporary abnormal power demands. The installation of the above-named equipment has involved an expenditure of about \$750,000.

Power plant, naval station, Pearl Harbor, Hawaii.—New equipment which has been purchased for installation in the central power plant at this station consists of a 2,500 K. V. A. turbogenerator, a 3,000 cubic feet per minute reciprocating air compressor and a battery of two 600-horsepower water-tube boilers with the usual auxiliaries, consisting of pumps, heaters, tanks, fans, piping, etc. It was found necessary to increase the length of the boiler room for the installation of the new boilers, but the other items of equipment were installed in the present engine room.

Approximately \$200,000 has been expended for these improvements.

Power plant, naval air station, Pensacola, Fla.—Considerable increase has been made in the power plant at the air station, Pensacola. On account of limited appropriation, however, it was necessary to transfer used equipment from other yards and, in addition, arrangements were made with the Bureau of Ordnance for the transfer without expenditure of funds by this bureau of certain generating equipment originally installed in the war plant of the American Radiator Co., at Bayonne, N. J.

This turbogenerator was 750 kilowatt, complete with condensers, pumps, and other auxiliaries. A 500-kilowatt turbogenerator with auxiliaries was transferred from the navy yard, New York, and certain other auxiliaries were transferred from the navy yard, Norfolk. All of these additions converted the original plant from a direct-current generating plant containing small and inefficient apparatus to an alternating-current plant with modern turbogenerators and auxiliaries; also, considerable improvements were effected in the boiler room.

Approximately \$100,000 was expended for this work.

Power plant, navy yard, Portsmouth, N. H.—The capacity of the power plant has been increased by two 1,000-kilowatt direct-current turbogenerators and a 5,000-cubic-feet-per-minute turboair compressor with necessary foundations, condensers, pumps, tanks, heaters, piping and other auxiliaries. All of this equipment has been installed without any extension to the building. The switchboard has been completely rebuilt and transferred to the gallery above the engine-room floor, in order to provide additional room for the installation of certain of the new units. On account of the small size of the circulating loop furnishing condensing water to the power plant, an entirely new loop of adequate size for present and future requirements was constructed.

Approximately \$350,000 has been expended for these improvements.

Power plant, navy yard, Puget Sound, Wash.—Power-plant improvements which have been effected within the past three years consist of the addition of one 3,750 K. V. A. turbogenerator, two 600-horsepower oil-burning water-tube boilers, and a 6,500 cubic feet per minute reciprocating air compressor, with the usual complement of auxiliaries, including foundations, condensers, pumps, heaters, piping, etc. To supplement the electrical energy required, this yard purchased a considerable amount of current from the Public Utility Co. at very advantageous rates, on account of the fact that the electricity comes from hydro-electric sources.

These improvements require an expenditure of approximately \$350,000.

Power plant, navy yard, Washington, D. C.—The power plant at this yard has been largely increased, and the equipment which has been installed is of a totally different character from the old apparatus. The latter consists of vertical, engine-driven, direct-current generators, while the new equipment consists of three 4,000 K. V. A. alternating current turbo-generators with necessary auxiliaries, such as condensers, pumps, piping, switchboard, exciters, rotary converters, motor-generator sets, etc. The boiler-plant capacity was increased first by the replacing of the old stokers under the 300-horsepower boilers with modern, forced draft, underfeed stokers; also by the recent addition of two 1,000-horsepower boilers in an extension to the boiler-plant building. Practically all of the equipment installed, except the new boilers, was originally manufactured for the central heating and lighting plant which was to have been installed by the Treasury Department to serve all of the various Government buildings in Washington. On account of the delay in the progress on this project, however, the Navy Department made arrangements with the Treasury Department to divert practically all of this material to meet the urgent needs at the Washington yard. This equipment, therefore, was made available and considerable time was saved over that which would have been required had it been necessary to manufacture this equipment.

On account of the importance of continuity of service at this yard, it was considered desirable to install an auxiliary electrical connection with the power plant serving the Capitol. Frequency changers, therefore, were installed in the substation at some distance from the main power plant, and arrangements made so that the outside supply of electrical energy could be switched to the main switchboard in the central power plant at any time in case of accident to any unit, or to take care of temporary abnormal power demands. It was necessary to install frequency changers in this case because of the fact that the characteristics of electrical energy generated at the Capitol power plant are different from the electrical energy generated at the navy yard, which is standard Navy practice of 2,300 volts, 3-phase, 60 cycles.

The changes above outlined have involved an approximate expenditure of \$1,500,000.

Power plants, navy yards, Norfolk, Va., and Philadelphia, Pa.—The largest plants constructed were the new central power plants at the navy yards at Norfolk, Va., and Philadelphia, Pa., where studies showed that the expected increase in power demands would warrant the construction of entirely new and complete plants, designed along the lines of modern practice, and equipped with power-generating apparatus of high efficiency. In each of these plants provision has been made for the installation of 15,000 K. V. A. in electrical generating apparatus, 20,000 cubic feet per minute air compressor capacity, and 9,600 horsepower for boilers at normal rating, with the necessary auxiliaries for the operation of such stations. The cost of each of these projects was about \$3,500,000.

Power plants, training camps.—Power developments for many of the first training camps constructed did not necessitate the construction of independent

power plants, as it was found feasible to increase the capacity of existing facilities. At the Naval Training Station at Great Lakes, however, the great increase in activity resulted in the necessity of obtaining increased plant capacity in the shortest time possible and it became necessary to purchase whatever boilers were available and install them in about 40 boiler houses located at different points on the station where the steam distributing lines would be of minimum length. Electrical energy required was purchased from the public utility company. (Have no record of costs at Great Lakes as project handled by station.)

A new power plant was constructed to serve the enlarged training station at Coasters Harbor Island, Newport. This involved a power plant building with 1,400 K. V. A. capacity in turbo-generators and 2,000 horsepower in boilers. This was made an oil-burning plant, at the request of the Bureau of Navigation, who desired to provide facilities for the instruction of apprentices of the same general character as those which they would handle subsequently on board ships. There were also included in the power plant contract the complete underground distributing systems for light, heat, and power from the plant to the barracks, and also the heating system in each building of the new camp. During the progress of the work it was decided to construct a camp for reserves at Cloyne Field, and a smaller boiler house, with equipment, and the heating and distributing system for this camp were included in the original contract. This entire project involved an expenditure of about \$1,300,000.

When it became evident that the Newport Training Station would require a further enlargement to provide for the rapidly increasing demands for training personnel it was decided to construct another camp at Coddington Point, on the mainland, opposite the original camp. On account of the area included in this development three boiler houses were constructed and a refrigerating plant. The contract for this work also included the complete mechanical equipment of the camp with steam and return mains from the boiler houses to the various camp buildings.

This project was considerably curtailed after the armistice by the omission of certain buildings. The contract for the boiler plants, heating system, and refrigerating plant involved about \$1,250,000.

Another large training station was constructed at Pelham Bay Park, N. Y., the mechanical equipment of which consisted of two boiler plants and the heating system of the camp buildings with necessary interconnecting steam mains. Electrical energy for this camp was purchased from the public utility company. (No record of cost as our section did not handle.)

As at Newport, two training camps were built at the naval operating base, Hampton Roads, Va. The original camp required a boiler house of 3,000 horsepower capacity with steam-distributing mains mostly carried overhead on poles from the boiler plant to the various buildings for heating, laundry, and sterilizing purposes.

The second camp, known as East Camp, required a boiler house of 4,000 horsepower capacity with steam-supply mains carried overhead on poles and return mains of much smaller size in the ground. There were also included the heating system in each of the camp buildings. This was said to be the largest single heating contract ever awarded in this country and involved an expenditure of about \$1,000,000.

Storehouses to the number of over 100 were constructed and of these about 27 were large and permanent. Some of the most interesting being for Boston, 184 by 144 feet of 10 and 8 stories at cost of \$1,640,000; Philadelphia, 363 by 183 feet of 8 stories cost \$1,196,000; South Brooklyn, 2 buildings each 200 by 800 feet of 8 stories, 1 U-shaped, the other solid, at cost of \$5,400,000; cold-storage plant at Hampton Roads, 267 by 118 feet of 4 stories at cost of \$755,000; a 6-story building 118 by 442 feet, a 3-story building 170 by 938 feet, and a 1-story building 170 by 615 feet, also at Hampton Roads, will cost \$900,000, \$1,260,000 and \$450,000, respectively.

Emergency coal-storage plants were constructed at Boston, New York, and Charleston. The New York plant, located at Constable Hook, had a capacity of 700,000 tons of coal and cost \$1,087,000. The Charleston, S. C., plant capacity was 120,000 tons and cost \$271,000. The Boston plant was for 52,000 tons and cost \$243,000. Bunkering depots were constructed at Hoboken and Lamberts Point and Newport News at a combined cost of \$471,000. A plant of 190,000-tons capacity was started at Baltimore, but construction was canceled before work was completed, the amount expended towards this work was \$176,000.

Fuel oil.—*Naval fuel oil station, Yorktown, Va.*—This station is a main fuel oil base for the Navy, and it has been constructed at a point where no improvements existed, a tract of land having been secured which offered natural advantages as to topography, frontage on deep water and location. Storage for fuel is provided in eight reinforced concrete reservoirs, placed underground, each having a capacity of 3,750,000 gallons. A power plant was constructed and pipe lines for steam and oil laid from it to the reservoirs, where the equipment for pumping oil from them is located. A wharf was constructed and the pumping plant for taking oil from tankers and transferring it to the reservoirs located on it.

Naval Gun Factory and navy yard, Washington, D. C.—The scope of the activities of the Naval Gun Factory was practically doubled during the war. To permit the carrying out of these increased activities, old buildings were extended and new industrial and storage buildings were constructed at a cost of approximately \$7,000,000, involving 55 contracts, for which plans and specifications were prepared by the bureau. The expansion of the Naval Gun Factory made necessary the acquisition of additional land to the eastward and westward, which increased the area of the former reservation 70 per cent.

The gun shop constructed at the Washington Navy Yard has three 300-gross-ton travelling cranes and the bureau knows of no other bridge cranes of as great capacity. The highest cranes have a hook height of 100 feet from the floor. The shrinkage pit has 10 compartments and is 100 feet deep below floor. It is designed for 20-inch guns. The shop is 567 by 240 feet and cost \$1,475,000.

Naval proving ground and smokeless powder factory, Indianhead, Md.—In carrying out the program to increase the output of smokeless powder from 20,000 pounds per day to 100,000 pounds per day, the bureau prepared plans and specifications and awarded contracts for some 60 public-works construction projects, at the naval proving ground and smokeless powder factory, Indianhead, Md., involving buildings for the various processes in the powder manufacture and the storage of powder-making materials, the construction of buildings for use as quarters for officers and employees of the station, the construction of docking and coal handling facilities, the increase of fresh water supply by 1,500,000 gallons per day, the construction of concrete roads and walks through the main thoroughfares, a large increase in the capacity of the power plant including the installation of additional boilers and turbogenerators, an extension of the water, sewer, steam, fire protection and electrical distribution system, the extension of the railroad facilities within the reservation and the construction of approximately 13 miles of standard-gauge railroad connecting the proving ground with the Popes Creek branch of the Pennsylvania Railroad at White Plain, Md.

It is estimated that the cost of the work performed during the period of the war; that is, to November, 1918, was \$5,000,000, and that the completion of projects started during the war, but since completed, involve an additional expenditure of \$2,000,000.

Naval ammunition depots.—The facilities for filling, issuing, and storing ammunition were greatly increased at the naval ammunition depots at Hingham, Mass.; New London, Conn.; Iona Island, N. Y.; Lafayette, N. Y.; Lake Denmark, N. J.; Fort Mifflin, Pa.; St. Juliens Creek, Va.; Charleston, S. C.; Pensacola, Fla.; New Orleans, La.; Mare Island, Calif.; Puget Sound, Wash.; Guantanamo, Cuba; and Kuaahua, Hawaii. The available storage space for gun parts and miscellaneous ordnance supplies at Bellevue, D. C., was extended. Quarters and sanitary and recreative facilities were provided to care for increased personnel at ammunition depots.

The designs of magazines, shell houses, filling houses, subsurface magazines, ordnance storehouses, and other structures, were standardized to as great an extent as was feasible, in order to expedite the preparation of estimates, plans, and specifications.

It is estimated that new construction at ammunition depots which was completed or started during the war period cost \$11,000,000.

Naval torpedo stations.—The acceleration of torpedo construction by the Bureau of Ordnance made necessary the provision of additional assembly and storage facilities. The storage available on shore was increased from approximately 2,000 to 7,000 torpedoes, at a cost of about \$900,000. New torpedo storehouses were built, or the construction started, at New London, Conn.; Newport, R. I.; St. Juliens Creek, Va.; Charleston, S. C.; Pensacola, Fla.; Coco Solo, Canal Zone; Keyport, Wash.; Alexandria, Va.; and Mare Island, Calif.

A new torpedo assembly plant was built at Alexandria, Va., at a cost of \$1,300,000, with a normal assembling capacity of two torpedoes per day and a maximum capacity of eight per day. Facilities for torpedo assembly were increased at the naval gun factory and the naval torpedo station, Newport, R. I.

Mine filling and mine storage depots.—For the purpose of filling mines with their charges of T. N. T., a mine-filling plant was constructed at St. Juliens Creek, Va., with a designed capacity to fill 1,000 mines per day with a charge of 300 pounds of T. N. T. A maximum output of 1,500 per day was attained. The plant, with accessory items, cost \$575,000.

To effect the distribution of the loaded mines, storehouses were built at Lake Denmark, N. J.; Iona Island, N. Y.; Newport, R. I.; St. Juliens Creek, Va.; Hingham, Mass.; Pensacola, Fla.; Guantanamo, Cuba; and Kuahua, Hawaii, with a total capacity of 22,000 mines, at a cost of \$800,000.

A reservation of approximately 11,400 acres near Yorktown, Va., was commandeered for the establishment of the Navy mine depot. A mine-filling plant has been constructed, similar to the one at St. Juliens Creek, and other buildings have been constructed for the storage of explosives, empty and loaded mines and mine parts. Buildings are under construction to provide quarters for enlisted and commissioned personnel, and facilities for carrying on the industrial and administrative activities.

The development of the Navy mine depot has included the construction of a standard-gauge railroad 10 miles long, a concrete highway $4\frac{1}{2}$ miles long, a power line, and other industrial and sanitary facilities.

The total cost of the development of the Navy mine depot has been about \$2,750,000, exclusive of the cost of the land.

United States naval projectile plant.—A naval projectile plant was built at Charleston, W. Va., upon a site donated by the citizens to the Navy for the purpose of building an armor plant at that place. The total appropriation was over \$2,000,000, of which \$910,000 were allotted to the Bureau of Yards and Docks for public works construction.

Three main buildings of the most modern type were designed at the Bureau of Yards and Docks, and were constructed during the fall of 1917 and spring of 1918. Though built under war conditions, the buildings are models as to their general arrangement, lighting, and character of construction. Railroad connections with the main line were also built.

United States naval armor plant.—An appropriation of over \$11,000,000 was made available for construction of a plant for manufacture of armor for naval vessels. During the war it was also decided to include in this plant provisions for manufacturing the forgings for the largest naval guns. The location selected by the department was at Charleston, W. Va., on the site donated for the purpose by the citizens. Studies and plans proceeded to a limited extent during the war. The immediate importance of other activities, however, did not permit active work to proceed until the middle of 1918. The designs were sufficiently far advanced to allow construction work to begin in the fall of 1918. The arrangement of the buildings and the plant in general is superior to any other American armor manufacturing plant, and is probably superior to any plant of its kind in the world. The largest capacities for handling of ingots, plates, and guns have been provided for.

Due to unsatisfactory experience with cost-plus contracts and due to the unstable market conditions existing in the fall of 1918 it was decided to build this plant by day labor, making contracts only for such items as structural steel, steel sash, and other specialties. The plant will probably be operating actively early in 1921. It is fortunate that this plant has been provided, because the armor-producing capacity of the country is not sufficient to provide for the battleship program already laid down.

The buildings comprise an open-hearth plant, with three open-hearth and two electric furnaces. This open-hearth plant will be equal in the efficiency of its arrangements to any in the country. It has been entirely designed in the Navy. The forge and furnace building contains the large forging presses and the heat-treatment furnaces. The machine shop contained the heavy machine tools for the work on armor plate and heavy gun forgings. The machine-shop building is one of the largest of its type in existence, being 700 feet long by 318 feet wide. The lighting and crane arrangements are unusually good. The heat-treatment building for guns contains cranes and a heat-treatment pit over 50 feet deep.

The railroad track system is unusually well laid out and will favor economical operation of the plant. The total amount of structural steel in the buildings is approximately 21,500 tons. The open-hearth cranes are of 250 tons capacity, adapted for handling hot metal. The other equipment of the plant is all of proportionate large capacity.

Lafayette Radio Station.—The eight steel towers at the Lafayette Radio Station, which is about 15 miles southwest of the city of Bordeaux, were designed in the bureau, and all structural steel purchased in this country and shipped abroad. The towers are arranged in two parallel lines, four towers on each side, spaced 1,312 feet on centers longitudinally and transversely, the distance from end to end of each line of towers being three-fourths of a mile. Each tower is triangular in plan, 820 feet high and 220 feet center to center of columns at the base. The approximate weight of each tower is 550 tons, the amount of steel in all the towers totaling 4,400 tons.

These towers are higher than any structures in the United States, the Woolworth Building being 792 feet high, and they are surpassed in height only by the Eiffel Tower, which is 984 feet high. The total cost of these towers was approximately \$2,870,000, including the structural steel, radio equipment, erection equipment, camp, transmission lines, handling and transporting of the materials in France, and the completion of the erection by contract. In addition to the structural steel, the material purchased included the equipment for the permanent substation, turbo-generator set, condenser pumps, switchboard, transformers, 1,000 horsepower boilers. The foundations for the towers, the radio power house, water supply, roads, and ground system were erected by the French and the materials supplied by them. The high-power radio station was authorized early in January, 1918, and the design was rushed to completion, the material to be fabricated in this country and shipped abroad for erection by the enlisted force. The award of the contract was made to the Pittsburgh-Des Moines Steel Co. in the same month, and on January 22 the contractor was notified that the number of towers was reduced from eight to seven, as the Bureau of Steam Engineering had decided that the best arrangement from an electrical standpoint would be that consisting of a central tower, surrounded by six at the angles of a hexagon. The location of the site which had been selected, was given by Admiral Sims in his dispatch of February 5, and on February 13 the sources of electrical power which were available were enumerated and it was shown that an independent power plant at this station would be unnecessary. At the same time, a dispatch from Lyons, to Steam Engineering, questioned the advisability of the hexagonal arrangement of the towers. Necessary equipment for the erection forces were prepared as fast as possible, based on obtaining deliveries of equipment at Philadelphia by April.

On March 14 the arrangement of the towers was changed, one additional tower being added, making eight, the scheme being to have four towers in each of two rows. Shipments of materials from this country began in April, 1918, and the construction of the foundations was started soon after. The erection of the steel was begun in September, 1918, with the enlisted force of the Navy and continued until shortly after the signing of the armistice, when all foundations had been completed and approximately 1,000 tons of steel had been erected. The forces which had been enlisted for this work were sent back to this country, and plans were then drawn for the completion of the towers by contract and in May, 1919, the erection was resumed by the Pittsburgh-Des Moines Steel Co., under contract No. 3788. The contract time for completion was January 24, 1920, and the work was completed within that date. After the completion of the installation of all the radio equipment, the station will be taken over by the French Government on the basis of actual cost to the United States.

Aviation activities in the United States.—At the outbreak of the war, the only naval air station in this country was at Pensacola, Fla., which was being used for training aviators, and had limited facilities for handling and housing planes. After the declaration of hostilities, authority for the construction of eight new coastal-patrol stations was granted and after careful study, sites selected. These additional stations, as originally planned, would provide for only 120 men each, and one small 66 feet by 100 feet steel hangar. It was estimated that these stations would cost approximately \$2,400,000 for the entire number to be built.

As an indication of the vast development which took place in naval aviation during the war, it may be noted that single stations have since cost more

than the amount that was estimated for the original eight, and instead of 120 men at a station, facilities have been provided for 1,200 men at individual stations, and instead of one small hangar, there have been placed as many as 15 units of a considerably larger type. The size has also increased from 66 feet wide and 18 feet clear height at Pensacola, Fla., to 200 feet in width with a 50 feet clear height at the naval aircraft factory, Philadelphia. Housing facilities have been provided for a total of 15,000 men, as many as 5,000 men being quartered at Pensacola at one time during the war. Naval air stations were established during the war at the following places:

Chatham, Mass., heavier-than-air and lighter-than-air.
 Montauk, Long Island, heavier-than-air and lighter-than-air.
 Bay Shore, Long Island, heavier-than-air and lighter-than-air.
 Rockaway, Long Island, heavier-than-air and lighter-than-air.
 Cape May, N. J., heavier-than-air and lighter-than-air.
 Anacostia, D. C., heavier-than-air and lighter-than-air.
 Hampton Roads, Va., heavier-than-air and lighter-than-air.
 Morehead City, N. C., heavier-than-air.
 Brunswick, Ga., heavier-than-air.
 Miami, Fla., heavier-than-air.
 Marine Flying Field, Miami, Fla., heavier-than-air.
 Key West, Fla., heavier-than-air and lighter-than-air.
 Coco Solo, Canal Zone, heavier-than-air and lighter-than-air.
 Pensacola, Fla., heavier-than-air and lighter-than-air.
 San Diego, Calif., heavier-than-air and lighter-than-air.
 Akron, Ohio, lighter-than-air.

Schools were established at the following points: Hampton Roads, Va.; Pensacola, Fla.; Santa Rosa, Fla.; Charleston, S. C.; Great Lakes, Ill.; Dunwoody Institute, Minneapolis, Minn.; Seattle, Wash.; San Diego, Calif.; Cambridge, Mass.

Rest stations were established as follows: Waretown, N. J.; Assateague, Va.; Beaufort, N. C.; Charleston, S. C.; Roanoke Island, N. C.; St. Augustine, Fla.; Tampa, Fla.; Indian Pass, Fla.; Islamorada Island, Fla.

Kite-balloon hangars were also erected at Marginal Parkway, N. Y., and Charleston, S. C., and the development of air stations was started for the following locations: Yorktown, Va.; marine flying field, Quantico, Va.; marine flying field, Parris Island, S. C.; Galveston, Tex.

There was also built in record time a naval aircraft factory providing facilities for the construction of all types of planes from the small scouts to the large proposed five-engine triplane. All of the latest developments in the design and construction of factory buildings for aircraft were included. The buildings included in this group were a factory building 400 feet square, a six-story reinforced concrete storehouse, an administration and office building, an assembly shop 1,080 feet long with an average width of 250 feet, a power house and dry kiln and heated lumber storage, a garage and accessory buildings. The total cost of the aircraft factory was approximately \$7,000,000.

Construction was also started on two Canadian air stations at North Sydney and Halifax, the plans for which were furnished by the bureau.

The total aviation expenditures in this country under the Bureau of Yards and Docks during the war was approximately \$30,000,000.

After the armistice the following air stations were abandoned: Montauk, Long Island; Bay shore, Long Island; marine flying field, Miami; Brunswick, Ga.; Miami, Fla.; Galveston, Tex.

United States helium-production plant, Fort Worth, Tex.—A plant at Fort Worth, Tex., for the separation of helium from the natural gas, for use as a buoyant agent in lighter-than-air craft, was designed by this bureau in conjunction with the Bureau of Steam Engineering, and is now being constructed by this bureau. The total cost of the plant, including the purchase and installation of equipment, will approximate \$1,500,000. The equipment is designed to effect the separation of about 40,000 cubic feet of helium per day.

The construction of the plant at Fort Worth for economic reasons, entailed the construction of a pipe line 104 miles in length to convey the natural gas to the plant from the wells at Petrolia, Tex., at a cost of approximately \$1,500,000.

Aviation activities abroad.—The following table shows the location, type, and appraised value of all the air stations operated by the United States naval forces:

Station.	Type.	Total appraised value.	Appraised value of structures and facilities constructed by United States Navy.
ENGLAND.			
Eastleigh.....	Heavier-than-air.....	\$1,317,763	\$247,896

		10,889,658	5,862,753

Aviation in France.—The aviation stations in France total 22, there being 3 dirigible stations and 3 kite-balloon stations. The dirigible stations at Guipavis, Gujan, and Paimbouf on the west coast of France each had a large wood hangar 109 feet wide by 621 feet long and 80 feet high. This hangar was designed in the bureau and the materials purchased and shipped abroad, the erection being entirely accomplished by the enlisted force under the supervision of members of the civil engineer corps. The hangars were erected in record time, the trusses being built on the ground and swung into place by means of large travelers built on the site. All of the stations included, in addition to the hangars, barracks, storehouses, mess halls, hospitals, garages, repair shops, recreation buildings, power houses, gasoline tanks, and water, telephone, and sewerage systems. The heavier-than-air stations have one or more runways. At the time of the armistice, all of the air stations in France were appraised at a total value of approximately \$5,700,000, which gives some idea of the extent of the construction at these stations. The largest station constructed entirely by the Navy was the assembly and repair station at Paulliac, blue prints showing the location and type of structures being attached.

Aviation in British Isles.—The two extensive seaplane stations at Eastleigh and Killingholme were taken over from the British and additional facilities

provided. The five stations in Ireland at Queenstown, Berehaven, Lough Fogle, Wexford, and Whiddy Island were also taken over from the British and more than doubled in size.

Aviation in Italy.—The aviation training school at Lake Bolsena, Italy, was placed in commission by the United States on February 21, 1918, and the station at Porto Corsini was taken over from Italy on July 24, 1918, for bombing operations against the harbor of Polo. Another air station at Pescara was under construction at the signing of the armistice, but was never commissioned.

Naval and Marine Corps camps.—Prior to the declaration of war against Germany, in the spring of 1917, there were but four naval training stations—one on the Pacific coast at Goat Island, San Francisco, Calif., capacity of 600 men; one at Great Lakes, Ill., capacity of 3,000 men; one at Newport, R. I., capacity of 2,000 men; and one at St. Helena, Va., capacity of 500 men.

Thousands of men in the summer were housed in tents and before cold weather was upon us in the fall of 1917 provision had been made at 30 places for housing nearly 100,000 men, as follows:

	Men in barracks.		Men in barracks.
Bumkin Island, Mass.....	1,000	Key West, Fla.....	1,000
Hingham, Mass.....	500	New Orleans:	
Portsmouth, N. H.....	150	West End.....	250
Newport, R. I.....	8,000	General.....	300
Newport, R. I. (Cloyne Field).....	1,500	Pensacola, Fla.....	1,000
Boston Commonwealth Pier.....	2,000	Great Lakes, Ill.....	20,000
Harvard (radio).....	2,500	Mare Island, Calif.....	4,500
New London.....	2,000	San Francisco, Calif.....	2,000
City Park (Brooklyn).....	2,800	Hampton Roads, Va.....	11,000
Pelham Park.....	5,000	Puget Sound, Wash.....	5,500
Dunwoody Institute.....	100	San Pedro, Calif.....	1,000
Minneapolis, Minn.....	700	San Diego, Calif.....	4,000
Philadelphia, Pa.....	4,400	Gulfport, Miss.....	2,500
Wissahickon (Cape May, N. J.).....	2,000	University of Washington.....	1,000
Annapolis, Md. (officers).....	500		
St. Helena.....	5,000	Total.....	97,200
Charleston, S. C.....	5,000		

Approximately \$19,000,000 had been expended on the establishment of naval training camps to December 1, 1917.

At the signing of the armistice there had been established or constructed at about 42 places, including naval training camps under construction, habitation for about 191,000 men in winter and 205,000 men in summer. Plans were then under way for increasing the capacity at Cape May, Charleston, Hingham, Seattle, and Mare Island.

The following is a complete list of naval training camps and capacities:

	Summer.	Winter.		Summer.	Winter.
Receiving ship, Boston, Mass., South Framingham.....	2,500	2,500	Training station, operating base.....	28,000	28,000
Training camp, Hingham.....	1,600	1,600	Training camp, navy yard, Charleston, S. C.....	3,100	3,100
Training camp, Bumkin Island.....	2,050	1,750	Machinist School Barracks, Charleston, S. C.....	600	600
Training camp, Deer Island.....	500	500	Naval air station, Pensacola, Fla. (some of these barracks were built under naval training camps).....	1,000
Naval radio school, Harvard University.....	4,400	4,400	Training camp, navy yard, New Orleans.....	1,000	500
Fuel oil school, Quincy, Mass.....	75	75	Training camp, West End Park, New Orleans.....	300	300
Naval training station, Newport, R. I.....	25,000	25,000	Training camp, Gulfport, Miss.....	2,000	2,000
Cloyne Field Barracks, Newport, R. I.....	1,600	1,600	Training station, Great Lakes, Ill.....	50,000	50,000
Seamen gunners' school, torpedo station, Newport.....	600	600	Naval auxiliary reserve school, Chicago.....	1,000	300
Submarine base, New London, Conn.....	3,000	2,100	Grant Park Camp, Chicago, including U. S. S. Commodore.....	1,000	500
Miscellaneous schools, district base, New London.....	350	350	Dunwoody Naval School, Minneapolis.....	1,000	1,000
Receiving ship, New York, including Ellis Island.....	2,000	2,000	Naval training camp, Detroit.....	1,200	1,000
City Park Barracks, Bay Ridge, Brooklyn, N. Y.....	2,500	2,500	Aviation schools, Buffalo.....	500	500
Pelham Training Camp.....	5,000	5,000	Aviation school, Detroit.....	100	100
Navy gas-engine school, Columbia University.....	15,000	15,000	Receiving ship, navy yard, Mare Island.....	6,000	4,000
Steam engineering school, Hoboken, N. J.....	2,000	2,000	Naval training station, San Francisco.....	4,500	1,900
Receiving ship, Philadelphia, Pa.....	6,400	6,400	Naval training camp, San Diego, Calif.....	4,000	3,000
Cook's school, Naval Home, Philadelphia, Pa.....	100	100	Naval training camp, San Pedro, Calif.....	3,600	3,600
Wissahickon Barracks, Cape May.....	6,500	6,500	Receiving ship, navy yard, Puget Sound.....	5,000	4,100
Ensigns' school, United States Naval Academy.....	450	450	Naval training camp, Seattle, Wash.....	3,000	3,000
Seamen gunners' school, navy yard, Washington, D. C.....	500	500	Total.....	205,275	192,875
Training camp, St. Helena, Norfolk.....	6,000	4,200			

Great Lakes, Ill.—The United States naval training station at Great Lakes prior to this country's declaration of war had a capacity of 3,000 men, and its capacity had been increased by December 1, 1917, an additional 20,000 men.

To facilitate control the station had been subdivided into a number of small camps, each being a complete unit within itself, as follows:

	Capacity.
Camp Perry, main training.....	7,012
Camp Dewey, main training.....	5,284
Camp Farragut, incoming detention.....	1,753
Camp Decatur, incoming detention.....	1,753
Camp Ross, outgoing detention.....	1,753
Camp Paul Jones, maintenance forces and special schools.....	2,232

Camps Perry and Dewey men were housed in one-story barracks, each house with groups of 72 men, with separate toilet and washroom facilities. Each regiment of 1,700 men is provided with one mess hall, which is divided into small rooms, each having a capacity for one company consisting of 144 men. Each regiment has one executive building with offices and class rooms to accommodate six companies, one storehouse, two power houses, one dispensary, one contagious ward, one drill hall. There is one brig for each camp, also each camp has one guardhouse, one carpenter shop, one mechanics building, and one armory. The barracks are heated by steam heat, served with concrete roads, walks, electric lights, power, sewers, and water.

Camps Farragut and Decatur are designed for the purpose of housing men in groups of 24 men each, with self-contained accommodations, such as messing, sleeping, and latrine facilities. Each of these two camps is provided with a central laundry and disinfectant. There is a separate galley in each camp in which food is prepared and distributed to the barracks in vacuum containers. The men are housed in these quarters for three weeks for observation, prior to

their going into the main training units, and the units are reduced to a small number to facilitate quarantine in the event of the outbreak of contagion.

Camp Ross is designed as an outgoing detention camp. The men here are housed in barracks holding only one-half a company (72 men). There is a separate mess hall for each company and a separate latrine for each company. It was the intention to have all men leaving the station pass through Camp Ross, when they are given final examination to determine whether their general health will warrant their leaving the naval station prior to their being distributed to the fleet.

Camp Paul Jones is constructed for the purpose of housing the maintenance forces of the station, the firemen, ships carpenters, plumbers, electricians, and trouble men. It also houses the yeomen attached to the various offices and contained buildings for hospital school apprentices, landsmen training for yeomen, landsmen training for special branches of the service, ships company, seamen guard, etc.

Hampton Roads, Va.—The buildings at Hampton Road, Va., were constructed on land purchased from the Jamestown Exposition Co.

There were available certain exposition buildings which after they were altered were utilized for administration purposes, recreation purposes, offices and dwellings. These buildings were of a permanent character. Provision was made for 10,000 men in one-story barrack buildings, and 500 men in incoming and 500 men in outgoing detention, making a total of 11,000.

In addition to these, there were constructed storehouses, mess halls, latrines and various gully structures, such as commissary stores, provision stores, bakery, scullery, laundry, tailor, general-building stores, cloth and small stores, machine shops, blacksmith shop, paint shop, plumbing shop, electric shop, and carpenter shop; also Hospital Corps school, rigging school, yeomen's school, music school, and swimming school.

The entire camp provided with concrete roads, walks, sewers, water supply, electric lighting, power, and steam heat.

Newport, R. I.—The permanent naval training station which existed at Newport, R. I., had a capacity of 2,000 men, and by November 1, 1917, this capacity had been increased an additional 8,000 men.

The temporary camps were constructed in two locations: one on Coasters Harbor Island, the site of the permanent training station, which was used for apprentice seamen, yeomen, firemen, Hospital Corps men, etc.; and the other on Cloyne Field, rented land, adjacent to Coasters Harbor Island. This was used for the naval reserve forces.

On Coasters Harbor Island the barracks were of one-story frame construction, being designed to sleep 80 men in cots. Each group of 80 men were provided with a latrine, and a common cafeteria mess hall was provided for the entire camp.

On Cloyne Field the buildings were of a similar type, except that the entire camp was messed in seven distinct mess halls.

All of the buildings at Cloyne Field and Coasters Harbor Island were of a very temporary character, hastily put up by station labor forces and enlisted men, from Army cantonment plans.

The buildings on Coasters Harbor Island were heated from the existing hot water heating system, but the buildings at Cloyne Field were heated from a steam power house which was built for the purpose, the work having been completed sufficiently to provide heat by the end of October, 1917.

Hospital construction.—When the United States entered the World War permission was granted the Bureau of Medicine and Surgery to provide naval hospital facilities to be constructed under the direction of the Bureau of Yards and Docks. Preparations for hospitals at Philadelphia, Pa.; Charleston, S. C.; Key West and Pensacola, Fla.; and New Orleans, La.; were started at once. These hospitals were followed by other emergency construction so that at the signing of the armistice there were provided 23 hospitals in the United States. Hospitals were established at Portsmouth, N. H.; Chelsea, Mass.; Newport, R. I.; New London, Conn.; Brooklyn, N. Y.; Wards Island, N. Y.; Pelham, N. Y.; Grays Ferry Road, Philadelphia, Pa.; League Island, Philadelphia, Pa.; Cape May, N. J.; Washington, D. C.; Annapolis, Md.; Norfolk, Va.; Hampton Roads, Va.; Charleston, S. C.; Paris Island, S. C.; Pensacola, Fla.; Key West, Fla.; New Orleans, La.; Gulfport, Miss.; Great Lakes, Ill.; Mare Island, Calif.; Puget Sound, Wash.

Appropriations totaling \$21,045,000 were made by Congress, of which the sum of \$1,008,742 was returned to the Treasury after the signing of the

armistice, making a net total of \$20,036,258 appropriated for hospital construction.

About 500 buildings exclusive of dispensaries were constructed in the United States providing for a hospital personnel of approximately 17,000 beds. The work included not only the buildings but also heat, lighting, and plumbing facilities.

None of the emergency hospital construction has been abandoned or allowed to go to waste. Most of the buildings were erected on naval hospital and Government-owned reservations. Those few buildings on leased property have been salvaged or turned over to the Government institutions for public use. The emergency hospitals at New London, Conn., and at Wards Islands, N. Y., are now in use, respectively, by the city of New London and the Manhattan State Hospital for the Insane. The hospital buildings at Grays Ferry Road, Philadelphia, Pa., at Cape May, N. J., and about half of the emergency hospital buildings at Chelsea, Mass., have been turned over to the Treasury Department for the use of the United States Public Health Service. The hospital buildings erected at Pelham Bay, N. Y., have been salvaged as far as possible. Its equipment and heating and plumbing systems have been used at other hospitals.

TRANSPORTATION EQUIPMENT.

During the period of the war, April, 1917, to November, 1918, the bureau provided transportation equipment as follows:

Size or capacity.	Num-ber.	Cost.	Size or capacity.	Num-ber.	Cost.

Secretary DANIELS. Mr. Chairman, the matter in regard to aviation I will bring to you on Thursday, and that will conclude my hearing.

The CHAIRMAN. Very well. The committee will stand adjourned until 10 o'clock on Thursday morning.

(Thereupon, at 12 o'clock m., the subcommittee adjourned until Thursday, May 20, 1920, at 10 o'clock a. m.)

NAVAL INVESTIGATION.

THURSDAY, MAY 20, 1920.

UNITED STATES SENATE,
SUBCOMMITTEE OF THE COMMITTEE ON NAVAL AFFAIRS,
Washington, D. C.

The subcommittee met, pursuant to adjournment, at 10 o'clock a. m., in Room 235, Senate Office Building, Senator Frederick Hale presiding.

Present: Senators Hale (chairman), Ball, and Keyes.

The CHAIRMAN. The committee will please come to order. Will you proceed, Mr. Secretary?

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

Secretary DANIELS. Mr. Chairman, when I concluded the hearing on Tuesday I was speaking of aviation. Naval aviation grew, in war period, to force of nearly 50,000. When hostilities ended we had in naval aviation, including marines, a force of 48,789 officers and men, nearly as many as were in the entire Navy when I became Secretary, in 1913. These comprised 2,835 officers and 32,873 men in the naval flying corps, with 10,579 men of other naval ratings assigned to aviation duty, and 282 officers and 2,180 men in the Marine Corps aviation section. A total of 18,736 officers and men were in service abroad, as follows:

	Navy.	Marines.
Officers.....	1,237	182
Enlisted men (aviation ratings).....	8,215	1,030
Enlisted men (aviation duty, miscellaneous ratings).....	8,072	
Total.....	17,524	1,212

There were in operation in Europe 51 aviation units, including schools, detachments, patrol stations, and supplies and repair bases. Twenty-seven stations were built in Great Britain, France, and Italy. The first organized unit of the American armed forces to land in France was the naval aviation detachment which reached Bordeaux June 5, 1917. Eighteen stations were built and operated in France, stationed at various points along the coast and mainly engaged in antisubmarine patrol. The Northern Bombing Group established in northern France, cooperated with the Dover Patrol in aircraft raids over the German submarine bases at Bruges, Ostend, and Zeebrugge. Our naval aircraft abroad made some 5,691 flights, a total of 791,398 nautical miles. Reports state that during the last 10 months of hostilities no convoy protected by our naval aircraft was successfully attacked. Thirty-nine attacks on enemy submarines were accredited to our aviation forces operating in European waters. Twenty-four naval aviation units were in operation in America, patrol operations being

carried on by two stations in Nova Scotia, 9 in the United States and 1 in Panama, the entire Atlantic coast and Canal Zone being patrolled. We maintained a number of training and experimental stations, supply and repair bases, and schools. Naval aircraft flew a total of 2,455,920 nautical miles on patrol duty in home waters, and 10,949,340 nautical miles in training.

United States naval aviation has to its credit notable achievements—the first flight across the Atlantic, made by the *NC-4*; the flight of the dirigible *C-5* from Montauk, Long Island, to St. Johns, Newfoundland, 1,050 nautical miles in 25 hours and 50 minutes; the records made in 1912, 1913, and 1914 by our flyers when naval aviation was in its infancy; the use of naval aeroplanes with the fleet in Mexican waters, scouting over the trenches at Vera Cruz; the first flight made by an aeroplane from a warship, and others which have marked the development of this branch of the service. In 1911 five officers were assigned to aviation duty, and their equipment consisted of two machines. In 1916 the personnel had grown to 318, equipped with 30 heavier-than-air machines. In 1918 naval aviation had a personnel of nearly 50,000 with a flying equipment of over 2,600 heavier-than-air machines and 580 lighter-than-air craft. From 1911 to 1914 the total appropriations made by Congress for naval aviation amounted to \$55,000. The act of March 3, 1915, appropriated \$1,000,000; that of August 29, 1916, \$3,500,000. The total appropriations during the war period amounted to about \$285,000,000, of which \$97,000,000 was withdrawn after the end of hostilities. The following table shows the appropriations made by years:

Table showing appropriations, personnel, and flying equipment.

Fiscal year.	Act of—	Appropriation, fiscal year.	Calendar year.	Personnel.	Machines H-A.	Machines L-A.

Here is a fuller statement in regard to the aviation service during the war, which I will not take the time to read. This is the matter I spoke of on Tuesday, and I offered for the record.

The CHAIRMAN. Will you put it in the record?

Secretary DANIELS. I will put it in the record; yes, sir.

(The matter submitted by Secretary Daniels is here printed in full in the record as follows:)

RECORD OF DEVELOPMENT OF AVIATION IN THE UNITED STATES NAVY.

NAVAL AVIATION.

General.—In considering the growth of aviation in our Navy it is of more than passing interest to note the wonderful development of the art of flying, which has been so prodigious in the very few years in which it has been possible to practice it. It seems incredible that the feat of Bleriot in crossing

over the channel in 1900 antedated flying over the Atlantic only by 10 years, and that we can only go back nine years for the first employment of aircraft in war. In the war between Italy and Turkey in 1911 Italy sent three or four French exhibition machines to the front with her army. These machines showed conclusively the value of aviation for military scouting purposes, but as the Turks had no aviation whatsoever the war did nothing to develop the airplane or the airship.

In the Balkan War which followed, aircraft were used. The aviation personnel, however, was made up of foreign and hired fliers, who were not perhaps interested in including combat as a part of their activities, so that no great experience was gained through this conflict. In 1914, therefore, not only the United States, but all nations were ignorant of the extent of the demands that were to be made on aviation, and of the development which aviation would undergo immediately that it entered the arena of war. At the outbreak of hostilities France had about 800 flying machines of a heterogeneous type. England had not begun to take up aviation seriously and had about 100 planes. Germany was far better off than any other European power. She had devoted great attention to the development of Zeppelins, and in addition to having certain of these units, upon taking up arms, the Tonton was equipped with about 500 airplanes of a standardized type, and had an organization which permitted production along acceptable and standard lines.

As the war progressed, military aviation over the land developed intensively. Its purposes and ends soon became well defined. In naval aviation, as in naval warfare generally, one phase was intensified, namely, that of suppressing the submarine. Aircraft, both heavier and lighter than air, demonstrated their great usefulness for patrolling naval areas and were employed extensively in the North Sea, the Channel, and over the Adriatic for this purpose. Toward the end of the war the British grasped the importance of making aviation a definite part of her naval establishment and created the means for permitting airplanes to accompany the Grand Fleet.

EARLY DEVELOPMENT.

Pioneer experimentation.—Although Langley in 1896, at Quantico, had given the first scientific demonstration of aeronautical principles, and the Wrights at Kitty Hawk in 1903 had made the first flight in a heavier-than-air machine carrying a pilot, it was not until the early part of 1911 that the first aircraft capable of operating from the water was developed. This craft was built by an American, and its first successful flight marked the beginning of heavier-than-air naval aviation. However, prior to this time, November 14, 1910, Mr. Eugene Ely carried out the first successful experiment at Hampton Roads in flying a Curtiss land-type biplane from the deck of the U. S. S. *Birmingham*. A temporary platform was placed forward on the deck of the ship with the view of assisting the aviator to get off by having the ship steam head to the wind. Mr. Ely, however, did not need this help and succeeded in making the flight while the vessel was at anchor, thereby increasing the value of the experiment.

In the following year, January 18, 1911, Mr. Ely made a successful landing with an airplane on the deck of the U. S. S. *Pennsylvania*. The next day he flew the same plane from the deck on which he had landed.

The following month, Mr. Glenn Curtiss flew from the water at his San Diego base and landed alongside the U. S. S. *Pennsylvania*, and was hoisted on board that ship. He was subsequently hoisted out again and flew back to his camp. This performance, together with the previous performance of Mr. Ely, gave a very decided impetus to naval aviation in England, France, Italy, Russia, Germany, and Japan.

In the summer of 1911 Mr. Curtiss made a flight in a flying boat at Hammondsport, N. Y. A practical flying boat was not constructed, however, until 1917, and the interval between 1911 and 1917 was given over almost entirely to the field of experimentation.

In 1911 our Navy organized its first naval aviation section. It consisted of a few naval officers who volunteered and were specially detailed for the purpose of observation, training, and experimentation in aviation. Lieut. T. G. Ellyson was the first naval aviator to qualify. Lieut. John Rodgers, United States Navy, the second. Their preliminary flight training was obtained at the flying schools conducted by Curtiss and the Wright Bros. A short time later, January 20, 1911, Lieut. J. H. Towers and Ensign V. D. Herbster, United States Navy,

were similarly assigned. In 1912, Naval Constructor H. C. Richardson, United States Navy; Lieut. B. L. Smith, United States Marine Corps; Lieut. (Junior Grade) G. DeC. Chevalier; Lieut. (Junior Grade) P. N. L. Bellinger; and Lieut. (Junior Grade) W. D. Billingsley began training. In 1913, Lieut. (Junior Grade) J. M. Murray, Lieut. Commander H. C. Mustin, Lieut. (Junior Grade) M. L. Stolz, Lieut. (Junior Grade) R. C. Saufley, Civil Engineer J. B. Rockwell, Lieut. K. Whiting, and Lieut. C. K. Bronson were added to the ranks of the naval aviators. These men were the pioneers in naval aviation.

EARLY ORGANIZATION.

Until 1915 the general construction of airplanes and hydroaeroplanes was carried on under the cognizance of the Bureau of Construction and Repair and the training of aviators and aviation mechanics under the Bureau of Navigation. No specific appropriation for aviation was requested, except under the Bureau of Navigation to cover aerial training and navigating instruments. All bureaus did their share in providing specific parts of new outfits under their appropriations for equipment, just as was done with boats.

March 13, 1911, Capt. W. I. Chambers received orders to the Bureau of Navigation directing him to devote his time exclusively to aviation. It is probable that up to the beginning of 1913 we had made as much progress in naval aviation as any other nation.

First aviation camps.—During the summer of 1911 a capacious wooden hangar was built at Greenbury Point on Government land near Annapolis, but this location proved unsuitable owing to the danger from stray bullets from the Naval Academy target range.

During the winter of 1911-12 an aviation camp was established at San Diego on land adjoining the Curtiss camp. Here considerable valuable experimental work was done in testing the comparative efficiencies of different types of hydroaeroplanes.

In the summer of 1912 the camp was moved to Annapolis, where tent hangars were set up fronting the Severn River. Three planes, with a makeshift machine shop, made up the material, and an instructor, several students, and mechanics comprised the personnel.

In the winter of 1912-13 the Annapolis Camp was transported by the Navy collier to Guantanamo. The Cuban camp was commanded by Lieut. Towers, subject to orders from the commander in chief of the fleet, to whom special instructions had been given. The marines had a separate camp at Culebra, but they later joined forces with the aviators at Guantanamo. Many interesting practical tests were made in cooperation with the ships and many of the fleet officers became familiar with seaplanes. At this time several notable flights were made along the coast, and the usefulness of aircraft as scouts in detecting the approach of a distant fleet and in detecting mine fields and submerged submarines was amply and practically demonstrated.

In the summer of 1913 the aviation camp was returned to Annapolis, where a regular system of weekly practice flights to and from certain points in Chesapeake Bay was inaugurated by Lieut. Towers. At this time 14 officers had qualified as naval aviators. Much of the summer of 1913 was devoted to the testing of a new flying boat at Hammondsport.

In October, 1913, a board of aeronautics was appointed by the Secretary of the Navy to report on the needs of a suitable organization and complete establishment. Capt. W. I. Chambers was made chairman of the board, which met on November 18, and a policy of development was outlined. One of the recommendations of the board was the establishment of an aviation station at Pensacola. This recommendation was approved, and in January, 1914, the first naval air station in the United States was established at Pensacola.

In the meantime the Annapolis camp was broken up and equipment and personnel transferred to the U. S. S. *Mississippi*, which was stationed off Pensacola. Lieut. Commander H. C. Mustin, the commanding officer of the *Mississippi*, became the first commanding officer of the Pensacola station. In the summer of 1914, the Government having sold the U. S. S. *Mississippi*, the U. S. S. *North Carolina* became the naval aviation ship.

Notable records.—Our first Curtiss hydroaeroplane was capable of developing 100 horsepower. Later the following seaplanes were used by the naval aviators: Two Renault 70 horsepower; two 4-cylinder Wright 40 horsepower; two 6-cylinder Wright 40 horsepower; and one Sturtevant 40 horsepower. These aircraft made up the entire equipment with which naval aviation was carried

on during its formative period. These planes could not remain in the air longer than two hours, the average endurance being about 1 hour and 45 minutes. They were two-seater open-faced pusher type seaplanes of very frail construction. The pilot and passenger were seated on a sort of open framework immediately forward of the motor. The tail of the plane was made of light bamboo poles and a crash, however slight, was always accompanied by serious casualties, due, not only to the light construction, but also to the fact that the motor radiators were placed immediately back of the pilot's head.

In 1913 Billingsley was killed in a crash, and in 1914 and 1915 Murray and Stolz made their sacrifice to the new science. In 1916 Rockwell and Saufley were killed within three weeks of one another, and in the same year Bronson was killed by the premature explosion of a bomb.

A review of the early experimentation with hydroaeroplanes would not be complete without mention of the use of catapults and the single cable for launching purposes. Lieut. Ellyson was successfully catapulted into the air from a float at Annapolis, and then Lieut. Commander Mustin from a ship under way, and later Lieut. Bellinger at Pensacola from a barge. Lieut. Ellyson about the same time made his celebrated flight from a single improvised wire cable running from the shore to the water.

The first notable flight by a naval aviator was made in 1912 by Lieut. John Rogers, who flew from Annapolis to Washington, and then to College Park, Md., from which place he later flew to Annapolis via Baltimore and Havre de Grace. After the arrival of the new Curtiss machines, Lieut. T. G. Ellyson and J. H. Towers made a memorable record flight over the waters of Chesapeake Bay, from Annapolis to Fortress Monroe, Va., and return.

Many records were made by our intrepid aviators in these early years. In 1912 Lieut. Towers made a record flight of 6 hours and 10 minutes in a Curtiss seaplane. In the same year Ellyson ascended to an altitude of 3,200 feet.

In June, 1913, Bellinger made a world's record for altitude by ascending to 6,200 feet in 45 minutes in a Curtiss seaplane. The following year Lieut. Bellinger made another record of 10,000 feet using a Burgess type seaplane. In the summer of 1913, Lieut. B. L. Smith, United States Marine Corps, made a successful flight in a combined water and air craft, by starting from the water and landing on the land and then returning to the water. In 1915 Lieut. Saufley ascended to an altitude of 14,500 feet in a Curtiss seaplane and later on made an endurance record in the same type of seaplane of 8 hours and 20 minutes. This flight terminated in his death.

Later organization.—In February, 1914, Capt. Chambers was relieved by Capt. Mark L. Bristol. The office was conducted by Capt. Bristol, with the assistance of officers detailed from time to time, until the 1st of March, 1916, when the captain was ordered to sea. The office was then conducted by Rear Admiral J. S. McKean, aid for material in the office of the Chief of Naval Operations. Lieut. C. K. Bronson was detailed as the admiral's assistant for aviation, and continued in this capacity until November, 1916, at which time his death occurred, from accident. Lieut. Towers then took his desk and continued in the office of the Chief of Naval Operations in this capacity throughout the war.

A month after war was declared Commander Noble E. Irwin was ordered to aviation duty under material in the office of Naval Operations, and in July of the same year aviation work was segregated and moved to the Navy Annex. This condition continued until March 7, 1918, when the General Order No. 375 was signed by the Secretary of the Navy, creating the office of the Director of Naval Aviation.

The Director of Aviation was made responsible to the Chief of Naval Operations.

In May of 1919 Capt. T. T. Craven, United States Navy, relieved Capt. Irwin as Director of Naval Aviation.

Early types.—The first operations at Pensacola were carried on in the E type of hydro-aeroplane, with the pusher propeller, and a few F-type flying boats, but in 1916 these were superseded by the N-type tractor hydroplanes, and from this date on the percentage of fatalities was greatly lessened. In the tractor type of seaplane the engine is forward of the pilot and in case of an accident it takes the force of the crash. Most of the seaplanes used up to 1917 were converted land planes, so that to a certain degree the early development of naval aviation was largely connected with the progress of military aeronautics, but from that time on the Army and Navy types became widely divergent.

Vera Cruz.—When the fleet was ordered to Mexican waters in April, 1914, in connection with the occupation of Vera Cruz, two aeroplane sections of two aeroplanes each, completely manned and with full outfits, were sent on board the *Mississippi* and *Birmingham* to Vera Cruz and Tampico. Those at Vera Cruz were used continually, and although the Navy's aeroplanes are not fitted for land work, for 43 days they did a good deal of scouting over the trenches protecting Vera Cruz. To every call made upon them our young aeronauts made ready and cheerful response. Their scout work in the sky was of value in the combined operations of the Army and Navy.

Chance in concept of seaplane usefulness.—The mention of the *Pennsylvania*, from and to which vessel flights were conducted on the west coast in 1911, the *Birmingham*, the *Mississippi*, and the *North Carolina* has a special significance. It is perhaps not generally understood that up to as late as 1917 all plans revolving about the central idea of sea flights as distinguished from flights over land inevitably included the use of warships. It was the accepted notion that the usefulness of aeroplane flights over the water, so far as they related to naval possibilities, was limited to the extent that they could cooperate with and maintain contact with the units of the fleet. During the active operations by seaplanes in the theater of war for the suppression of the submarine this original theory was largely modified, but to-day we see a reversion to this idea. Motor improvements, amplification of effective operating radius due to increased fuel supply, and the construction of hulls that were comparatively seaworthy had not a little to do with this variation of the initial concept of seaplane usefulness.

Conditions before the outbreak of the war.—As already mentioned, the European war was responsible for the intensive development of military aeronautics. Previous to the war progress was slow everywhere. During the conflict the active participants jealously guarded many of their secrets, and the United States upon entering the conflict found itself forced to engage at once in an activity that had assumed huge proportions. Foremost among the lessons taught to the United States was the necessity for a large trained personnel, and the Sixty-fourth Congress not only authorized a Naval Flying Corps but appropriated \$3,500,000 for aviation. The latter enabled the Navy Department to begin aviation activities on a much larger scale than had been possible previously.

The training of aviators was extended to officers and men of the Naval Militia and Coast Guard, and classes of men from these branches of the service were put through the school at Pensacola. Soon after our entrance into the war commissions from foreign Governments arrived which greatly assisted us with advice and information.

Heavier-than-air progress.—The first Navy airplane purchased in 1911 was a Curtiss triad, so called because it had controls both fore and aft. This airplane was equipped with a 75 horsepower motor and was capable of a speed of about 55 miles per hour. It had quite a number of flying hours to its credit when, following a crash, the front controls were broken off. As there were no spares on hand to make the necessary repairs, it was decided to fly this airplane with only the rear controls. The flight was successful, and it was interesting to note that shortly afterwards the use of the front controls was discontinued. This was shortly followed by a similar type of land machine which, due to slight refinements in design, developed with the same horsepower motor a speed of about 60 miles per hour. These two airplanes were followed by a Curtiss hydroplane of the pusher type equipped with a Curtiss OX motor of 80 horsepower. This plane was of the pontoon type, with controls both fore and aft and attained a speed of about 57 miles per hour. The only other airplane purchased during this first year was manufactured by the Wright Bros. and was of a pusher type. It was equipped with a 60-horsepower motor and attained a speed of about 55 miles per hour. The radical departure from general practice in this airplane was that one motor, by chain-drive system, operated two propellers which were arranged to revolve in opposite directions.

The year 1912 in particular brought out nothing but refinements of these types, although among the four planes purchased during this year was included a Wright hydro pusher. This, again, was of the pontoon type, equipped with a 60-horsepower motor, and developed a speed of about 50 miles per hour. It was built on the general type of the Curtiss hydropusher, although it kept the distinctive Wright features.

During the year 1913 five more airplanes were purchased, and it is noteworthy that this year brought out two radically different types. One of these

was the Burgess-Dunne seaplane and the other the Curtiss flying boat. The Burgess-Dunne seaplane was of the pontoon type, equipped with a Curtiss OX 80-horsepower motor, and developed a speed of about 60 miles per hour. The machine had no tail surfaces, the wings being arranged in a V form. This machine was inherently very stable, and because of this point was not sensitive in control. It would automatically follow each bump, and gave a rather unusual appearance by its action in the air. It was equipped with wing-tip floats, which helped to steady it while it was taxiing on the water. The Curtiss flying boat was of a radically different construction from other naval aircraft, inasmuch as the pontoon idea was not used. In this case the wings were attached to a hull and by means of the hydroplane construction the boat was enabled to go on the step and then take off similar to other hydroairplanes. It was, again, of the usual pusher type, equipped with the 80-horsepower motor and developed a speed of about 62 miles per hour. This year also brought out the Burgess flying boat, which was in a number of ways similar to the Curtiss flying boat, but with seats placed in tandem. It was equipped with a 80-horsepower Renault motor and developed a speed of about 60 miles per hour. Besides the aircraft enumerated above, there were also purchased during the year two Curtiss seaplanes and one Curtiss airplane equipped with OX 80-horsepower motor, which was a combined land and water type of craft, developing about 62 miles per hour, and termed the O. W. L. boat.

During the year 1914 there was purchased three more Curtiss flying boats and one Burgess flying boat, practically the same as those purchased during 1913 with a few added refinements.

During the year 1915 another Burgess-Dunne was bought and five Curtiss hydro airplanes. These were equipped with OXX 85-horsepower motors and were capable of a speed of about 62 miles per hour.

The year 1916 brought out a number of machines from various manufacturers, the principal feature being that some of the seaplanes were now of a tractor type. Among others might be mentioned the Thomas hydrotractors, the Martin hydrotractors, the Burgess hydrotractors, and the Sturtevant hydrotractors. Also it is important to note that the Curtiss Co. not only produced the KN twin tractor with OXX 85 horsepower motors, but also the familiar N-9 training seaplane equipped with OXX 85-horsepower motor. During this year the purchase of aircraft considerably increased, no less than 60 machines being obtained. It is worthy to note that during this year the horsepower was increased on practically all of the aircraft purchased. The usual experimental development during the past few years is clearly shown in the aircraft purchased during 1916, as during that year they began to assume their present-day form.

During 1917, to April 6, a seaplane was purchased from Paul Schmidt, Paris, and the Curtiss R-type seaplane was brought out. This latter seaplane was equipped with a Curtiss V-2 motor, developing about 200 horsepower, and was of the twin pontoon type construction. It was also during this year that the first H-12 flying boat was brought out. This was equipped with two V-2 Curtiss motors, which developed about 200 horsepower. The aircraft brought out during these last two years showed an advance of considerably more horsepower, as the speed was increased to 70 miles per hour and upwards.

This brings us up to the time of the beginning of hostilities and shows that on April 6, 1917, the Navy Department had purchased approximately 100 aircraft of different types.

The few aircraft in use by the Navy at the outbreak of the war did not more than meet the most rudimentary requirements of flight operations. It became necessary immediately to develop aircraft useful for other purposes than mere flying. Offensive work against submarines required machines of long air endurance and of large carrying capacity. In the early summer of 1918, the types of seaplanes considered necessary came into production in adequate quantities, and were made available at the different stations at home and abroad. A report of the organization developed and the methods put into effect for the production of naval aircraft would in itself require a volume, and it is not possible to go into great detail with regard to this matter at this time. In the United States it became necessary to establish a new industry over night, and with it to produce machines with which the builders were entirely unfamiliar. This work was conducted successfully in the face of stupendous difficulty.

The following memorandum from the Bureau of Construction and Repair outlines the steps taken for producing seaplanes during the war:

PRODUCTION OF SEAPLANES.

The bureau upon the entry of the United States into the war was not without experience in seaplane design and construction, and the theoretical and technical knowledge necessary to undertake the war program was to a large extent already available. Prior to 1916 no appropriations were made specifically for aircraft purposes, but funds were allotted by the department for aeronautical experiments as follows: 1912, \$25,000; 1913, \$10,000; 1914, \$10,000; 1915, \$10,000; and in 1916 the first appropriation was made for naval aeronautics in the sum of \$1,000,000. These funds had been spent in the construction of about 95 seaplanes for training purposes, and the establishment of the air station at Pensacola for the training of aviators and the testing of experimental seaplanes.

The first production order for seaplanes in the United States was placed in the fall of 1916 with the Curtiss Co. for 30 type N-9 training machines. Previously no satisfactory type had been developed and the preparations for war practically date from this order. By the spring of 1917, large classes of aviators were in training on these machines.

With the declaration of war, the first requirement was for more training machines and the Curtiss Co. was given an order for 64 more N-9 and 76 of a larger type designated as R-6. These orders filled the available capacity of the Curtiss Co. which at that time had large orders for training airplanes from the Army and the British Government. To permit expansion of the training program, additional orders were placed with each of the six other aircraft manufacturers for sample training planes of their design. Several satisfactory types were submitted for test and orders were placed in the summer of 1917, as follows: Burgess Co., of Marblehead, 12 planes of Burgess design, plus 30 Curtiss N-9's; Boeing Co., of Seattle, 50 planes of Boeing design; Aeromarine Co., of Keyport, N. J., 200 planes of Willard design; Curtiss Co., of Buffalo, 15 training boats type F and 122 R-6's, both of Curtiss design. These orders were delivered at a satisfactory rate and the training of aviators was at no time held back for lack of proceed with confidence to produce these training seaplanes is due to the experience gained in 1916. A satisfactory type, N-9, had been developed by the Curtiss Co. in cooperation with the bureau, and it was not difficult to arrange for other firms to produce similar planes equal or superior to it.

The development of the N-9 was a fundamental without which the entire naval air effort would have broken down. Its conception was simple in the extreme. In the summer of 1916 there had been a succession of fatal accidents with the pusher seaplanes then in use, and flying at Pensacola had come to a standstill. The chief constructor sent for Mr. G. H. Curtiss and proposed to him that he take the existing Curtiss JN Army plane, place a pontoon under it, add a specified amount to the wing area to carry the extra weight, and add specified amounts to the tail areas to give stability. The result was the N-9, which proved the remedy for the accidents at the flying school.

With the training program well under way, it remained to determine what part naval aircraft would play in the war and to provide the necessary material. At first it was not known whether the Navy would send aircraft abroad at all, but it was decided by September, 1917, that the Navy should operate 15 seaplane stations on the coasts of France and Ireland from which seaplanes would patrol the submarine-infested coastal waters through which American troops and supply ships were to pass.

Attempts were made to obtain information from abroad of any successful types in order that their manufacture might be undertaken, and, in July, 1917, a board of officers was sent to England, France, and Italy to obtain this information at first hand. This board on its return September 1, 1917, reported that there was no wholly satisfactory foreign seaplane suitable for coastal patrol; that foreign development had concentrated on the production of land machines, and that American types equipped with the new Liberty engine would be superior to any abroad. The joint Army and Navy technical board, acting upon this information, and with the knowledge that 15 coastal air stations abroad would be operated by the United States Navy, prepared a building program, which was approved by the Secretary in October, 1917.

This initial program provided for the first equipment of stations abroad, advanced training in this country, and replacements for the period of a year, and included 1,185 single Liberty engine flying boats, *HS-1*; and 235 twin Liberty engine flying boats, *H-16*; two types only, and both American designs (Curtiss). Among reasons for this policy were: (a) The engine had been demonstrated to be satisfactory; (b) these flying boats had been demonstrated

to be superior to any others; (c) provision of but two types with a single type of engine simplified production and maintenance; (d) two types of flying boats were necessary as the large boats could not be constructed in sufficient quantities, involved shipping difficulties, and drew too much water for use on certain of the French stations.

Again, as in the case of the training planes, the bureau was well prepared in the technical sense and could proceed with confidence to quantity production without much time lost in experiment. The problem was, of course, simplified by the requirement of but two types.

The *HS-1* was developed from a Curtiss design known as *H-14*, which was brought out in the summer of 1917 with twin 100-horsepower engines. It was too heavy for the power and was a failure. The Curtiss Co. then replaced the twin 100-horsepower engines by a single 200-horsepower engine. The boat then performed much better, and, while still underpowered, gave considerable promise. The bureau was in close touch with this development, and when the Liberty engine seemed to be successfully tested on the bench, arranged to have one of the experimental engines assigned to try in an *HS* boat. A contract was made with Mr. Curtiss to install this engine, and on October 21, 1917, successful trials were held over Lake Erie at Buffalo. There had been a friendly race with the Army to see which service would first make use of this remarkable new engine.

The boat was pronounced successful by a naval trial board and arrangements made for its production by the Curtiss Co. to the limit of its capacity. In order to provide additional units, the department purchased for \$50,000 the unlimited production rights from the Curtiss Co. and placed orders with five other concerns to build *HS* boats to Curtiss plans.

The first model, known by the type symbol *HS-1*, was a typical Curtiss type of flying boat having a length of 38 feet and a wing span of 62 feet. The gross weight in the air of 5,900 pounds included a crew of two men, one machine gun, and two 180-pound bombs. The maximum speed of 87 miles could be maintained for four hours. After production had got well under way, information was obtained that the 180-pound bomb was not really effective against submarines, and heavier bombs as well as a radio outfit would be needed. Obviously the extra weight would be carried only if the fuel supply were cut down, which was not advisable. The solution was found in an increase in the wing area of the boat by which a greater load could be carried in the air. The bureau designed a 6-foot wing and a larger rudder which could be supplied to the *HS-1* boats converting them to model *HS-2* without further change. This increased the span to 74 feet and permitted a total weight of 6,500 pounds. The radio, two 230-pound bombs, machine gun, and two pilots were carried with ease and, furthermore, the endurance was increased to 4.4 hours at full speed and 6.5 hours at cruising speed. The full speed was only reduced 2 miles per hour by this change in design, which at once gave us a vastly improved machine without interference with production. It is believed this is a unique example of a fundamental design change which did not cause nearly as much trouble as benefit.

The production of *HS-2* boats is summarized in the following table:

Companies.	Number ordered.	Shipped abroad.	Delivered.	Canceled after armistice.
Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y.	674	213	674
L. W. F. Engineering Co., College Point, N. Y.	300	10	250	50
Standard Aircraft Co., Elizabeth, N. J.	150	6	80	70
Gallaudet Aircraft Corporation, East Greenwich, R. I.	60	60
Boeing Airplane Co., Seattle, Wash.	50	25	25
Loughhead Co., Los Angeles, Calif.	2	2
Total	1,236	229	1,091	145

With these concerns the following yacht-building firms worked as subcontractors for the boat hulls: College Point Boat Co., College Point, N. Y.; George Lawley & Sons, Neponset, Mass.; Unit Construction Co., Philadelphia, Pa.; Mathis Yacht Building Co., Camden, N. J.; L. E. Fry & Co., Clayton, N. Y.; Palmer-Simpson Co., Saranac Lake, N. Y.; Mathews Boat Co., Milwaukee, Wis.; Fay & Bowen Engine Co., Geneva, N. Y.; Niagara Boat Co., Tonawanda, N. Y.

The other type adopted for production by the Joint Army and Navy Technical Board was the H-16, to be fitted with the twin Liberty engines of 400 horsepower each. This type had been developed during 1915 and 1916 by the Curtiss Co. and the British Admiralty. The original model had been the Curtiss *America* of 1914, built for a proposed trans-Atlantic attempt. The *America* was not successful because no high-power engines were available, but the British Admiralty ordered a number of them and fitted them in England with two French Adzani engines of about 100 horsepower each, known as "Small America's," and they were used to patrol submarine areas. Curtiss then designed the H-12, a larger machine on the same lines, which was fitted in England by the Admiralty with twin Rolls-Royce engines. The Admiralty redesigned the hull of the H-12 to provide greater strength and introduced for the first time the steep V bottom with double steps. The Curtiss Co. was given, in 1917, a larger order for the British redesigned boat, known in England as F-3 or "Large America" and in the United States as H-16. This machine was already in production at the Buffalo works of the Curtiss Co., but the design was arranged to mount Rolls-Royce engines. It became necessary to redesign extensively to provide for Liberty engines. As engines were installed in England, none of the H-16's had ever been completed or flown in the United States.

The redesign of the H-16 to take Liberty engine necessarily involved extensive changes, but there was no time to work out a trial installation. Production was started at once, and by a combination of good luck and good management, no serious difficulties developed. It should be remembered that the engine is the heart of a flying machine, and a complete change of power plant involves in addition to extensive structured revisions alterations in balance and stability.

The H-16 is a biplane flying boat 46 feet long with wings of 95 feet span. The twin Liberty engines develop 360 horsepower each, if low compression, or 400 horsepower if high compression. The weight empty is 7,400 pounds and loaded 10,900 pounds. The useful load includes four men, radio, two 230-pound depth bombs, and four machine guns. The maximum speed is 95 miles. At this speed the endurance is four hours, but patrols at cruising speed of nine hours were made in the war zone.

During 1917 the British Admiralty redesigned the H-16 again to produce a boat able to carry more depth bombs and to have greater endurance. A sample machine was successfully developed in the spring of 1918 and plans sent to the United States. In this case, the change to get greater load capacity was not at all like the HS-1 and HS-2 change noted above, but an entirely new design down to the last bolt. The new type F-5 had an allowable full load of 13,000 pounds, and could carry four depth bombs against two for the H-16, besides having a cruising endurance of 11 hours against 9 for the H-16. The maximum speed was about 7 miles less.

The advantages of the new type were obvious, and during 1918 as the H-16 contracts were completed, orders for type F-5 were placed with the same concerns. It should be noted that the British plans for the F-5 were taken from a sample machine and were in no way production plans. Also the details of construction were impossible for quantity manufacture, and the design provided for Rolls-Royce engines. The machine was completely redesigned at the Naval Aircraft Factory to adapt it for quantity production on the assembly system, to use American standard parts and practices, and to install twin Liberty engines.

The production of H-12's, H-16's and F-5's is summarized in the following table:

Companies.	Number ordered.	De-livered.	Shipped abroad.	Canceled after armistice.
Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y.	19 H-12	19		
Do.	74 H-16	74	62	
Do.	410 F- 5	60		350
Curtiss Engine Corporation, Garden City, N. Y.	50 H-16	50	18	
Naval Aircraft Factory, Philadelphia.	150 H-16	150		
Do.	680 F- 5	137		543
Canadian Aeroplanes (Ltd.), Toronto, Canada.	50 F- 5	30	1	20
Total.	1,433	520	159	913

In December, 1917, the naval aviation forces operating abroad in conjunction with the British Admiralty had found the twin-engine flying boat (the *Large America*, of the Royal Naval Air Service) a very superior fighting craft, and, following recommendations by Admiral Sims, a greatly increased program, calling for a total of 864 of the twin-engine flying boats, was authorized on December 26, 1917, for delivery by the spring of 1919. That added 629 boats to the program of 239 of October, 1917. The firms then manufacturing naval aircraft could not handle any larger orders. In those plants there were on order from the department 19 H-12's, which were suitable for training but not for patrol, and 134 H-16's for delivery in the first six months of 1918. The Curtiss plant at Buffalo could deliver 150 and the Naval Aircraft Factory 100 units. That left 480 boats to be secured from some new source, to be organized from the ground up. How was the situation to be met? Allowing three months for building a new plant and one month for equipping and organizing, work might start in four months, and deliveries begin before six months had elapsed. After the labor and material were assembled the capacity of the plant must be about 90 boats per month. Such a project would have required a very large plant, doing a gross business of approximately \$36,000,000 per annum, exclusive of engines, and its creation appeared impossible in the time available. Accordingly, after careful study a plan was worked out for coordinating existing yacht yards as well as metal and wood-working shops in manufacturing hulls, panels, and parts for delivery to a central organization in the nature of a great storehouse or progressive assembly plant. It was not practicable because of the financial aspect to get a private manufacturer to provide this large assembly plant, and since the plant must be built by the Government, it was obvious that it should be built as an addition to the existing Naval Aircraft factory. The extension was approved by the Secretary on February 9, 1918, and construction began at once.

Production in appreciable quantities was first reached in April, 1918; HS-1's were being delivered at the rate of 6 per week and H-16's at the rate of 3 per week, and these rates were constantly increasing, when in June the program was again augmented for delivery by the summer of 1919 by 700 F-5's, 300 HS-2's, 300 F boats, and 200 N-9's. In September this was increased 100 F boats.

By the summer of 1918 aircraft production was well under way and had reached its height about September 1, when deliveries were being made on twin Liberty engine flying boats at the rate of 13 per week from the Naval Aircraft Factory, Philadelphia, Pa.; the Curtiss Aeroplane & Motor Corporation, Buffalo, N. Y.; and Curtiss Engineering Corporation, Garden City, N. Y., and the Canadian Aeroplanes (Ltd.), Toronto, Canada. Single Liberty engine flying boats were being delivered at the rate of 38 per week, from the Curtiss Aeroplane & Motor Corporation, Buffalo; the L. W. F. Engineering Co. (Inc.), College Point, N. Y.; the Standard Aircraft Corporation, Elizabeth, N. J., and the Gallaudet Aircraft Corporation, East Greenwich, R. I. School or training machines were being delivered at the rate of 32 per week, from the Burges Co., Marblehead, Mass.; the Aeromarine Plane & Motor Corporation, Keyport, N. J.; and the Curtiss Engineering Corporation, Garden City, N. Y.

Hulls for the Naval Aircraft Factory's production, and also for a number of the above-mentioned private concerns, were being constructed by the Herreshoff Manufacturing Co., Bristol, R. I.; Robert Jacobs, City Island, N. Y.; George Lawley & Sons Corporation, Neponset, Mass.; L. E. Frye Co., Clayton, N. Y.; Mathews Boat Co., Port Clinton, N. Y.; Unit Construction Co., Philadelphia, Pa.; Mathias Yacht Building Co., Camden, N. J.; Charles L. Seabury Co.; and the Gas Engine & Power Co., Morris Heights, N. Y.; Niagara Boat Co., Tonawanda, N. Y.; Albany Boat Co., Albany, N. Y.; H. B. Nevins, City Island, N. Y.; Murray & Tregurtha Co., Boston, Mass.; Palmer Simpson Co., Sarnac Lake, N. Y.; College Point Co., New York; and a large number of wings, tail surfaces, and lateral fittings were being manufactured by the Curtiss Aeroplane & Motors (Ltd.), Toronto; the Victor Talking Machine Co., Camden, N. J.; and Lock & Co., New York City.

In the fall of 1918, however, it was found that aircraft were being installed at a rate in excess of that required both for training and for service abroad, and the program was reduced early in November by 550 F-5s, 248 HS-2s, and 300 school or training machines. As soon as the armistice was signed, the rate of production was slowed down as rapidly as possible, and cancellation on

outstanding orders was effected, which further reduced the program by 145 HS-2s, 512 F-5s, and 100 school machines. In completing the few remaining units, the manufacturers were able to liquidate their large labor force, and the industry was gradually reduced to a peace basis.

The construction of machines under this program was allotted to manufacturers already experienced in the art of airplane construction, as it did not appear wise to place orders with inexperienced concerns or to promise them orders which might drain raw materials already scarce and skilled labor from the established builders who were being pressed to expedite delivery. Many offers of facilities from manufacturers who had not previously built aircraft and also from inexperienced aircraft concerns were received by the bureau, and in every case hearing was given and careful investigation made. It was necessary in all production matters to cooperate closely with the Army by direct conference, and all especially important matters were submitted to the Aircraft Board for approval and coordination. This arrangement worked well and eliminated competition and duplicate efforts.

Before placing the larger contracts, prices and terms were submitted to the Aircraft Board for approval, although final approval was, of course, in the hands of the Secretary of the Navy.

At first school planes were purchased on a flat-price basis, but when the large production contracts for the large service planes were wanted, it was impossible to fix a fair price, due to a complete lack of experience in building these types in the quantity contemplated. Furthermore, the material markets were becoming demoralized, and there was no means of predicting future developments. The straight "cost-plus" contract was objectionable on many grounds, and a form of contract was evolved with the assistance of the Aircraft Board which provided for paying the contractor actual cost, plus a fixed profit of 15 per cent on an agreed estimate or "bogey" price, plus one-quarter of any difference or saving the contractor might make under such "bogey." This form of contract was in the main very satisfactory, and was used until late in 1918, when the mandatory "Navy order" was put in effect. The latter was less satisfactory, as it did not contain the incentive to bear "bogey" and involved an equally elaborate accounting system.

The Aircraft Board assigned the following aircraft manufacturers to accept orders from the Navy only: Aeromarine Plane & Motor Co., Keyport, N. J.; The Burgess Co., Marblehead, Mass.; Victor Talking Machine Co., Camden, N. J.; Boeing Airplane Co., Seattle, Wash.; Curtiss Engineering Corporation, Garden City, Long Island, N. Y.; Gallaudet Aircraft Corporation, East Greenwich, R. I.; Canadian Aeroplanes (Ltd.), Toronto, Canada; L. W. F. Engineering Corporation, College Point, Long Island, N. Y.; Curtiss Aeroplane Co., Toronto, Canada; and assigned a fraction of the capacity of Curtiss Aeroplane & Motor Co., Buffalo, N. Y.; Standard Aircraft Corporation, Elizabeth, N. J. The other plants in the country were assigned to the Army.

The producing capacity so assigned was adequate to meet the Navy's requirements and by September, 1918, production was in excess of requirements; all air stations at home and abroad had a full complement of seaplanes and shipments abroad were stopped temporarily. The armistice intervened before shipments had to be resumed.

In December, 1917, when manufacturers started building naval aircraft on a production basis, it was seen that it would be impossible to secure in the open market various materials, such as spruce, fabric, tape, dope, veneer, and steel tubing; and it became clear that the supply of them must be controlled by the Government. Of such materials, the most difficult to obtain appeared to be Sitka spruce on the Pacific coast, and the Navy was unable to secure sufficient to meet its needs. A considerable portion of the New England spruce output had been found suitable for airplane construction before the war; had, in fact, been purchased by Germany for that purpose; but at this time was apparently being overlooked. As the emergency for spruce became acute, it was deemed advisable to determine if suitable material could not be secured from the New England woods, and an officer from the Bureau of Construction and Repair was sent to investigate.

Early in January, 1918, he reported that approximately 1,000,000 feet per month of spruce suitable for aircraft construction could be secured from New England sources, at prices ranging from \$90 per 1,000 feet to \$125 for various lengths, and an agreement was reached with the Army whereby the Navy was to have the exclusive right to develop that territory.

The Navy Department then established an office in Boston, Mass., so as to keep in close touch with the New England spruce-producing mills, to secure information, to arrange contracts, and in other ways to safeguard an adequate supply of airplane spruce, the policy settled upon being a decision to use the New England lumber as a reserve stock in the event that the War Department should be unable to furnish Navy contractors with the required amount of Sitka spruce.

From February to May, 1918, about 1,000,000 feet of New England spruce was produced each month, but from June to October that quantity was reduced as the need was not so urgent. From January to May, 1918, deliveries of Pacific coast spruce were not coming through in a satisfactory manner, and an effort was made to use the New England wood. However, owing to the fact that much of it contained small pin knots and was in shorter lengths than the Pacific coast spruce, contractors were reluctant to use it, and in fact its use was difficult under the interpretation of the specifications existing at that time. Accordingly during May and June, 1918, detailed specifications were issued so as to allow the use of the type of spruce coming from New England and in August, 1918, manufacturers of school seaplanes were required to build wooden parts of laminated and spliced construction, and hence a larger quantity of New England spruce was used.

By May, 1918, about 70 New England mills were turning out spruce suitable for airplanes, and it became apparent that the production was greater than the needs of the Navy. Accordingly efforts were made to dispose of the excess. Various allied Governments were approached on the subject, and the Navy was successful in arranging a contract for 1,000,000 feet with the British war mission. When the first shipments reached England, the British war mission to this country was notified that the material was satisfactory and was authorized to procure a further amount. Accordingly, shipments were then made to the British at the rate of approximately 500,000 feet per month under that contract and under a subsequent one calling for 3,000,000 feet.

Early in June, 1918, the War Department began to run short of strut material, and the Navy was asked to furnish various quantities to manufacturers of airplanes for the Army. In compliance with that request, New England spruce was supplied to the Sturtevant Aircraft Corporation, the Metz Co., the Wilson Body Co., the Packard Motor Co., and the Engle Aircraft Co., all contractors to the Army, the larger part of this material being strut stock suitable for the manufacture of De Havilland and JN-4 struts. The Army contractors first accepted it hesitatingly, as many were dubious about the use of material containing pin knots, but as soon as it was found that it worked as well, if not better, than Sitka spruce, the Navy was in receipt of insistent orders from those same manufacturers for a further supply, and until the signing of the armistice, the Navy supplied them approximately 1,000,000 feet.

Soon after the shipment of spruce to the British began to go forward, it was determined that it would be necessary to dry spruce down to a point that would permit its being shipped abroad in confined quarters. In order that the necessary drying could be accomplished under the control of a Navy inspector, it was found advisable to secure a yard where that material and material for the Army and the Navy contractors, could be selected and sorted out. A yard at the foot of Southampton Street, Boston, Mass., was selected and secured at a nominal rental—\$4,000 per year—and stocks of New England spruce were built up, nearly 6,000,000 feet of lumber being handled there.

When orders were placed for Sitka spruce, prices ranged as high as \$350 per thousand board measure feet. In October, 1918, however, "A" grade spruce was charged at \$642 per thousand, and the Navy was informed that it was the intention of the War Department to amortize in a period of 10 months its entire Pacific Coast lumbering establishment, cut-up plant, railroads, etc., and that it was necessary to charge those prices to absorb that overhead.

While many of the mills on the Pacific coast were cutting spruce for the Army's cut-up plant, there were few small mills not considered by the War Department, which had a small output of Sitka spruce. This stock was sold to various New England mills holding Navy contracts, and Sitka spruce was shipped in from the West over the Canadian Pacific Railroad, sorted in New England, selected by Navy inspectors, and purchased at the same prices paid for New England spruce, viz, \$125, \$110, \$100 per thousand feet for "A."

"B," and "C" grades. This material was found to be just as satisfactory as that stock supplied by the Army at \$642, \$350, and \$160 per thousand for "A," "B," and "C" grades respectively.

The Army's airplane program required a tremendous quantity of airplane wing-covering fabric, and it was thought best to pool the interests of the Army and the Navy in securing it. Accordingly the control of the mills capable of producing this material was centralized in the Army, with the understanding that the Navy requirements would be taken care of. At no time during the active production period of the Navy seaplanes was there any great shortage in fabric or tape; but when a slight shortage did exist, every effort was made by the Army to keep Navy contractors supplied. The manner in which fabric was supplied was at all times very satisfactory, and shipments in many instances were made within 24 hours after receipt of the Navy's request.

As the Navy's program grew it was found that a larger quantity of acetate dope than was first anticipated would be required. At the same time there was a shortage of cellulose acetate, and it was therefore decided that the control of that necessary product should be centralized in the War Department, as has been done with tape and fabric. From January until July, 1918, however, there was no difficulty in securing sufficient acetate dope to meet the Navy's needs, due largely to the fact that the Army's airplane production had not yet reached any large volume. In July Army production increased greatly, and there was considerable difficulty for both Army and Navy in securing the required amount of acetate dope, but at no time was Navy production held up for the lack of acetate dope.

Nitrate dope was secured by the Navy from the Du Pont Co., but owing to the shortage of nitrates the War Industries Board was reluctant to release the necessary raw materials. However, by ordering merely enough to satisfy immediate needs, maintaining low stocks, and watching them carefully the bureau was able to secure sufficient nitrate dope.

From May to October, 1918, it was found that some materials were running short, especially tubing and waterproof plywood. While it was unnecessary in many instances to purchase those materials for Navy seaplane contractors, it was necessary for the Navy to help seaplane contractors to secure them, as production could be held up because of the lack of any one. Many delays in delivery of materials were brought about by improper handling of priorities, certificates by contractors, but Navy inspectors at contractors' works soon found the proper method of securing quick deliveries of materials through the departments' cooperation, and, except in rare instances, little difficulty was experienced in securing adequate stocks to maintain production at contractors' plants at all times.

During 1918 several new types of seaplanes were constructed for the Navy Department, and trials were conducted to determine their suitability for special service, either as training or as service machines. The order for each of these seaplanes was placed with the definite purpose of development of some particular need in the future program, if the war had continued.

With reference to training machines of the flying-boat type, the Curtiss Model F had proved itself the most satisfactory in use, but it was desired to develop a machine of better structural character along the same lines. Encouraged by the Navy Department the Aeromarine Plane & Motor Co. developed its Model 40-A and the Curtiss Engineering Corporation its MF (Modified F) boat, both of which were recommended for adoption by the trial board, and for which contracts were awarded.

Several service machines of particular interest, some of which presented a distinct advance in airplane design, were constructed and tried out in the summer and fall of 1918. Of these the most important are the NC-1, the Curtiss Model 18-T, or Kirkham Fighter, the HA, and Gallaudet or D-4.

The NC-1 is a large flying boat, built by the Curtiss Engineering Corporation, under the direction of certain officers of the Bureau of Construction and Repair who were responsible for the design. It is a biplane, and has a spread of 126 feet for the upper wing, and a length of 68½ feet from the bow to the end of the tail surfaces. The weight, fully loaded, is 22,000 pounds, the bare machine weighing 13,800 pounds. It is equipped with three Liberty engines, each located in a nacelle between the wings. Of particular note is the hull, which somewhat resembles a large pontoon in appearance, and which has proved especially efficient in planing at get-aways. The NC-1 is the machine which

made a flight at Rockaway, N. Y., on November 27, 1918, with 51 men aboard, thereby establishing the world's record for passengers carried.

After the armistice four NC boats were fitted with four Liberty engines for the trans-Atlantic flight.

The Curtiss model 18-T, or Kirkham Fighter, is a land machine, designed and constructed for the Navy Department by the Curtiss Engineering Corporation and intended for the protection of those bombing squadrons along the coast of France which required extremely fast machines. It is a triplane of 32-foot wing spread and has 2,800 pounds weight when loaded. It is equipped with a Curtiss (K-12) engine, a new type engine which was used for the first time in this machine. The Curtiss 18-T made 162 miles an hour, a world's record. It carried two men, two synchronized guns forward and two Lewis guns in the rear cockpit.

The HA is a single-pontoon seaplane, equipped with one Liberty engine, constructed by the Curtiss Engineering Corporation for the Navy. It has a wing spread of 36 feet. This is a two-seater machine equipped with two synchronized machine guns forward, and two Lewis guns in the rear cockpit. Its maximum speed of 125 miles per hour is a remarkable performance for a seaplane.

The Gallaudet D-4 is a two-seater seaplane with a single Liberty engine driving a propeller by means of a ring gear mounted on the fuselage aft of the wings. The machine is designed as a fighter and with two men, and 434 pounds of machine guns and bomb made 119 miles per hour. At this speed the endurance is 2.5 hours. The design is distinctly novel in that it gives excellent view and field of fire forward.

Aircraft, 1917-18.—The numbers of aircraft on hand and on order April 6, 1917, and on November 11, 1918, were as follows:

	On hand.		On order.	
	April, 1917.	November, 1918.	April, 1917.	November, 1918.
Flying boats.....	6	1,170	1,921
Seaplanes.....	45	695	88	102
Land planes.....	3	262	3	10
Lighter-than-air craft:				
Free balloons.....	10
Kite balloons.....	2	205	3
Dirigibles.....	1	15	13	30

Of the above 570 aircraft of various types were sent abroad.

Lighter-than-air.—The lighter-than-air activities of the Navy began in May, 1915 when the Navy Department contracted for one dirigible with the Connecticut Aircraft Co., a concern which had secured the services of a German engineer, a German mechanic, and an Austrian pilot. This airship, the *A-1*, was finally accepted in April, 1917, but was much overweight, and after a few short flights was deflated and eventually broken up.

On August 27, 1915, two officers were ordered to Akron, Ohio, for instruction in ballooning by pilots in the employ of the Goodyear Tire & Rubber Co.

In 1916 the German submarine activity brought attention of the department to the necessity of developing lighter-than-air types. Plans and designs were developed for the first of the nonrigid single-motored airships. During this year several Goodyear spherical and kite balloons were secured, and a few officers received a certain amount of instruction in balloons at the naval air station, Pensacola, Fla.

In 1917, 16 nonrigid airships of about 80,000 cubic feet capacity, with single 100-horsepower motor, were contracted for and built by the Goodyear Tire & Rubber Co., the Goodrich Tire & Rubber Co., and the Connecticut Aircraft Co. The idea of the small-type airship for antisubmarine work was British, and an American design was prepared by the Bureau of Construction and Repair. This ship consisted of an envelope from which a Curtiss airplane fuselage was suspended. These airships were improved in detail and in several instances are still in existence. The type proved to be very successful.

In the spring of 1917 two officers were sent to Akron on inspection duty, and in June several regular officers and a class of newly enrolled reserves began

training at the Goodyear flying field at Akron, Ohio. Classes were continued there throughout the war.

In August, 1917 two officers were sent to England for instruction in airships at the Royal Naval Air Station, Cranwell. Later a class of 15 reserve officers were sent to France for instruction in French methods. The French party eventually took over the air station at Paimboeuf and operated it as an American station. The pilots trained in England operated with the British and were eventually sent to France after the establishment of other stations along the French coast.

During the year 1917 the Cacquot type of kite balloon was built in this country and placed in service. A part of the classes at Akron, Ohio, took up kite-balloon work. Lighter-than-air facilities were planned for and established at stations along the coast of the United States, at the Panama Canal, along the west coast of France, and the coast of Ireland.

Airships of French types were contracted for in France and purchased from the French Navy for use abroad, and certain types of British and French non-rigid airships were secured and brought to the United States.

Five hundred kite balloons of the Cacquot French R type were contracted for, and later on a shift was made to the British M type balloon, as it was considered more suitable for towing at sea. Winches, cable etc., were developed, and a policy was established relative to the use of kite balloons in connection with all types of surface craft capable of handling them.

During the summer of 1919 a semirigid purchased in Italy was delivered, erected, and flown at the Naval Air Station, Cape May, N. J.

Upon the request of the Army four dirigibles have been supplied that service and arrangements have been made to provide the Army with four airships of the D class.

Designs and plans had been under development since 1916 by the Bureau of Construction and Repair for a rigid airship. In 1920 the construction of such vessel was authorized in the United States. A site at Lakehurst, N. J., was selected for a station, and plans were made for the erection of the world's largest airship shed at this point.

The hangar at Lakehurst is under way and will be completed this year. The present airship shed at Cape May is being enlarged to provide for the housing of a rigid airship.

Arrangements were begun for the purchase of the rigid airship *R-28* in England. In 1920 the purchase of the *R-38* in England was authorized and arrangements were made for the instruction of personnel, both officers and men, in rigid airships. Eight officers and 18 men are now in England receiving rigid-airship instruction.

The construction of fleet airship No. 1 in the United States has been undertaken and is steadily progressing. It is hoped that the naval appropriation for 1921 will provide for one rigid airship and another large two-ship shed which may be erected on the west coast.

Radio.—The advancement of aircraft radio communication during the period of the war may be indicated by comparing the results attained before and after. The best record made before the war, transmitting from aircraft, was over a distance of 150 miles and no receiving apparatus was installed. This was experimental work and the installation weighed 100 pounds.

On the trans-Atlantic flight the radio installation of the NC seaplanes consisted of two transmitters, arranged for transmitting both in the air and on the water, a receiver and a radio compass. Two-way communication was maintained with a short station over a distance of 700 miles. The seaplanes were heard at the Bar Harbor, Me., receiving station from a distance of 1,400 miles. The entire equipment weighs 200 pounds.

During the war four different types of radio telephone transmitting apparatus were designed with the end in view of dispensing with the radio operator from the crew of the various seaplanes and allowing the pilot or observer to communicate direct without being expert in the telegraph code. A series of tests were conducted in March, 1919, demonstrating the possibilities of maintaining telephone communication direct from the desk of the commanding officer of a naval-air station and a flying boat out on patrol, wherein a two-way telephone conversation was carried on from the desk of the Secretary of the Navy, through the telephone exchange, using a standard desk telephone which controlled a radio telephone transmitted at the Washington Navy Yard and a Navy flying boat, which was flying over Chesapeake Bay, a distance of 60 nautical miles.

Radio compass.—The radio compass as installed upon seaplanes was in a fully experimental stage at the beginning of the war. During the summer of 1918 the experiments led to the installation of a "tall coil" as previously used. This overcame the necessity of varying the course of the plane in order to get a reading on the beacon station, and the success of the new type was definitely established in the trans-Atlantic flight when the seaplane NC-4, 40° off her course, was brought back to her true course by means of readings taken with the radio compass.

Instruments.—At the declaration of war the Naval Observatory furnished three classes of instruments (altimeters, clocks, and compasses) for aviation purposes, at the signing of the armistice there being issued 35 different instruments and two entirely new fields had been developed, namely, photography and aerography, and of the three classes of instruments originally furnished, all had been altered, modified, or improved and none of the types in any one of the original classes of instruments was still in use.

Other Steam Engineering activities.—The following indicates briefly some of the aviation activities of the Bureau of Steam Engineering:

Power plants.—At the beginning of the war, as the aviation policy of the Navy Department began to shape itself and real facilities for the production of aircraft became a necessity, an organization was formed under the Bureau of Steam Engineering that could design all naval aircraft power-plant material and balloon-gas equipment, as well as handle its production, operation, and maintenance. By this means the most important items of the power-plant equipment were handled directly by the bureau and manufactured in the plants best equipped for the purpose and sent to the aircraft builder for installation. This expedited the production work greatly as well as it accomplished a large saving in cost. For this purpose, 40 officers, in addition to the necessary civilian force, were necessary under the Bureau of Steam Engineering, and 150 officers, with the necessary civilian employees, were necessary for inspection in the field. All of these officers except one were from the reserve force.

During the war the Navy pooled its power-plant aviation requirements with those of the Army wherever possible. This included instruments, accessories, propellers, radiators, raw materials, and, particularly, engines and engine parts for service machines.

The Liberty engine was adopted as standard equipment by the Navy, in order to eliminate the very serious objection of having a number of different types of engines in the field and to conserve the supply of raw materials in the United States. The whole Liberty-engine production was placed in the hands of the Army, the Navy being allocated its share. The Navy adapted the Liberty engine to its machines with marked success from the time it received its first engine, got the first Liberty engine into the air in an HS flying boat at Buffalo, and continued the use of the engine with excellent results during the war.

There was under development during the war by the Navy the following experimental engines: (1) The Kessler supercompression 125, 200, and 400 horsepower engine; (2) the Lawrance 60-horsepower air-cooled static radial engine; (3) the Duesenberg 850-horsepower engine; (4) the geared Liberty 400-horsepower engine.

The Kessler engine gave great promise, but its mechanical difficulties never allowed it to get out of the embryonic stage. The Lawrance engine turned out splendidly and will form the foundation of the development of larger air-cooled static radial engines. European countries have been ahead of us in this respect, but the Lawrance engine is the best of its type. Lawrance is now going ahead with a 200-horsepower experimental engine. The Duesenberg engine was the first engine of its power, and made very good progress up to a certain period, when mechanical and ignition troubles held back its complete development. The liquidation of the Duesenberg Co. stopped the engine work at that plant. The geared Liberty engine development was carried on by the Army for the Navy during the war, but not much real progress was made. The Navy has handled this work since the armistice, and the engine is now being produced. This engine will be a great advance over the direct-drive Liberty engine for naval use, and it is of interest to note that by fitting gearing to the Liberty engine the great criticism that the Germans made of this engine will be overcome. The Navy took up the gearing of this engine sometime prior to the time that the Germans issued their report on the Liberty engine.

With the aid of the British air force, the Navy Department was able to produce a very successful type of leak-proof gasoline tank for use on the Navy

fighting planes. This tank would have prevented machines from taking fire from incendiary bullets fired into the fuel tanks.

The question of starting the engines of seaplanes and flying boats was always a problem with the machines in the water. The Navy developed the electric starter for aircraft engines and successfully applied it to various types of naval aircraft.

The use of steam for the propulsive machinery for aircraft has drawn the attention of engineers since aviation began. The Navy began the investigation of this matter in this country, and in March, 1919, the department authorized the expenditure of \$50,000 to carry out the work. The funds have been increased until a total of \$95,000 has been allotted. The investigation is encouraging as far as the successful construction of a steam plant that will take the air is concerned. The advantages of the practical application of steam to aviation can not be definitely established without aerial experience with the apparatus.

In lighter-than-air work, the Navy applied a hydrogen carburetor for the purpose of consuming in the engine the hydrogen that usually is valved from the dirigible envelope to equalize the life which is disturbed by the consumption of the gasoline fuels. This device was first used in the dirigible C-5 for the proposed trans-Atlantic flight, and was of material assistance in increasing the radius of action of that dirigible.

In connection with the above, the Navy has also developed an apparatus that will condense the water from the exhaust gases of the engine. It is possible to obtain about 1.35 pounds of water for every pound of gasoline burned. The saving of this water would mean that no hydrogen or helium would have to be released from the dirigible envelope to equalize the excess lift caused by the use of fuels. The apparatus that will do this has been successfully devised, but its application to an actual airship is still to be made. There are still practicable difficulties due to weight and head resistance involved.

The Navy developed the Union engine for dirigible use. This engine is conceded to be as satisfactory as any engine of its power in use to-day.

Engine development.—The Navy has investigated or used, among others, the following makes of engines up to and including the period of the war:

Aeromarine, Ashmussen, Bugatti, Clerget, Curtiss, Duesenberg, Fiat, Gnome, Gyro, Hall-Scott, Isotta-Fraschini, Hispano-Suiza, Kessler, Knox, Lawrance, Liberty, Le Rhone, Muffley, Orlo, Packard, Roberts, Rolls-Royce, Sunbeam, Sturtevant, Thomas-Morse, Wisconsin, Wright.

While each one of the above engines which was developed at the beginning of the war possessed merit along certain lines, a careful survey of the aviation engine field at the time showed none of the American engines had all the qualifications which would fit it for use in war service by either the Army or the Navy. There was no foreign engine of sufficient power and proved reliability which would withstand transplanting to the United States to be manufactured in the quantities which would allow this country's air service to be a factor in the war. The marked military advantage to be gained by having one type of engine for aviation led the Navy to join the Army in the development of the Liberty engine, and to place the production in the hands of the War Department. Identical types of the Hall-Scott and Hispano-Suiza engines were used in common by the Army and Navy, and the production of these was also placed in the hands of the War Department by the Navy. This action was taken to avoid all competition, and to utilize all airplane-engine industries to the utmost. The Union engine, and the Curtiss 100 and 200 horsepower types were not used by the Army, and the Navy handled the production of these engines directly.

Engines—Types employed.—The Navy concentrated its engine requirements mainly on the following types:

Curtiss 100 horsepower.
Curtiss 200 horsepower.
Hall-Scott 100 horsepower.
Hispano-Suiza 150 horsepower.
Liberty 400 horsepower.
Union 120 horsepower.

There were under construction experimentally: Duesenberg, Kessler, Lawrance which were hoped to be useful for war purposes.

Engines used by Navy.—On July 1, 1918, the Navy possessed, or had on order, the following aviation engines:

1300 Curtiss 100 horsepower.
360 Curtiss 200 horsepower.
200 Hall-Scott 100 horsepower.

620 Hispano-Suiza 150 horsepower.
 4,000 Liberty 400 horsepower.
 90 Union 120 horsepower.
 2 Duesenberg 850 horsepower.
 10 Kessler 120 horsepower.
 5 Kessler 200 horsepower.
 3 Kessler 400 horsepower.
 3 Lawrence 60 horsepower.

Subsequent to July 1, 1918, the following additional engines have been ordered:

450 Hispano-Suiza 150 horsepower.
 80 Hispano-Suiza 180 horsepower.
 122 Hispano-Suiza 300 horsepower.
 10 Lawrence 60 horsepower.
 5 Lawrence (experimental) 200 horsepower.
 280 Liberty 400 horsepower.
 13 Union 120 horsepower.
 4 Curtiss K-12 450 horsepower (experimental).

A tentative order of 400 Curtiss K-12 engines was also placed. This order was dependent upon the successful performance of the engine on test, which was never accomplished.

The Navy has also gone ahead with the experimental development of the geared Liberty engine, and has had 200 sets of gears manufactured. These will be used to convert 200 of the Navy's direct-drive Liberty engines into geared engines.

NC power plant.—The power plant development for the trans-Atlantic flight is worthy of some attention as an aviation engineering accomplishment by the Navy Department. It was necessary to install four engines in the planes that were originally designed for three engines, in order to be able to get the maximum load into the air. This involved installing two engines in tandem, and as the data on this was very meager, it was necessary for the Navy to pioneer the way. The efficiency of the propellers had to be compromised between a design that would lift the maximum load from the water and give a maximum economy in flight.

The engine economy had to be such that the distance to the Azores could be made in one flight with a slight margin to spare. By special carburetor settings and increasing the compression of the engine, the necessary fuel economy was obtained, and by the design of several sets of experimental propellers a combination was reached that allowed the Azores to be reached with a margin of 340 knots.

Helium.—The importance of the development of helium for use in lighter-than-air craft was early recognized by the Navy Department, and effective and energetic action was taken by the department in carrying on the helium project. The Navy Department has taken a leading part in the work, and certain personnel under the Bureau of Steam Engineering were designated by the Aircraft Board to supervise, in behalf of the Army and Navy, the funds which were allocated to the helium project. The Navy Department was assigned the task of building the helium production plant and the supervision of its operation.

Hydrogen generators.—The Navy developed, with the aid of certain French photographs and line drawings, and built the only portable hydrogen generating apparatus ever constructed in this country. These plants took care of the hydrogen production on all of the naval air stations in the United States. These plants were very successful, are in use to-day, and their successful development was a very creditable piece of engineering. The hydrogen practice of the Naval Service at the time of the signing of the armistice was found to be ahead of that which obtained abroad. This was largely brought about by following the advice of the foreign hydrogen experts. In all cases, they advised what they considered the ideal practice, and, as our service was new, we were able to follow their advice. It may be noted that during the war, the Navy did not have a single accident due to hydrogen, its equipment, or the methods of carrying on hydrogen operation.

Speed boat.—The Navy cooperated with Dr. Alexander Graham Bell in the development of a shallow craft boat to go over mine fields and to chase submarines. The final successful results were not accomplished until after the war need for the boat had passed. A craft known as the *HD-4* was constructed.

This boat was supported on hydrofoils, and was propelled by two Liberty engines, each power plant installation being identical with that used on the HS type of naval flying boat. The boat weighed 11,000 pounds fully loaded, made a speed of 70 miles per hour, and drew but a very few inches of water when at top speed.

Early development of aviation ordnance.—Prior to the outbreak of hostilities in the World War most of the developments in aviation ordnance were purely experimental. No satisfactory type of machine gun or airplane cannon had been developed. Such bombs as had been used at all were small in size and were not standardized in any way, either as to shape, method of fusing, or means of launching. Bomb sights were extremely rudimentary, usually consisting simply of a fore and back sight with approximate means for setting for altitude and for speed.

As aviation activities became of more and more importance with the experience of the war, it became more and more evident that aircraft, in order to obtain their maximum efficiency, must be fitted for both offensive and defensive operations as well as for scouting and reconnaissance work. Early endeavors along this line resulted in the arming of planes with rifles, pistols, and even with shotguns which were operated by the observer or by the pilot without any form of mount or any suitable sight.

These makeshifts did not prove satisfactory and there were gradually evolved various forms of mounts and sights. The Lewis machine gun and the Vickers machine gun were among the most successful types finally developed for this work and the scarf ring mount in practically its present form was found to be a satisfactory means of mounting a mobile gun. Fixed guns so arranged that they fired through the propeller with suitable timing gear to prevent the bullets from striking the propeller blades were gradually developed and were soon in successful operation.

Gun sights.—Gun sights which automatically compensated for the speed of the plane on which they were mounted and which embodied various means of compensating for the movement of hostile aircraft were brought into use and at the end of hostilities the Norman wind vane sight and the ring rear sight were in common use. A unit power telescope with graduations corresponding to the markings of the ring rear sight was also introduced and was preferred by many pilots.

Large-caliber guns.—The mounting of large-caliber guns and of cannon on aircraft was taken up later in the war, and cannon of 37, 47, and 75 millimeter caliber were successfully operated from aircraft by the various nations involved. Sights used on these cannon were usually automatic, compensating for the displacement due to the movement of the gun through suitable arrangements of cams and moving parts.

Ammunition.—Ammunition was developed to meet the varying needs; including, in addition to the ordinary machine-gun bullet, various types of tracer ammunition, which left a trail visible for several hundred feet and which was usually loaded in the proportion of one to four or five of the regular ammunition. At the close ranges at which aerial combats were held, this tracer ammunition afforded a valuable check on the accuracy of pointing with the sight. For attacking lighter-than-air craft and kite balloons, incendiary ammunition was developed, which was also used against the gasoline tanks of hostile airplanes. Supersensitive fuses, which would explode on impact with a wing surface or with the light framing of an airplane, were developed, as were armor-piercing bullets for use against planes which were fitted with light armor.

Protection against attack by gunfire.—To meet these varied forms of attack means were devised for rendering gasoline tanks leak proof and fire-proof by the use of coatings of rubber or other self-sealing substances. Planes constructed entirely of metal and planes carrying armor for the protection of the personnel and of the vital parts were also beginning to appear toward the end of the conflict.

Bombing.—One of the first possibilities of the use of aircraft for offensive purposes was seen to be in the dropping of explosives. At the outbreak of the war, bombs in the neighborhood of 50 pounds total weight had been experimentally in this country, and the British air forces had a standard bomb weighing about 65 pounds. As the carrying capacity of aircraft became greater the sizes of the bombs in use were rapidly increased. Much experience was obtained in the work against submarines and it was early discovered that bombs of the small size first employed were useless against

large, strongly-built submarines. The British first increased their bomb to 100 pounds, then to 230 pounds, and later to 520 pounds for routine work in antisubmarine patrols. The history of bomb development in the French antisubmarine service was practically the same. The French started with a bomb weighing about 52 kilograms, then went to 75 kilograms, and then to 150 kilograms in weight. In this country the first bomb used in anti-submarine patrols weighed about 163 pounds. This was shortly followed by bombs weighing 230 pounds, 270 pounds, and at the end of hostilities bombs of 520 pounds weight, patterned after the British designs, were under construction.

For bombing on shore, various types of demolition and fragmentation bombs were developed. At the time of the cessation of hostilities heavy case bombs of 112, 250, and 550 pounds weight were in daily use in large quantities, and bombs weighing 1,000, 2,000, and even 3,000 pounds had been produced experimentally with entire success, and would doubtless have been in common use had hostilities continued for a longer time.

Bomb sights.—The development of bomb sights called forth the best talent available in every service concerned. Many elements enter into the construction of a satisfactory and accurate bomb sight and designers in various countries have approached the problem from many different angles. For land work the Wimperis high-altitude sight and the French Michelin sight were probably among the most successful in use. In the early days of bombing it was essential that the aircraft be moving either with or against the wind as none of the early sights were designed to permit of bombing accurately when drifting across the wind. This fact made bombing difficult as it necessitated approaching the target along one or two directions which could be anticipated by the antiaircraft forces. Maj. Wimperis, of the English Air Service, developed and produced the first sight which could be used without regard to the direction of the wind. This sight was being produced in England about the time this country entered the war and it was immediately taken up by the United States Navy Department, improved, developed, and manufactured in this country for use with American flying boats and seaplanes. Thirty-five hundred of these sights were contracted for, the number being afterward reduced to 2,200 to suit conditions at the time of the armistice.

Supply to forces overseas.—American naval air forces operating in European waters obtained the larger part of their ordnance equipment from overseas as the countries in which they were serving were able to supply material needed and it was the department's policy to use the space in vessels crossing the Atlantic for other equipment which was more badly needed. Naval air forces operating from stations in the United States were completely equipped with material manufactured in this country. Approximately 16,000 bombs of all sizes were manufactured with the necessary gears and fittings for the large program of aircraft they were to arm. Machine guns, mounts, sights, and training devices of various kinds were supplied in adequate quantities. Machine guns and ammunition and a few antisubmarine bombs were shipped abroad. Toward the end of hostilities the so-called northern bombing squadron was formed for the purpose of bombing Belgian naval bases occupied by the Germans. The United States Navy and Marines were to operate in conjunction with the British air forces in attacking these bases. Bombs to be used in this program were to be manufactured and loaded in the United States and production on them was about to commence at the time of the signing of the armistice.

Developments since the war.—In this country experimental development of large size and of heavy case bombs has been continued. One of the most important developments under way is the construction of a machine gun for airplanes of larger size than the standard .30 or .303 caliber gun previously in use. Many cases were noted during the war of machines returning from service with large numbers of .30 caliber bullet holes that had not been sufficient to put them out of action. The need of a larger machine gun is evident and a .50 caliber gun along the lines of the Browning machine gun is being brought out and should be ready for issue shortly.

Improvements in bomb sights is being continued and both the Army and Navy are cooperating to standardize the various types of bombs, fusing components, bomb gears, etc., with the idea of avoiding duplication, reducing the number of types in use and of making these types interchangeable between the Army and the Navy.

A recent addition to the Navy's list of aviation ordnance equipment is to be found in the synchronized machine guns mounted on small planes in use with

the fleet. During the war practically all of the Navy's flying activities were concentrated on antisubmarine controls and convoy work. Since that time small land type flying machines have been installed on ships of the fleet and ordnance equipment for them following the lines of combat planes developed for work on land has become necessary and has been supplied.

Personnel, 1917-18.—In the United States at the outbreak of the war the number of trained aviators or of persons at all familiar with aviation was small. The early training of pilots and mechanics has covered only the flying of aircraft, without the requirements added through the operations of combat. For the purposes of the war, in order to operate successfully the bombs and machine guns making up the armament of aircraft, numerous trained crews composed of pilots, machine gunners, and observers became necessary. In addition, a very large force of so-called trained ground personnel was required. The enrollment and training of the tremendous numbers of men and officers demanded was in itself a task of stupendous magnitude. To carry this work on while active operations were in progress added vast complications to the problems confronting those charged with these responsibilities.

The strength of enlisted and commissioned personnel of the Navy and Marine Corps assigned to aviation duty on April 6, 1917, and the same as of November 11, 1918:

	Apr. 6, 1917.	Nov. 11, 1918.
Navy:		
Officers (naval aviators).....	38	1,656
Officers (student naval aviators).....		28
Officers (ground).....		891
Student officers (under training for commission).....		3,881
Total officer personnel.....		6,716
Men (aviation ratings).....	163	21,951
Men (general ratings assigned to aviation duty).....		8,742
Total enlisted personnel.....		30,693
Total personnel.....		37,409
Marine Corps:		
Marine officers on aviation duty.....	5	282
Enlisted men (marines) on aviation duty.....	30	2,150
Total personnel.....	25	2,432

On the date of the armistice Naval Aviation had sent abroad the following personnel:

Officers.....	1,237
Enlisted men (aviation ratings).....	8,215
Enlisted men (aviation duty—miscellaneous ratings).....	8,072
Total personnel.....	17,524

Casualties.—The total Naval Aviation casualties during the war amounted to—

Abroad:	
Officers.....	36
Men.....	86
Total abroad.....	122
At home:	
Officers.....	38
Men.....	48
Total at home.....	86
Total.....	208

MARINE CORPS AVIATION.

Marine Corps aviation began on May 21, 1912, when Lieut. Alfred A. Cunningham, United States Marine Corps, was ordered to join the four pilots comprising at the time Naval Aviation. Some six months later Lieut. Bernard L. Smith, United States Marine Corps, was also ordered to aviation duty. Shortly after May, 1912, several marine enlisted men were ordered to aviation duty, forming the nucleus of the present marine section of Naval Aviation. This personnel was gradually added to, and has operated continuously since that time with Naval Aviation at Guantanamo, Cuba; Vera Cruz, Mexico; in Haiti, and in Santo Domingo.

On April 6, 1917, the marine section of Naval Aviation consisted of 5 officers and 30 enlisted men stationed as part of the complement of the Naval Air Station, Pensacola, Fla. In October, 1917, the First Marine Aeronautic Company, consisting of 10 officers and 93 enlisted men, was organized to perform antisubmarine patrol duty. On December 7, 1917, this company, consisting of 12 officers and 133 enlisted men, were ordered to naval base No. 13, Ponta Delgada, Azores, and operated as an antisubmarine patrol until January 24, 1919, when they were returned to the United States. This company was the first completely equipped American aviation unit to leave the United States for service in the war.

On October 17, 1917, the First Aviation Squadron of land flyers was organized, and training was carried on at various fields.

On July 13, 1918, the First Marine Aviation Force was organized at the marine flying field, Miami, Fla., consisting of Squadrons A, B, C, and D, and headquarters company. This organization was trained to perform the day bombing work of the proposed northern bombing group, and consisted of 182 officers and 1,030 enlisted men. It sailed from New York City for France on July 18, 1918, and arrived at Brest, France, on July 31, 1918. The organization proceeded at once to aerodromes situated between Calais and Dunkirk. The First Marine Aviation Force was completely trained, organized, and ready for service when it arrived at the front. When the northern bombing group headquarters was organized, the First Marine Aviation Force became known as the day wing, northern bombing group, and performed service both with the British aviation squadrons at the front and also independently. The total number of raids made by Marine Corps personnel was 57, 14 of these being carried out by the day wing independently of other organizations.

The organization participated actively and creditably in both offensives on the Flanders front, carried out raids from behind the enemy lines, did considerable damage, and brought back valuable information. A feat worthy of mention was performed by Marine Corps pilots. A French regiment was cut off by the enemy near Stadenburg, and it was decided to attempt to feed them by airplane. Marine Corps pilots loaded up with food and flew low over this isolated regiment and successfully dropped 2,600 pounds of food to them in the face of heavy fire from artillery, machine guns, and rifles. This process was continued for two days until the regiment was rescued. So far as is known, this is the first instance where troops under fire have been fed by airplane.

The following is a condensed report of the operations of the day wing, northern bombing group:

Number of raids participated in by marine flyers serving with British and French	43
Total number of bombing raids completely marine	14
Total pounds of bombs dropped	52,000
Number of food raids	5
Pounds of food dropped	2,600
Number of enemy aircraft shot down	12
Number of casualties:	
Officers	9
Enlisted men	20

TRAINING.

Slight thought will give an idea of the immense organization necessary to train the thousands of young men who volunteered for and were assigned duties as officers and as mechanics in the Air Service of the Navy during the

World War. The problem was attacked vigorously and within six months training classes were in full operation at the following schools and stations:

Schools—

Massachusetts Institute of Technology, Cambridge, Mass.

Dunwoody Industrial Institute, Minneapolis, Minn.

Columbia University, New York City.

University of Washington, Seattle, Wash.

Aviation detachment, Akron, Ohio.

Naval aviation detachment, Great Lakes, Ill.

Stations—

United States Naval Air Station, Pensacola, Fla.

United States Naval Air Station, San Diego, Calif.

United States Naval Air Station, Bay Shore, Long Island.

United States Naval Air Station, Rockaway, Long Island.

United States Naval Air Station, Hampton Roads, Va.

United States Naval Air Station, Miami, Fla.

Aviators received preliminary training in naval customs, discipline, and technique at the Massachusetts Institute of Technology. This course lasted for three months. The school opened on July 23, 1917. In December, 1917, the course was enlarged to include an inspector's courses for planes and for motors and in aerography, in addition to flight and ground training.

Because of the fact that the school at the Massachusetts Institute of Technology was crowded to capacity, similar schools were established at the University of Washington, at Seattle, and at the Dunwoody Institute.

Under the direction of Dr. C. A. Lucke, a gas-engine training school was established at Columbia University, New York. Students other than those engaged on gas-engine work were sent to naval schools at various stations.

The United States naval air station at Pensacola, Fla., was the largest aviation training station operated by the Navy. Its facilities were utilized to the fullest extent. Those who could not be given flight and operative training at Pensacola were sent to Chatham, Bay Shore, Rockaway, Hampton Roads, Miami, Key West, Akron, and San Diego.

Enlisted men.—Enlisted men for aviation duty were detailed to the various naval air stations above listed and there trained in aviation and in naval procedure.

A school for aviation mechanics was established at the United States naval training station, Great Lakes, Ill. To this school mechanics who had been selected for special qualifications were sent for advanced training. It became one of the largest and, perhaps, one of the most successful manual training schools in this country, if not in the world.

At the time of the signing of the armistice there were 16,287 enlisted men performing duty either in aviation ratings or aviation duty under miscellaneous ratings. Practically all of these, as well as 7,000 officers, were trained during the period of hostilities.

Shore stations, 1917-18.—The list of shore stations established for aviation at home and abroad by the Navy and Marine Corps on April 6, 1917, and the number maintained on November 11, 1918, is given below:

Shore stations maintained for aviation April 6, 1917:

One station only, located at Pensacola, Fla.

Shore stations, schools, and detachments maintained for aviation November 11, 1918:

America:

Anacostia, D. C., experimental station.

Bay Shore, Long Island, preliminary flying school and emergency patrol station.

Brunswick, Ga., patrol station.

Cape May, N. J., patrol station, lighter than air.

Chatham, Mass., patrol station, lighter than air.

Coco Solo, Canal Zone, patrol station, lighter than air.

Dunwoody Institute, Minneapolis, Minn., ground school.

Hallifax, Nova Scotia, patrol station, heavier than air.

Hampton Roads, Va., patrol station, heavier than air.

Key West, Fla., preliminary flying school and heavier than air and lighter than air patrol station.

Marginal Parkway, N. Y., supply station, lighter than air.

Massachusetts Institute of Technology, ground school.

Miami, Fla., preliminary flying school and heavier than air and lighter than air patrol station.

Miami, Fla., marine school, land-flying instruction.

Montauk, Long Island, patrol station, heavier than air and lighter than air.

Morehead City, N. C., patrol station, heavier than air.

North Sydney, Nova Scotia, patrol station, heavier than air.

Pensacola, Fla., advanced ground and flight school.

Rockaway, Long Island, patrol station, heavier than air and lighter than air.

San Diego, Calif., preliminary flight school.

Seattle, Wash., ground school.

Great Lakes, Ill., mechanics' school.

Azores:

Ponta Delgada, Azores, advanced base and detachment marines.

France:

Autinges, headquarters northern bombing group.

Campagne, Navy night-bombing field—never commissioned—two hangars erected.

Le Frene.

St. Inglevert.

Oye, day-bombing field—Marine Squadrons 7 and 8—northern bombing group.

Bois en Ardres, day wing—Marine headquarters, northern bombing group.

Arcachon, patrol station, heavier than air.

Brest, kite-balloon station.

Dunkerque, patrol station, heavier than air.

Fromentine, patrol station, heavier than air.

Gulpavas (Brest), dirigible station.

Gujon, dirigible station.

Ile Tudy, patrol station, heavier than air.

L'Aber Vrach, patrol station, heavier than air.

Le Croisic, patrol station, heavier than air.

La Pallice, kite-balloon station.

La Trinite, kite-balloon station.

Moutchic, heavier-than-air flying and ground school.

Palmboeuf, dirigible station.

Paulliac, assembly and repair base.

St. Trojan, patrol station, heavier than air.

Tregueir, patrol station, heavier than air.

Great Britain:

Berehaven, kite-balloon station.

Eastleigh, assembly and repair base.

Lough Foyle, patrol station, heavier than air.

Queenstown, assembly and repair base and heavier-than-air station.

Wexford, patrol station, heavier than air.

Whiddy Island, patrol station, heavier than air.

Italy:

Porto Corsini, bombing and patrol station, heavier than air.

Lake Bolsena, flight and ground school.

Total, 53.

Results.—A query which will be raised in the future—already it has been suggested—as to whether or not the vast expenditure of funds and the tremendous amount of labor involved in the creation of air bases at home and in foreign lands were worth while. These will probably remain mooted points which can never be satisfactorily and definitely settled. When considering the financial side of the question, the fact that the expense of projects was considerably reduced by the liquidation of materials and equipment should be kept in mind.

Positive results would seem to indicate that expenditures of money, effort, and time were not wasted. In the records which have been compiled it will be noted that previous to the establishment of this great aviation activity on the French coast submarines frequented these waters. The losses of shipping were considerable from the effects of torpedo, gunfire, and exploding mines. With the establishment of the United States aviation stations in France the submarine ceased its work of destruction near the shores and only sporadic and generally ineffective hostile activity on the part of these vessels occurred in coastal waters. Aviation, of course, can not claim full credit for this result. It will share, however, with the adoption of a daylight system of convoys, and the im-

proved methods for escort by surface craft, the credit of having eliminated the enemy from this, a former fertile field for his endeavors. After the establishment of the United States naval air stations in France not a single convoy, escorted by aircraft, either French or American, were successfully attacked by a German submarine on the western shores of France. The number of allied vessels lost through submarine agency on the French coast during this period has been insignificant. One can not measure properly the success of aviation in this neighborhood by the number of submarines sighted or sunk. A better standard is that based on the number of ships which have not been destroyed by the enemy. Certainly aviation has produced tangible and direct results when measured by this criterion.

Another and perhaps equally important feature has been the moral influence upon the enemy as well as upon the Allies of the successful prosecution of a tremendous enterprise. There is every reason to believe that the Central Powers were fully aware of what was being undertaken. Our allies were kept well informed of what was going on. The knowledge that the work was being pushed with determination and that the United States had the firm resolve to make the naval aviation force a powerful and aggressive influence must have been a potent factor. Everywhere in the neighborhood of stations a change became noticeable in the attitude of local inhabitants as our centers sprang into existence and grew in response to the efforts of the hundreds of enthusiastic and active men making up their crews. There can be no doubt that this moral influence was enormous. That it had a positive effect upon the result of the war there can be no question.

It is true that money could have been saved had the enterprise been cast in a smaller mold and had it been prosecuted less vigorously. At the time of its conception no one had an idea that the force of our enemies could collapse as it did, and stations were erected with the view that hostilities might continue for a much longer period of time than proved to be the case. Success was achieved and the results desired obtained. Of this there is certainty. What might have been had other plans been followed must always remain a mere surmise.

At the close of hostilities practically all of the United States stations abroad were in operation or were prepared for operation. It is true that deficiencies and defects existed, but these are ever present companions. In lighter-than-air craft particularly there were serious deficiencies in material equipment. These latter were being filled as rapidly as practicable through contracts placed in France for vessels of this class.

The credit for the carrying on and the completion of the work of aviation belongs essentially to the young men who joined the service from civil life. Unfamiliar with naval methods and entirely unaccustomed to the curious existence which, in many cases, became theirs in isolated districts, their efforts everywhere provoked the most enthusiastic acclamation. Breaches of discipline were very rare, and it is believed that the personnel of aviation quit the scenes of its activity retaining everywhere the admiration and respect of the foreign people with whom they were associated.

To the flying personnel the highest commendation belongs. No instance of flagging or failure in attempting the dangerous work assigned them was ever noted. Many paid the supreme sacrifice in their devotion to duty, and the skill and courage with which all acquitted themselves everywhere was praised by the older flyers of the allied services with whom our young men were associated.

Aviation left the scene of its activities everywhere with pride in its work born as a result of successful achievement, of having been a part of the Navy, and of having assisted the Navy to bring to a conclusion the stupendous problem assigned that service during the World War.

Purposes.—Before outlining the achievements of naval aircraft during the war, it is, perhaps, well to indicate the purpose which prompted the Navy to undertake an extensive aviation project.

The first year of the war between the Allies and the Central Empires clearly demonstrated the effectiveness of the development of design for subsurface seagoing vessels as well as of aircraft. The submarine, after the first few months of the conflict, proved to be the sole efficient agent available for the conducting of hostilities at sea by the Central Powers. These craft cruised practically at will, and with torpedoes, mines, and guns created havoc with the commerce of the Allies, and through their dangerous agency a blockade of the French and English coasts was declared. To combat the submarine, mer-

chant vessels were armed; a system of surface patrol was inaugurated; the plan of ocean convoy was reviewed, and mine fields and mine barrages for opposing the activities of these vessels were created.

The development of the motor which permitted undersea navigation also produced a tremendous advancement in aviation. It is not necessary here to go into details with regard to this advancement or to take up the arguments pro or con on the utilization of various forms of aircraft for antisubmarine warfare or the methods suggested for their employment. It is sufficient to state that at the time for the entrance of the United States in the World War the number of air stations on the coast of France, England, and Ireland, and in Italy was regarded as insufficient. The protection of the great number of American transports and cargo ships which were to enter that region made it absolutely necessary to increase antisubmarine operations in the war zone. With this object in view, negotiations were opened with foreign governments.

There were four modes of operating, as follows: Routine patrol; escort patrol to convoys; emergency patrol; and special bombing patrols over submarine bases.

Large seaplanes with an extensive cruising area were generally used for routine patrol. These planes carried either one or two bombs, weighing either 230 or 500 pounds each, and were also provided with machine-gun equipment. As a rule, smaller type aircraft were used for convoy escort. These, too, carried bombs and machine guns. A specially designated seaplane, always kept in readiness, was maintained at all times at the stations for emergency patrols. For bombing operations against submarine bases different types of planes were used; in some cases, especially in the so-called northern bombing group, land planes having been assigned to this particular work.

The method of operations of the patrols was as follows: Each naval air station had a certain defined zone of operation, and it was the duty of the officers in charge to so plot out their patrols that they would most effectually and thoroughly cover the sea area within their jurisdiction. This applied to the routine patrols. For the purpose of convoy escort the course to be followed by the seaplanes necessity was limited to the course traversed by the vessels and varied with the particular situation. An emergency patrol may be defined as one sent out to a precise location at sea in answer to advices of enemy activities presently existing at that point. A patrol against submarine bases was one despatched from a naval air station, either over land or over the sea, to a neighboring port at which submarine activities were concentrated. A routine patrol normally lasted an average of three hours, although in some instances there are records of routine patrols by seaplanes covering a period of five hours in duration, and a mileage of over 300 nautical miles.

The primary purposes of these routine patrols was one of search of enemy surface or under-surface craft. Their mission was wholly offensive in character, and required them to bomb all enemy craft encountered. The primary purpose of a convoy escort patrol was to cooperate with the destroyers and accompanying naval vessels in protecting troops and supply ships both in and out of allied ports.

These seaplane escorts to convoys were planned with reference to the speed of the convoy, and generally speaking, operated in a succession of oval loops covering the convoyed train. By the use of several planes following one another at stated intervals and keeping relatively the same distance from each other, the adjacent sea areas were thoroughly and continuously kept under observation. Operations by naval aircraft against submarine bases were carried out as follows: They were usually despatched by the shortest route possible to the objection, released their bombs, and as soon as possible returned to their home station.

Foreign development.—The first unit from the United States sent abroad during the World War was a naval aeronautical detachment on duty at Pensacola, Fla. On May 9, 1917, this detachment, consisting of 100 men and 6 officers under the command of Lieut. Commander Whiting, was ordered to proceed to France, where it arrived in June, the first complete military or naval unit from our country assigned to foreign service.

Negotiations with foreign authorities developed the line of action considered necessary for our aviation contingent, and we were at once urged to take up aviation extensively in France and England, and later in Italy. Patrol stations were soon established in the vicinity of shipping and transport areas, and

regular patrols and convoys by a seaplane or dirigible were begun. Usually, operations were carried on simultaneously with the work of constructing stations.

In building up aviation abroad a stupendous work was accomplished and completed in the face of serious obstacles, one of which was incident to conducting affairs in a strange country where both custom and language were different from those with which there was familiarity. Transportation in and from the United States was difficult, but it was even more difficult to ship materials from points on that coast to other points than to have them delivered in Europe directly from our home ports. Generally, aviation stations were constructed by our own forces, and men and officers, enrolled from every walk of life, were found well qualified to answer practically every call made upon them. In every instance, difficult situations were met and what oftentimes seemed serious obstacles were overcome by the grim determination and persevering efforts of the young men making up the Aviation Service, many of whom now have left the Navy and resumed their civil occupations.

FOREIGN OPERATIONS.

France.—In France the construction and operation of air stations were from October, 1917, until August, 1918, directly under the command of Capt. H. I. Cone, who was also in general charge of naval aviation forces foreign service. On August 1, 1918, the aviation forces in France with the exception of the northern bombing group were placed under the command of Rear Admiral H. B. Wilson, commander of United States naval forces in France.

Capt. T. T. Craven, as aid for aviation, on the staff of Admiral Wilson, was directly charged with all aviation matters. On August 1 Capt. H. I. Cone moved to London and became a member of the staff of Admiral Sims.

The success of naval aviation operations in France can be best shown by a statement of the antisubmarine section of the French ministry of marine bulletin, "de la Guerre-Sous-Marin," stating that during the last 10 months of the war three ships were torpedoed or destroyed by cannon in patrol areas between Point of Penmarch and Ile d' Yeu, whereas in the same region there was a loss of one ship a day before the aerial patrol service of the Loire was created. The remarks in a French official document regarding the results of our efforts in the district of the Loire is of interest. "The entrance into the service of the Franco-American patrols of the Loire, acting in absolute cooperation with the reorganized and increased surface patrols, broke the blockage by enemy submarines of the French coast, and enabled the authorities to receive accurate information regarding the location of enemy submarines, besides compelling them to cruise in regions where navigation was not very extensive."

The first American patrol in France was made at Le Croisic on November 18, 1917, and consisted of six French machines manned by American pilots, and the last patrol was made at Brest on December 13, 1918, upon the occasion of the President's arrival.

Material received from French.—It was necessary to procure a great deal of flying equipment abroad in order to expedite the commencement of operations. A considerable quantity of material was purchased in both England and France, but the greater part came from France. From this country we obtained a total of 135 heavier-than-air craft with engines and accessories. Twelve dirigibles were ordered from the French Government, the order for three of which was cancelled upon the declaration of the armistice. Aside from the above, an immense amount of equipment, such as bombs, bomb sights, and instruments was obtained.

Northern bombing.—The northern bombing group was organized for the purpose of bombing submarine bases in northern Belgium. The group was commanded by Capt. D. C. Hanrahan and was operated with and under the British control as a part of the aviation contingent attached to the Dover patrol. This group was composed of eight squadrons, divided equally into day and night bombing units, day bombing being assigned to the marines and night bombing to the Navy. This project operated with headquarters at Aultingues, France. Due to the scarcity and inadequacy of machines, operations of the northern bombing group were restricted until just before the armistice was signed. The first night bombing operation was carried out over the submarine shelters in Ostend in August, 1918. The first operation of the day wing took place on October 14, 1918, in the form of a bombing raid over the railway siding at

Thielt. In all, from the date of the first raid by the day wing until operations were suspended, eight raids were conducted by this wing and a total of 15,502 pounds of bombs dropped on enemy territory. The night wing dropped only 2,670 pounds, due to the unfitness of certain foreign machines purchased for night bombing work. In operations assisting the British, however, United States naval personnel dropped 60 tons of bombs on various naval and military objectives in Belgium.

Great Britain.—Operations in Great Britain were carried on by five stations, four being located in Ireland and one in England. The patrol station at Killingholme, in England, was placed in commission on June 30, 1918, and from that date until the signing of the armistice, under the direction of Commander Whiting, conveyed 6,000 allied vessels and covered approximately 60,000 miles upon 233 patrols. This station was intended primarily for the purpose of furnishing a base for conducting offensive operations in Heligoland Bight. Due to the inadequacy of machines available at that time, patrols of this area were not feasible; and pending the construction of machines capable of this duty, shorter patrol and convoy operations were carried on. During the progress of hostilities many of our pilots were loaned to the British forces and were everywhere praised in the highest terms.

In Ireland the United States aviation group was commanded by Commander F. R. McCrary, United States Navy, though in operation but a short time, the stations rendered important service and bombed seven enemy submarines incidental to their operations.

Italy.—In Italy, United States aviation forces were under the direction of the naval attaché, Capt. R. Train, with Lieut. Commander J. L. Callan in direct charge. Operations in Italy were confined to training of pilots and the operation of one station for offensive bombing operations against the harbor of Pola. The training school was first placed in commission February 21, 1918, at Bol-sena, Italy, and qualified a total of 73 pilots during the period of operation.

The first official flight at this station was made on February 23, 1918. The United States naval air station at Porto Corsini was placed in commission July 24, 1918, and the first official raid over Pola took place on August 21, 1918. Regular bombing raids and patrol operations over the harbor of Pola were conducted during the entire period of operation of the station until the signing of the armistice between Austria and Italy on November 4, 1918. A naval air station at Pescara was under construction at the time of the signing of the armistice, but was upon that date abandoned. All flying equipment used in Italy and the equipment of the stations taken over and operated by United States forces was provided by the Italian Government.

Following is a summary of the destruction and damage to German and Austrian submarines by American forces during the war reported in a recent dispatch received from Admiral Knapp:

The United States Navy is credited with 12 as possibly damaged; 2 possibly seriously damaged; 1 encountered, no record as to damage.

Following aircraft operated by United States naval aviation personnel should be given credit for destruction or damage to enemy submarines during the war:

ILE TUDY.

August 3, 1917, 5 miles northwest of Point Penmarch; pilot, Ensign Sprague; probably damaged.

April 28, 1918, 6 miles southwest of Point Penmarch; pilot, Ensign K. R. Smith; submarine reported by French as having been encountered.

May 16, 1918, latitude 50° 38' N., longitude 5° 20' W.; pilot, Ensign Stahyel; probably damaged.

July 5, 1918, 2 miles south of Point Ervilly; pilot, Ensign Rowen; possibly damaged.

September 27, 1918, 8 miles of Penmarch; pilot, Ensign Pou; probably damaged.

KILLINGHOLME.

August 9, 1918, definite position unknown; pilot, Ensign Schieffelin; probably seriously damaged.

August 22, 1918, 600 miles east Withernshot; pilot, Ensign Ives; possibly damaged.

July 9, 1918, latitude 53° 57' N., longitude 1° W.; pilot, Ensign Schleffelin; probably seriously damaged.

July 25, 1918, latitude 54° 7' N., longitude 4° E.; pilot, Lee; possibly slightly damaged.

DUNKIRK.

August 11, 1918, 27 miles southwest Dunkirk; pilot, Ensign DeCerne; probably damaged.

August 13, 1918, latitude 51° 17' N., longitude 1° 53' E.; pilot, Ensign Carson; probably slightly damaged.

WEXFORD.

September 21, 1918, latitude 52° 10' N., longitude 5° 52' W.; pilot, Ensign Froass; probably damaged.

October 11, 1918; latitude 51° 35' N., longitude 6° 32' W.; pilot, Ensign Garvey; probably damaged.

LOUGH FOYLE.

October 19, 1918, latitude 55° 40' N., longitude 7° 45' W.; pilot, Ensign Montgomery; probably damaged.

PORTLAND (ENGLAND).

March 25, 1918, definite position not known; pilot, Ensign McNamara; possibly damaged.

Results.—A total of 39 attacks on enemy submarines is accredited to naval aviation forces operating in European waters, and, in all, approximately 80 tons of bombs were dropped on enemy objectives.

When one considers the difficulties confronting those charged with the construction and operation of our air stations in foreign lands in time of war and in face of the tremendous obstacles incidental to transportation through submarine infested areas of all materials and personnel, one can not fail but to come to the conclusion that a great work was accomplished.

Drive on Paris.—On March 30, 1918, when the German drive on Paris looked to be very serious, the personnel of the naval aviation was offered to the Allies for services behind the lines for transport or other auxiliary work.

The following telegram, dated April 3, 1918, is of interest:

"Vice Admiral Bebon and Gen. Foch consider that present circumstances do not call for presence at front of this force, since they have at hand all forces needed. If such condition should arise, Gen. Foch will certainly call upon Admiral Sims and will accept offer. Gen. Foch thanks Admiral Sims most warmly for this new proof of the ardor with which the United States participates in the war. Minister of War and the Minister of Marine were informed of the offer.

"Above opinions are those of Gen. Foch and Admiral Debon, who are in accord. It is not deemed advisable to assemble and hold in readiness this force for possible use within fortnight. 15303." (Jackson to Wilson.)

UNITED STATES COASTAL OPERATIONS.

Operations on our own coasts consisted of the establishment of naval air stations, schools, and supply bases along the same fundamental lines of those created in the war zone. At the date of the signing of the armistice there had been established 10 air stations distributed at strategic points from North Sydney, Nova Scotia, to Key West, Fla., and one air station on the west coast in the Canal Zone. Regular daily patrols of all shipping and transport areas were carried out and aircraft were detailed to accompany all important convoys. During the year 1918 United States naval seaplanes flew a total of 40,883 hours on patrol duty, and upon training and patrol duty combined flew a grand total of 219,011 hours. Patrols during the last three months of the war covered 1,305,000 nautical miles. Lighter-than-air craft for the same period flew a total of 15,679 hours upon training and patrol duty. During the fiscal year

1918 lighter-than-air flight operations in the United States and Canada alone were as follows:

	Flights.	Hours.
Patrol flights:		
Airships.....	431	1,724
Kite balloons.....	311	3,421
Total.....	742	5,145
Flights other than patrol:		
Dirigibles.....	4,148	4,132
Kite balloons.....	2,224	4,168
Free balloons.....	862	1,325
Total.....	7,234	9,625

Peace achievements.—The following developments and achievements mark the results of naval aviation activities during the war:

The large NC type flying boat, capable of carrying very heavy armament, was successfully developed for long-distance war patrols. This boat was not finished in time to engage in active combatant operations.

The success of the design and construction of this machine was demonstrated in its utilization for the first Trans-Atlantic flight from Trepassey Bay and the Azores to Lisbon, Portugal, undertaken by three of the NC type in May, 1919. Two of the boats were forced down at sea due to navigational difficulties but one completed the flight successfully. The total distance of 4,513 land miles from the naval air station, Rockaway, Long Island, N. Y., to Plymouth, England, whence this plane was flown from Lisbon, Portugal (the official terminating point of the Trans-Atlantic flight) was covered in 53 hours and 31 minutes flying time. The flight started at 10 a. m., May 8, 1919, and ended at 10.22 a. m., May 31, 1919. This historic feat will always remain as a brilliant achievement for the United States Navy and for naval aviation.

On April 25, 1919, a twin-motored flying boat of the F-5 type, fitted with two direct-drive high-compression Liberty engines, made a nonstop flight of 20 hours and 10 minutes, during which time a distance of approximately 1,250 nautical miles was covered. This boat carried a crew of four and the total weight was approximately 16,200 pounds.

Another important achievement of naval aviation is the development of lighter-than-air craft of which the Navy possessed practically none at the declaration of war. During the war there was designed, constructed, and developed what is considered to be the most efficient nonrigid dirigible in present use. The C-5 of this class established what is believed to be a record flight for a nonrigid airship upon May 14 and 15, 1919.

The flight started at 8 a. m., May 14, 1919, at Cape May, N. J., and ended at 9.50 a. m., May 15, 1919, at St. Johns, Newfoundland. During this period a total distance of 1,022 nautical miles was negotiated, the actual time in the air being 25 hours and 50 minutes.

National Advisory Committee for Aeronautics.—In the act making appropriations for the naval service for the fiscal year ending June 30, 1916, a provision was incorporated establishing the National Advisory Committee for Aeronautics, and including the sum of \$5,000 for its purposes. This committee, of which Dr. C. D. Wolcott has been chairman, has rendered valuable service to the country in studying the scientific problems of flight and in advising upon matters difficult of solution, arising during the World War. The committee remains a valuable organization for the coordination of national aviation activities.

Aeronautical Board.—In October of 1916 the Joint Army and Navy Board on Aeronautic Cognizance was established to consider the questions relating to the construction of rigid airships in the United States. In January, 1917, the scope of the board was increased to include a number of subjects relating to aeronautics in the Army and Navy. The operation of the board was handicapped by being composed entirely of officers who had other duties. Accordingly, early in June, 1919, a new precept was prepared, to cover all phases of Army and Navy aviation activities, and one officer from both the Army and Navy were detailed to the board as working members to give their undivided attention to its functions. At the same time the name of the board was changed to the Aeronautical Board.

The duties of this board are to make recommendations concerning the coordination of the aeronautic work of the Army and Navy which is along similar lines—production, training, operation, selection of aviation bases and sites, purchase of material abroad, etc., and for the coordination of the aviation activities of the Army and Navy with other branches of the Government and civil aviation organizations.

A great service has been accomplished by the board toward bringing the two services in closer touch, in acquainting each with the activities of the other, in preventing duplication of work and installation, and in utilizing wherever possible the facilities of the other service.

Demobilization.—Immediately upon the cessation of hostilities and when it appeared certain that no further activity would be expected of naval aviation units, in so far as practicable, all outstanding contracts for construction, operation, and materials were cancelled; and steps were taken to demobilize personnel, to dispose of material, and to liquidate our properties. The property upon which stations had been situated were derequisitioned as promptly as possible, buildings were demolished or sold, and steps for the adjustment of claims arranged.

Abroad, the business of liquidation was placed in the hands of two boards—one with headquarters in London and the other with headquarters in Paris. In France, where our greatest investment had been made, liquidation has been completed. In England, stations have been turned over to British authorities and final arrangements for their disposition have not yet been consummated. In Italy, American aviation units occupied stations supplied by the Italian Government so no liquidation processes were necessary. In France a very large amount of supplies and equipment was sold to the Commission for the Relief of Belgium and was utilized for reconstruction and rehabilitation in the devastated regions of northern France and Belgium. A naval aviation unit, made up of volunteers, was supplied for erecting houses and handling stores under the direction of the Commission for the Relief of Belgium and this was the first and, for several months, the only organized unit working for the relief of the destitute inhabitants in the devastated regions. The American Red Cross and the United States Army also took over much material from the Navy at the time of demobilization. As a result of the liquidation proceedings many millions of dollars were saved and will revert to the Treasury of the United States.

Very shortly after the armistice about half the aviation personnel abroad was returned to the United States for demobilization. Of the remainder, retained abroad to assist in liquidating properties, a great number were formed into the nucleus crews for the manning of the German ships utilized for the returning of our troops.

Demobilization in the United States.—The demobilization of Navy personnel in the United States had reached an advanced stage by June 30, 1919, when all aviation officers who had not expressed the desire to remain on active service with the Regular Navy had been returned to inactive duty. The peace program prescribed for naval aviation calls for not more than six heavier-than-air patrol stations within the coastal limits of the United States. In order to comply with this requirement, all stations have been demobilized, with the following exceptions: Chatham, Rockaway, Cape May, Anacostia, Hampton Roads, Pensacola, Coco Solo, San Diego.

The Naval Aircraft Factory at Philadelphia is retained in operation, and a station for the erection and operation of rigids has been undertaken at Lakehurst, N. J.

Aviation to-day.—As a result of war activities naval aviation is now supplied with a Reserve Flying Corps, comprising approximately 3,500 officers and 9,600 men, of which 2,500 of the officers are qualified naval aviators and 1,000 officers are aviation technicians and administrators. The enlisted personnel of the reserve corps has been trained for aviation duties and as a class are believed to be as expert aircraft mechanics as the present state of the science can develop.

The material side of naval aviation has vastly progressed, and this branch of the service is now supplied with flying boats capable of long-distance patrols, carrying heavy armament and numerous personnel. The size of machines is constantly increasing, as is also their reliability and sea and air worthiness. The department has under consideration units of double the size of the NC type, which will have a vastly improved performance.

Relieved of the pressure of war, it has been possible since the signing of the armistice to give thought to the development of naval aviation as an adjunct to

fleet operations, and it is realized that the improvements in aircraft during the recent war have so increased their value for naval purposes that a nation which in time of peace does not develop a naval air service proportionate to its war needs, both in personnel and material, will be at a serious, perhaps a fatal, disadvantage in a war against an enemy who has made the expenditures and devoted the energy required for such development. Not only is the efficiency of our Air Service dependent upon the possession of such material and personnel but the efficiency of practically every type of naval craft is likewise affected. Aviation is an arm of the naval service without which the other arms of the Navy can not develop anywhere near their maximum of efficiency.

With this in view a fleet air detachment has been assigned to both the Atlantic and Pacific Fleets, consisting of twin-motored flying boats and kite balloons. These detachments have operated with the fleet with considerable success, in conjunction with the tenders operating with them. In addition, experimental work with planes carried upon the turrets of battleships are being conducted. The *Jupiter*, a collier, is being converted as a carrier for planes and will permit flying craft to be conveyed in considerable numbers with the fleet.

During the World War we were compelled to spend vast sums in developing our aviation. As already stated, we spent money freely in order to gain a position which would not only be abreast of that reached in the air by our hard pressed Allies, but would have secured for us a leading role had hostilities been continued.

To-day adequate aviation facilities for the purpose of continuing practical experiments in operations simulating those of war are necessities. It is the operator who supplied the vision which the mechanic makes practical. Without adequate facilities to operate under conditions simulating war, naval aviation can not advance.

No phase of naval warfare requires more practical experience than does aeronautics. Theories are of no value until tested by experience. Experience alone can develop satisfactory aircraft and the devices or arrangements necessary for handling planes on board ships. The strategical and the tactical employment of aircraft with ships are yet to be made entirely practical through practical application of theories.

We have done much during the war but there is much yet to be done. With the limitations imposed by and incidental to the sudden change from war to peace, it can be said that since the close of hostilities we have accomplished a very good start with the funds which Congress has deemed wise to allocate for the purposes of naval aviation. It is hoped that with the sums which are to be appropriated by this Congress further progress may be attained in creating an air service capable of operating effectively with the fleet on the high sea or in an overseas campaign.

Appropriations.

Fiscal years.	Departmental supervision.	Appropriation act.	Amount.
1912.....	Bureau of Navigation.....	Naval appropriation act.....	\$25,000
1913.....	do.....	do.....	10,000
1914.....	do.....	do.....	10,000
1915.....	do.....	do.....	10,000
1916.....	Chief of Naval Operations.....	Naval appropriation act (unobligated balances).	1,000,000
1917.....	do.....	Naval appropriation act.....	3,500,000
1917-18.....	do.....	do.....	5,133,000
1917-18.....	do.....	Emergency appropriation.....	3,000,000
1917-18.....	do.....	Urgent deficiency.....	11,000,000
1918.....	do.....	Naval appropriation act.....	45,000,000
1919.....	do.....	do.....	220,383,119
1920.....	do.....	do.....	25,000,000
			314,071,119

NOTE.—By act of February 25, 1919, \$97,000,000 aviation appropriations for the years 1917-18; 1918 and 1919 was withdrawn, and, therefore, that amount should be deducted from the total appropriated for those years, leaving a balance of \$217,071,119.

The unobligated balances from 1911 to December 31, 1919, at present amount to nearly \$8,500,000. There will probably be a considerable fund in addition that will be returned to the Treasury after liquidation proceedings are finished.

Up to 1916 the only appropriations for aviation were made to the Bureau of Navigation. Up to that time the various bureaus of the Navy Department expended money for aircraft just as money was expended for surface craft and naval units.

The strength of a fleet can no longer be measured alone by the number of battleships. Aircraft, light cruisers, destroyer leaders, destroyers, submarines, mine layers, and other auxiliaries are as necessary to the strength of the fleet as artillery, aircraft, tanks, chemical warfare service, and other auxiliaries are to the strength of an army. The battleships to-day are the infantry of the sea; battleships can no more fight alone than can the infantry on land.

It is believed that the aviation arm has now found its place as a permanent auxiliary to the fleet and has demonstrated to the older branches of the service its future possibilities as an indispensable adjunct.

WORK OF THE OFFICE OF NAVAL INTELLIGENCE.

Secretary DANIELS. The office of of Naval Intelligence performed a work of the utmost value not only during the war but in the years preceding it, gathering, through our naval attachés and other officers in Europe, all the information that could be obtained regarding war developments in Europe, those of Germany and Austria, as well as of the Allies, and continually furnished a mass of reports that give us information for use in developing our plans and policies. Its officers and agents, stationed at various points, were active in discovering and thwarting enemy activities, both in this country and abroad, and while we can not enter into details regarding specific cases, the following memorandum gives an excellent idea of the scope of its work, which was performed with notable energy and efficiency.

I would like to put that in the record. It is a very illuminating story of one of the most important services of the Navy during the war.

The CHAIRMAN. Very well.

(The memorandum referred to is here printed in full in the record, as follows:)

One of the first steps in the war activities of the Office of Naval Intelligence was the organization in every naval district of an intelligence service similar, in many respects, to the central organization. This was immediately begun and was created to promote and coordinate the work of the central organization. An aide for information was appointed to direct the work in each district and funds were apportioned to these aides. The importance of this may be realized when it is stated that at the outbreak of the European war a greater part of our foreign commerce was handled by persons who were not citizens of the United States.

It was well known in this country that the Germans had established a wonderful spy system through which Berlin was being informed of the activities in every branch of industry in this country. It is probable that there was not a manufacturing establishment here that did not have at least one paid agent of the German Government who kept that Government informed of everything that was going on. There is no doubt that even in the departments at Washington German agents were at work at all times. It was supposed that bases of some sort for the supplying of gasoline and supplies to German submarines were being secretly established at different points along the coast of Mexico, Central and South America. Before the United States entered the war Germans were allowed to enter this country freely.

The day the United States declared war the activities of the Office of Naval Intelligence were increased tremendously, for it became the duty of this office to not only continue its peace-time activities, but to form an investigation section to seek out the Germans who had been active in propaganda in favor of Germany, who were attempting to prevent by sabotage, by explosions, by fomenting strikes, and by many other means the manufacture of munitions of war; who were making bombs for the purpose of blowing up our ships and factories; and in general to prevent the activities of Germans and German sympathizers from continuing their nefarious pursuits.

This meant the expanding of the office in Washington tremendously, the reorganization of its personnel and extending its activities to every country of the globe, as well as covering every State of the Union.

The United States had, by direction of the Secretary of the Navy, been divided into 15 naval districts. Those districts covered the whole coast of the United States—the Atlantic, Pacific, Gulf, Great Lakes, in addition to Hawaii and the Canal Zone. The naval activities of each district were in charge of an officer known as the commandant. In each district there was an aid for information who acted at first directly under the Director of Naval Intelligence at Washington. Each district was further subdivided into sections in each of which was appointed a section aid for information who reported directly to the district aid for information. The activities of these aids, especially in our large ports of entry such as Boston, New York, Philadelphia, Baltimore, Norfolk, etc., were tremendous. The work handled by these district organizations was outlined by the central organization and included the following: First, subjects to be investigated by the aid for information:

(a) *Navy personnel*.—(1) Apprehension of deserters and stragglers; investigations and surveillance of enlisted men reported by the commanding officers of all United States ships; reported imposters appearing in the uniform of the Navy.

(2) Suspects attempting to enlist in the United States Navy, or United States Naval Reserve Force.

(3) Collusion between firms holding Navy contracts and enlisted men.

(4) Cooperation with other naval districts in the investigation of cases reported by them which fall within the field covered by the aid for information.

(b) *Navy-yard employees*.—(1) Investigation and surveillance of navy-yard suspects.

(2) Investigation of reported pro-Germanism of navy-yard employees.

(3) Thefts from the navy yard.

(4) Cases referred by commandant relating to the Naval Establishment.

(5) Investigation of alleged alien or enemy agitation connected with the navy yard.

(c) *Miscellaneous investigations*.—(1) All cases referred by the mail censorship bureau.

(2) Investigations of suspicious individuals reported in the vicinity of navy piers, wharves, docks, warehouses, etc.

(3) Investigation of applicants for pilot license.

(4) Investigation of cases involving radio and radio apparatus.

(5) Investigation of suspicious fires on piers, docks, and wharves under the Navy Department.

(6) Protection of shipyards within the naval district doing Navy work, and of naval vessels building or repairing within those shipyards.

(7) Protection of operation, product, and personnel of plants manufacturing munitions or other material for the Navy, other than those covered by the branch office of naval intelligence.

(8) Investigation of enemy agents and sympathizers and civilians concerning any activities inimical to the interests of the Navy.

(9) Investigation of addresses of such cables as may be referred to the aid for information by the cable censor.

In order to carry on these investigations a large number of men were enlisted whose qualifications showed them to be particularly fitted for this sort of work.

The investigation department of each aid for information was by no means the only work done by them, for an equally important job was the ship inspection. In order to keep out undesirable aliens a system of ship inspection was inaugurated in every port of entry in the United States by which the passengers and crew of each ship entering a port from a neutral country were lined up on deck, carefully inspected to determine whether their passports and papers were in due form and technically correct. The ship itself was examined from truck to keel to discover any unauthorized German literature to be used as propaganda or other contraband material that might be on board. This inspection was very strict indeed and it is believed resulted in preventing Germany from communicating with agents in this and other American countries. Every ship sailing from a neutral country was reported by our naval attaché abroad and any suspicious person aboard was also reported. Upon arriving in the United States such person was given a very rigid examination, and if anything suspicious was found on his person or among his baggage he was taken into custody by the Department of Justice and either deported or interned. This ship, passenger, and crew inspection work was conducted always in cooperation and in company with customs inspectors of each port of entry.

In addition to the inspection of incoming ships, a very important part of the duties of the aid for information was the inspection of outgoing ships to make sure that large amounts of material that could be used on German submarines were not being smuggled in the ship's stores or in other unauthorized places.

When leaving American ports neutral vessels were accustomed to carry an enormous quantity of spare machinery and electrical parts, many times more than was necessary. Up to this time these spare parts were usually taken on board in this country, but seldom entered on their manifests, and when the vessel returned to port they were found missing. In fact, many of these articles were unnecessary; for example, boiler tubes, condenser tubes, and boiler zincs went into Germany in large quantities by such channels.

Radio apparatus was frequently purchased by vessels while lying in port and installed on board in the guise of repairs. By this method large amounts of apparatus was taken on board and connected up to the existing apparatus in the radio room, and when the vessels returned the new apparatus was found to be missing.

Next to the supplies mentioned above, the most important article taken out in quantity was lubricating oil. Ships constantly left for a trip to Holland with enough oil to take them around the world, yet on their return they had barely enough to get into port.

The necessity of such inspection can be seen when the examination of the steamship *Ryndam* showed she had on board 750,000 pounds of copper in bars, strips, cakes, and wire; 250,000 pounds of brass in tubes, sheets, etc., and 1,700 barrels of lubricating oil and some 70,000 feet of aerial wire—silicon bronze; none of which articles appeared on the ship's manifest.

And officers for ship-inspection work were of vital importance, and as officers for these duties were not available, certain men were selected owing to their particular ability to carry out this work. These men were enlisted and commissioned.

It became possible to check up a number of these ship's stores through ship chandlers who cooperated with this organization, and as a result many masters of merchant vessels were fined for making fraudulent manifests. As a result of this it was determined to immediately start an investigation of the character and source of shipment and also investigations in regard to enemy goods in storage.

The Office of Naval Intelligence first made a list of all materials, covering agricultural or manufactured, in storage at the port of New York. It then became the business of the office to be informed as to all facts of a suspicious nature relating to firms, individuals, and companies doing business under contract with the Navy Department, as to firms whose business may be in contravention of the trading-with-the-enemy act; as to alien suspects and their activities; as to the apprehending of deserters and absconders; as to evidences of German propaganda; as to information relating to the enemy; enemy sympathizers; or suspected spies taking passage on vessels sailing to or from the United States; and as to suspicious ships and shipments.

Examination of the men employed on the docks as stevedores, etc., were infrequent, and in many instances they had never been made, with the result that the danger from alien enemies was almost at the maximum. Arrangements were made whereby all men employed on docks were required to have identification cards, and such means of identification were then demanded by all military guards placed upon the piers. By doing so a great source of danger was immediately eliminated.

It was arranged that after a vessel arrived at her pier there was a constant and actual Government control. In no instance was anyone allowed to leave or board the vessel before the search and muster were completed. This resulted in a continual custody from the moment of her arrival until the vessel departed, and the discharge of cargoes was accordingly, in reality, done under Government supervision. To obtain the greatest possible efficiency, specialization became necessary, and for that reason searches and musters on all vessels were made by bodies of men trained for that purpose. In several cases where special searches were necessary dock plans of the vessel were obtained from the surveyors' department.

All loose mail on incoming vessels was censored, and this included the large amounts of mail sent by consignees. In this manner there was closed an easy channel of communication between the enemy and its agents in this country.

The Navy Department also took charge of the development of camouflage work, which included the investigation of suggestions as to schemes of camou-

flage painting and the issuance of definite instructions as to the type of camouflage to be adopted, and arrangements were made with the Emergency Fleet Corporation of the Shipping Board for the practical application of camouflage to vessels not under the control of the Navy Department. To make the reports of camouflaged vessels more complete, photographs were taken showing the port and starboard view and a view of the forward side of the bridge of all vessels coming into the ports within the various districts, whether camouflaged or not. These photographs approached 5 by 7 inch size. The information collected by this division was turned over to the Bureau of Construction and Repair, which had charge of the developing of camouflage work in the Navy Department.

In May, 1918, the first German submarine appeared off of our coast. The aid for information of the fourth naval district was the first to report the attempted sinking of the American schooner *Edna*, which was found water-logged off Winter Quarter Light Ship on May 26, 1918, and towed into Philadelphia. Examination by the aid for information in person disclosed the presence on board of a detonating device, which was used in blowing a hole below the water line in order to sink her. She failed to sink, however, being loaded with case oil, which kept her on the surface of the water after becoming water-logged. From that time on section aids for information along our coast kept a very sharp lookout for submarines reported by wireless from ships at sea, which reports were made by telephone direct to the Office of Naval Intelligence. All submarines that came to this country were thus reported and their tracks on the high seas charted.

GENERAL INSPECTION OF PLANTS.

One of the principal activities of the branch offices of Naval Intelligence and of the aids for information in those districts where were no branch offices located was the inspection of plants having naval contracts. The first step taken by the Office of Naval Intelligence for the adequate protection of plants engaged in Navy work was the adoption and insertion in all Navy contracts of the following clause:

"In addition to the ordinary precautions heretofore adopted by the contractor for the guarding and protection of its plants and work, the contractor shall provide such additional watchmen and devices for the Navy Department against espionage, acts of war, and of enemy aliens as may be required by the Secretary of the Navy. The contractor shall, when required, report to the Secretary of the Navy the citizenship, country of birth, or alien status of any and all of his employees. When required by the Secretary of the Navy, he shall refuse to employ, or if already employed forthwith discharge from employment and exclude from his works, any person or persons designated by the Secretary of the Navy as undesirable for employment on work for the Navy Department."

A circular letter signed by the Secretary of the Navy was then sent to each contractor by the office, together with a set of printed questionnaire forms outlining information required by the office in pursuance of the above clause.

The forms were returned by the contractors in duplicate, each form describing the extent and nature of the plant's contracts with the Navy Department, containing a census of employees, from the standpoint of nationality, and describing in a general way the precautionary measures adopted by the company for the protection of its plant and the materials in process of manufacture for the Navy Department, together with a number of miscellaneous facts to enable the Office of Naval Intelligence to determine as promptly as possible the relative importance of the various plants.

Approximately 5,000 of these questionnaires were received from original contractors, their subsidiary and subcontractor plants.

The duplicates of these questionnaire forms were forwarded at once to branch offices and aids for information, with the request that they be carefully analyzed and that the plants be inspected in order of their importance.

Accordingly there are now on file in the Office of Naval Intelligence reports covering practically all of the plants that were engaged upon work for the Navy Department, giving detailed information under the following headings which will suggest the nature of the data compiled:

(a) *Official personnel*.—Which includes not only a list of firm's officers, but report of any investigations which have been deemed advisable as to their loyalty.

(b) *Contracts*.—Which includes a statement of the progress made on Navy contracts, a summary of companies' contracts with other departments of the Government, delays and the reasons therefor, etc.

(c) *Employees*.—Which includes a general statement as to the predominant nationality of employees, the method followed by the company in selecting employees, reports of investigations of suspicious individual, and detailed statements in regard to alien enemies employed, nature of employment, opportunities for sabotage, past records, etc.

(d) *Precautionary measures*.—Which describe the pass systems, the number and caliber of watchmen, barricades, use of flood lights, etc.

(e) *Fire precautions*.—Which includes a brief statement of the construction of buildings from a fire-protection standpoint and a brief description of the fire-fighting apparatus observed.

(f) *Labor*.—Which includes a brief statement of the companies' experience with its employees as regards to strikes, shutdowns, sabotage, and other disorders of serious nature, causes, persons involved, and likelihood of further disorders.

Thus the Plant Division of the Office of Naval Intelligence was in a position to keep and did keep the Secretary of the Navy and the bureau chiefs concerned informed of the progress; whether the proper and necessary lighting facilities were installed and maintained for the exterior lighting of plants at night; whether proper fencing was provided to completely surround the plant, and whether a proper and adequate system of identification of employees was established by means of passes and badges and, in fact, that every precaution was taken to prevent sabotage or injury to the plants by German sympathizers which would in any way reduce production.

Many of the plants having naval contracts were found to be poorly equipped for the prevention of fire, and many plants had little or no facilities for fighting a fire should one start.

This led the Office of Naval Intelligence to take the question of fire prevention up with the Treasury Department and the War Industries Board, which led, eventually, to the forming of the fire-prevention section of the War Industries Board, of which the Director of Naval Intelligence was a member of the advisory council. This fire-prevention section was furnished by the Office of Naval Intelligence with lists of plants with which the Navy Department had contracts involving more than \$100,000 and which, from the result by inspection of its agents, seemed to have little or no apparatus for the prevention or the fighting of fire. The fire-prevention committee immediately dispatched expert inspectors for a careful examination of these plants and, as a result of these inspections, made recommendations covering what was required to place them in a proper condition to prevent their destruction by fire. During the few months of its operation the fire-prevention section secured the installation of sprinkler systems, construction of fire walls, and introduced better methods of housekeeping in hundreds of plants which the Navy depended upon for its vital needs during the war.

In general, the Plant Section of the Office of Naval Intelligence confined their recommendations to physical improvements in the plants and to the enforcement of law regarding employment of alien enemies, together with the investigation of prospective employees. In the vast majority of plants engaged upon Navy work, very extensive and needful improvements were made, involving, in the aggregate, hundreds of thousands of dollars, which expense, with a single exception, was met by the contractors themselves. It is further believed that the frank discussion of these subjects between the contractors and representatives of the Office of Naval Intelligence resulted in awakening the minds of the contractors to a more thorough appreciation of the necessity of taking extensive precautions for the protection of their plants and in the selection of employees. Very loose methods had been the rule in the majority of plants prior to these improvements. As an example, in one plant alone over 90 alien enemies were removed and turned over to the Department of Justice for such disposition as it saw fit. Many of the other plants had alien enemies removed and interned for the duration of the war. It is only fair to the contractors to state that they cooperated most cordially with the representatives of the Office of Naval Intelligence and were willing and anxious to place their plants in a condition which prevented sabotage and destruction by bombs and fire. This resulted in very few explosions and very little damage being done by fire or sabotage in any of the plants having Navy contracts, all of which were under the watchful eye of representatives of the Office of Naval Intelligence.

Shortly after Mr. John Lord O'Brian, of Buffalo, was appointed by the Attorney General as special assistant in his office to handle all cases arising as the result directly of the war, weekly meetings were held every Wednesday in his office in the Department of Justice. At these conferences were the Director of Military Intelligence, Director of Naval Intelligence, a representative of the Department of Labor, a representative of the State Department, and the officer in charge of the Bureau of Investigations, Department of Justice. At these conferences all matters pertaining to the activities of alien enemies, passport regulations, labor troubles caused by aliens, etc., were discussed. The passport regulations were so changed by a proclamation of the President that the consuls in all foreign ports, before viséing the passports of persons desiring to sail for the United States were required to submit the names of such persons to the naval and military attachés in the country from which they were about to sail. In case the naval attaché considered a person distinctly undesirable he would inform the consul at the port of embarkation, who refused to visé the passport. In this way hundreds of undesirable men and women were prevented from reaching the United States, and without question Germany was cut off from communicating with her agents in this country by means of a messenger service. If, by chance, an undesirable person obtained a visé, and such fact became known to the naval attaché, he was instructed to cable the Office of Naval Intelligence a description of the person, the steamer upon which he sailed, the port of destination, and what he knew concerning him. The Office of Naval Intelligence transmitted this information, with what additional information it had in its files concerning this person, to the aide for information in the district in which the port of arrival was located and upon his arrival this particular passenger was given a searching overhauling, which resulted frequently in his being refused admittance, or, if admitted, he was interned for the duration of the war.

It can readily be seen, therefore, that it was with difficulty Germany was able to communicate by messenger with any of her loyal citizens in the United States.

As an additional precaution, as soon as ships from European neutral countries arrived in our ports a naval port guard was placed aboard and remained on board to prevent the landing and desertion of the crew. It was the duty of this guard to search every person who came aboard and who went ashore, to have a certain supervision over the cargo, and to generally look out for the safety of the ship.

A similar examination of the crews was made of every vessel departing to foreign ports to prevent smuggling of letters, etc. It can be said as a result of these precautions that smuggling and letter carrying was reduced to a minimum. It has been stated that the price of a smuggled letter rose from \$5 per letter at the time of our entry into the war to \$100 per letter at the close of the war, with a few takers at the latter figure. All work in connection with passenger and crew control was rendered possible only by the hearty and cordial cooperation with the Department of State. The names of applicants for all United States passports, both resident in the United States and in foreign countries, were submitted to the State Department, who in turn submitted them to the Office of Naval Intelligence, Military Intelligence, Department of Justice, and, in special trade matters, to the War Trade Intelligence Bureau. The total number of names passed through the Office of Naval Intelligence files was approximately 1,000 a day. The Office of Naval Intelligence kept the State Department informed of undesirable applicants for passports, visées, or alien permits, whose names were furnished to it by domestic agents or by naval attachés.

All information collected by the Office of Naval Intelligence in "trading with the enemy" was disseminated to the War Trade Board, Department of Commerce; and in some cases to the Military Intelligence Division and to the Department of State. This information was largely obtained from the naval attachés, notably in Argentina, Brazil, Holland, and Scandinavia. In some cases foreign firms suspected of trading with the enemy and having branches in the United States were investigated at the request of the War Trade Board. These investigations were ably conducted by the branch offices, particularly the office in New York. Intimate relations were established by the Office of Naval Intelligence with the Bureau of War Trade Intelligence, which thoroughly cooperated with the Navy in holding up undesirable exports and imports and exercising their power wherever power of the Navy Department was lacking. The Office of Naval Intelligence received weekly from the War Trade Board 100 copies of supplements to the Enemy Trading List, together with additions and changes to the list, and rules and regulations of the War Trade Board. These were

distributed to all the branch offices of Naval Intelligence and to all the naval attachés abroad.

Before our entry into the war the Office of Naval Intelligence was confined to collecting information from abroad, principally concerning the material of foreign navies, changes in ship design, the expansion of foreign navies, and the advances made in the designs of new ships, etc. This information was received, filed, and placed at the disposal of any officer who desired to look up the technical questions concerning foreign ships. As soon as the war was declared in April, 1917, a section of the Office of Naval Intelligence was instructed to compile this information and to disseminate it not only to bureaus of the Navy Department, which were particularly interested, but to all our forces afloat, at home, and abroad. These reports soon increased in number so that it became necessary to mimeograph the compilations made from them, and to distribute them to the fleet and others concerned. First, we got out a mimeograph compilation once a month; then twice a month, and later these got so bulky that it was necessary to print them; and by the end of the war the mailing list contained 450 names.

In addition to this semimonthly compilation (which was confidential), other reports were printed which were of a more secret nature, and were disseminated to a very limited number of officers. In this way commander in chiefs, force commanders, and division commanders were kept informed at all times of the activity of the fleets of the allied powers; of the enemy fleet; of the ships sunk, and of their total tonnage; with the number of enemy submarines in the Atlantic and the Mediterranean; with the tracks they had made, and, in general, all efforts made by the allied and associate powers to end the war. Not only were the naval activities reported on, but many reports covering the activities of the armies in the field on all fronts were printed and disseminated. The section of the Office of Naval Intelligence, which got out these compilations, deserves the greatest possible credit for keeping the Navy at large—ashore and afloat—in close touch with the operations of the fleets of all the combatants.

When the armistice came there were 306 reservists in the Office of Naval Intelligence additional to the 18 civil-service clerks and messengers serving at the beginning of the war, or a total of 324. This force will be reduced on July 1, 1920, to 18 of the statutory roll and 24 former reservists, or a total of 42.

The above-named activities of the Office of Naval Intelligence are those which were added as war activities, and which had previously not been recognized as being legitimate functions of that office.

The Office of Naval Intelligence was created in March, 1882, for the purpose of collecting information from abroad concerning the navies of other countries, and more especially for the collection of technical information in improving the design of ships of our own Navy. The information thus collected, therefore, concerned principally the personnel and material of foreign navies, changes in ship design, building programs, war resources, means of communications, port facilities, foreign merchant marine, data as to our own merchant ships in relation to fitness for war purposes, trade routes, and geographical information of importance in war. This information, received through naval attachés and other sources, is filed and placed at the disposal of Government officials who desire information on technical questions regarding foreign navies. In addition to furnishing information on file in compliance with numerous demands created by the war, the Office of Naval Intelligence, as a war measure, got out a mimeograph compilation once a month for general dissemination of technical information of interest on account of the war.

It was soon found necessary to get this publication out twice a month, and in addition to this semimonthly compilation, which was confidential, other reports were printed, of a more secret nature, and disseminated to commanders in chief, force commanders and division commanders, concerning the activities of fleets of the allied powers; of enemy ships; of merchant tonnage sunk; numbers of enemy submarines; with tracks they had made from latest reports; and in general, the progress of allied naval operations against the enemy. In other words, the peace-time activities of the Office of Naval Intelligence were expanded into the widest and most effective dissemination of war intelligence possible.

It is interesting to note that the naval appropriation bill for next year restricts the activities of the Office of Naval Intelligence in the matter of collecting information at home, and places the office on its original footing prior to the war.

Secretary DANIELS. Mr. Chairman, I will bring this up this afternoon, but just at this place I would like to have in the record a very brief statement of the splendid service rendered at the Azores. Admiral Dunn was in charge there, and in the early part of the war, as you remember, the Azores gave the Allies very great trouble. If it had been selected or obtained by the Germans as a naval base, they could have used it as a base from which to create great havoc in American shipping and American troop transports, and one of the things we were most earnest about was securing the Azores as a base for America, and I wish to put in the record a brief statement as to the service there. I will bring it to you this afternoon, and I would like to have it appear here, so as to be in sequence.

The CHAIRMAN. At this point in the record?

Secretary DANIELS. Yes.

The CHAIRMAN. Very well.

Secretary DANIELS. I would like to bring it up this afternoon and have it put in at this point. It is more fitting that it should be here.

(The matter submitted by Secretary Daniels in regard to the Azores is here printed in full in the record as follows:)

IMPORTANT BASE ESTABLISHED IN THE AZORES, UNDER COMMAND OF
ADMIRAL DUNN.

The Azores, the "half-way stopping place between Europe and America," was one of the most vital points, strategically, between this country and Europe. Had the Germans succeeded in establishing a U-boat base there, or in utilizing those islands for supplying or refueling submarines, they could have seriously menaced our troop and cargo transportation and trans-Atlantic lines of communication. There was serious fear that they might do this, as is indicated by Admiral Sims's dispatch of July 13 and his letter of July 30, 1917, in which he informed us that England had sent a mystery ship and two submarines to the Azores, and it was hoped that the United States would do the same, and said: "The advisability of the United States sending one of the older battleships with perhaps two or three auxiliary craft to the Azores to prevent the use of these islands as a base during the coming winter should be considered." That these fears were well grounded is shown by the fact, stated by Admiral Sims in his testimony, that the Germans sent out the big submarine *Deutschland* and "this ship began her cruise in the summer of 1917 in the vicinity of the Azores"; that other U-boats were operating there and that the town of Ponta Delgada was bombarded by a submarine on July 4, 1917. This U-boat was driven off by the fire of the U. S. S. *Orion*, which happened to be in port at the time.

Yet, though he himself suggested sending certain vessels there, Admiral Sims now cites the dispatch of the few ships we did send, temporarily to scout around the islands in search of U-boats and possible submarine bases, as an instance of diversion of forces from the critical area. As a matter of fact, it was important to prevent any possibility that the Germans might use the Azores as a base, or refuel and supply their submarines there. Furthermore, it was necessary to drive away any submarines that might be in that vicinity or in the islands anywhere nearby, from which they might attack merchant or supply ships, or naval craft.

By consent and with the cooperation of the Portuguese Government we later established a United States naval base at Ponta Delgada, which proved of the greatest value, especially for our submarine chasers and other small craft sent to Europe, which could there refuel, secure provisions, and have repairs made, as we established a repair station and maintained a repair ship. Our forces there rescued and towed to port a number of merchant vessels which broke down in the vicinity, some being towed into port from considerable distances.

There is no question whatever as to the wisdom of establishing a base at Azores, and sending or maintaining forces there. I wish to pay tribute to the excellent work performed by Admiral Dunn, the able and energetic officer who was in command of this base and whose services were of the utmost value. His duties were ably and conscientiously performed, and had no small part in our success in sending safely across the Atlantic the large number of submarine chasers and other small craft which were dispatched to Europe.

I submit a brief memorandum from Admiral Dunn regarding our work in the Azores:

(The memorandum referred to is here printed in the record as follows:)

MEMORANDUM FOR THE SECRETARY OF THE NAVY CONCERNING THE ADVANCE BASE AT THE AZORES UNDER COMMAND OF REAR ADMIRAL H. O. DUNN.

In the latter part of November, 1917, I was detached from the command of the Fifth Division, Atlantic Fleet, and ordered to Washington, temporary duty, at Operations, to prepare an expedition to establish an advance base at Ponta Delgada, Azores.

After considerable delay owing to settling the diplomatic questions involved and preparing the material and personnel for the expedition, I embarked on the U. S. S. *Hancock* with a complete advance base outfit including a detachment of Marines with aviation outfit, two 7-inch guns, to be mounted at Ponta Delgada, to defend the harbor, wire net to protect the entrance of the harbor against torpedoes and a complete number of officers to establish headquarters. The expedition, accompanied by two destroyers, arrived in the Azores on January 19, 1918, and immediately set to work to establish a base.

The occupation of the Azores, in my mind, was of great strategic value from the mere fact that had it been in possession of the enemy it would have formed an ideal base for submarines, and as our convoy routes passed both north and south of the islands an enemy base would have been a very serious obstacle for the successful transport across the ocean of troops and supplies.

The base proved of great value in regard to the passage across the ocean of all our small vessels. All the convoys of the 110 footers and the tugs and small vessels were obliged to stop at the Azores for fuel, provisions, and generally all were in need of repairs.

To this end I had established a repair station and used a repair ship, which was of great value in carrying on the work of assistance both to the naval vessels and the merchant marine.

It constantly happened, during the stormy winter weather, that merchant vessels would break down in the vicinity of the islands, and I would send out sea tugs to tow them in and repair them and send them on their way. In several instances the merchant vessels were rescued at distances of 400 to 500 miles from the islands.

I had at my disposal several of the K submarines, which operated as well as possible under the conditions, but they were, of course, constantly in need of repairs, as their type was not equal to the possible enemies they might encounter. They required a great deal of attention and overhauling to keep them going, but they did as well as could be expected under the circumstances.

A part of the time I had a few destroyers, but as they were needed in European waters I could not keep them long enough to be of any advantage in patrolling the war zone around the islands.

The aeroplanes were old type and of little use, as their limit of flight was two hours, and they had no means of communication from the aeroplane to the shore.

The relations with the Portuguese authorities were very cordial, a high commissioner, who was a general in the Portuguese Army, was sent to the islands to represent his Government and settle all questions which came up without reference to the Lisbon Government. This high commissioner, Gen. Machado, was of very great assistance to me and was loyal in his devotion to the cause, and I held him in very high esteem.

In addition a hospital was established ashore, which was of great value to the personnel, both stationary and those that passed through the island. During the epidemic the islands suffered greatly from the influenza, and we were in a position to lend great assistance to the natives at that time, for which they were profoundly grateful.

In the latter part of my stay at the islands I had the use of two mine planters, which were used both for dragging for mines and for heavy sea work in rescuing vessels.

On the 4th of July, 1917, the town of Ponta Delgada was shelled by a German submarine, and it created great consternation on the island. Fortunately, at the time, one of our colliers was in the harbor having its rudder repaired, and the stern of the ship, which mounted a gun, was elevated so as to be above the breakwater. This ship, the *Orion*, opened fire on the German U-boat and drove her away. It is a curious fact that on the anniversary of this date, July 4, 1918, all the people in the island were very much disturbed, as they expected another attack on the same day.

During my occupation of the base, from January 19, 1918, to April 19, 1919, no enemy submarine appeared off the island, although several operated in the war zone around the islands and sank some shipping. No contact was made by our force with enemy U-boats.

H. O. DUNN,
Rear Admiral, United States Navy.

INCREASE IN PERSONNEL—THE WONDERFUL EXPANSION AND TRAINING OF THE AMERICAN NAVY HAS NO PARALLEL IN ANY NAVY IN ANY WAY.

Secretary DANIELS. Mr. Chairman and gentlemen, what the Navy did in enlisting and enrolling and training young men for the naval service during the World War has had no parallel in any navy either in the last or any previous war. This monumental service would have been impossible without the act signed by the President on August 29, 1916, which made provision for an increase of the enlisted personnel from 57,000 to 97,000 including all classes in a possible emergency. It would have been impossible also but for the action of the President declaring an "emergency" on March 24, 1917, and for the passage of the Naval Reserve act in 1914 as amended and enlarged by the act of August 29, 1916. This legislation recommended by the Secretary of the Navy and enacted by a Congress, which made the best provision for the Navy in all the history of the Republic, gave opportunity and authority before war was declared for the Navy to expand its personnel until when the armistice was signed the Navy contained 217,276 Regulars and 271,571 Reserve enlisted men, total 488,847 men and 10,489 regular officers and 20,705 Reserve officers, total 31,194 officers; total officers and men 520,041. The British Navy, much larger than ours, in fighting ships, and engaged longer in the war, was on November 11, 1918, composed of 36,243 officers and 378,919 men, total 415,162 or 100,000 less than in the American Navy.

There never was a minute from April 6, 1917, to November 11, 1918, when a ship was ready to sail that the officers and men were not ready to man the ship, and this was true not only of fighting naval

craft but also of hundreds of ships carrying troops and supplies and merchant ships, a service which nobody supposed the Navy would be called upon to perform. It is equally true that the necessity of furnishing 19,652 men as armed guards on merchant ships had not been foreseen, and yet that extra dangerous services, begun before we entered the war, was performed by naval personnel in a way that testified to the resources of the Navy to meet any demand made upon it.

Not less to its credit of attracting hundreds of thousands of splendid young men to the Navy was the expedition and efficiency with which they were trained. This was largely due to their own zeal and willingness and capacity, but the chief credit is due to the wise and well considered policies formulated by the Navy Department and the initiative and versatility of the officers and men charged with the duty of rapidly converting civilian youth into capable seamen and officers. Their training on ships, at stations, and in schools enabled bright and enterprising youths to qualify as officers in a time so short as to surprise the oldest officers in the Navy. Sir Eric Geddes, First Lord of the British Admiralty (a position which corresponds to that of Secretary of the Navy of the United States) was deeply impressed with the training of these young men, and upon a visit to America during the war, said:

The dauntless determination which the United States has displayed in creating a large body of seamen out of landsmen is one of the most striking accomplishments of the war. Had it not been effectively done one would have thought it impossible, and words fail me to express our admiration of this feat undertaken and accomplished by your Navy Department of which Mr. Daniels is the civic chief.

There was not a moment from the time war was declared when the Navy did not have a rush of young men to enlist in the regular Navy or to enroll in the reserves. The problem was one of training, and recruiting stations were thronged with patriotic youths. They came in as a matter of fact more rapidly than they were needed, and the old battleships and all available barracks were utilized for their training, and new barracks were rapidly provided and new ships chartered to furnish facilities for training the new recruits. By the time of the armistice there were over 500,000, of which more than half were on shore duty or under training when the war came to a close.

In view of this big enlistment it is interesting to look back to see what were the expectations of naval officers of the number of men that would be needed in case of war. In 1914 it was proposed by some officers to change the general policy of the Navy. It had long been the practice to keep only the latest ships in commission, the others in reserve, and the oldest ones in ordinary with a skeleton crew. In 1914, within 13 months after coming into office, for the first time in years I had, by offering a chance for education and promotion, secured the full enlistment authorized by law. The highest suggestion of increase then was 20,000 additional, which in the light of increase from 57,000 to 523,000 now seems a very small increase. On May 17, 1916, the General Board stated that in case of war "the total number for which provision is to be made at present, for war in the Atlantic, is 100,000."

That was the conception of the General Board on May 17, 1916, in case of war in the Atlantic, 100,000 men. We actually had 500,000

men; in other words, five times as many as that great body of naval statesmen supposed we would need.

In August, 1916, I recommended, and Congress granted, 97,000, or just 3,000 less than the 100,000 desired by the General Board. In July, 1915, the General Board had recommended an increase of 11,000 men—that was in July, 1915, bear in mind—and that the ships in reserve should have 50 per cent of the complement instead of smaller percentage, often only 25 per cent, which had prevailed in previous years. Nobody in the Navy in 1915, or 1916, dreamed that in any war so many as 500,000 men would be needed. They thought then in terms of the character of service which it was supposed the Navy would be called upon to render, and not in terms of the larger and more varied duties which the Navy was called upon in the World War to undertake.

It is interesting to contrast the more than half a million men in the World War with the number who had served in the previous wars, as contained in the following statement from the Chief of the Bureau of Navigation. [Reading:]

PERSONNEL OF NAVY IN ALL WARS.

Following are tables submitted in accordance with your letter of to-day, giving the total number of enlisted men in the Navy during the several wars, and the total number of men who have served in the Navy since the organization of the Navy Department.

Enlisted men serving during war periods in United States Navy:

War of 1812.....	20,000
Mexican War.....	7,500
Civil War.....	121,000
Spanish-American War.....	23,000
World War.....	551,736

Total men having naval service since organization of Navy Department:

During War of 1812.....	20,000
During Mexican War.....	7,500
Estimated men having naval but no war service before 1885.....	200,000
During Civil War.....	121,000
Since January 1, 1885.....	850,801

Total..... 1,199,301

There are no individual records before January 1, 1885.

Those inclined to be critical of the number of men in the Navy before the war should read the statement of Admiral Plunkett before the committee when he said:

I might say right now for the benefit of Senator Trammell that no officer in my recollection—

I wish to emphasize this—

no officer in my recollection ever dreamed or ever thought of having a personnel sufficient to man everything carried on the Navy list and have it ready for battle at the outbreak of the war. All we figured on was that the ships which were turned over to us to operate, and which we called our fleet, should be fully manned and should be ready for war, that is all.

When war came the Navy Department had all "the ships turned over to operate, which was called our fleet," fully manned, and as needed we furnished 20,000 men for the armed guard, 22,000 men for the troop transport service, cargoes, and men enough to man every other ship put in commission and all other naval activities and sent

nearly 50,000 for shore duty across the seas, most of whom were in the aviation, a number much larger than most forward-looking men in the Navy had ever contemplated.

In the summer of 1916 definite war plans were provided by the General Board to guide our action in the event of war with Germany. In addition to the five-year building program of 156 fighting ships, proposed in compliance with the letter of the Secretary of the Navy, for a large and continuous program, to the General Board on July 30, 1915, answering an oral order of the Secretary to express its opinion on personnel needed, the General Board made this report:

The General Board recommends that legislation be sought for the fiscal year 1917 which will authorize an active personnel, officers and enlisted force, capable of:

(a) Keeping in full commission all battleships under 15 years of age from date of authorization, all destroyers and submarines under 12 years from date of authorization, half of the cruisers, all gunboats, and all necessary auxiliaries that go with the active fleet.

(b) Providing partial complements for all other ships in the Navy that would be placed in active use in time of war.

(c) Providing the necessary personnel for training and for shore stations.

The partial crews mentioned under (b) should be 50 per cent of the full war complement for battleships, cruisers, destroyers, and submarines. They should be permanent in order that they may be kept thoroughly trained and the ships maintained as efficient units of the fleet, ready for immediate service in case of an emergency by simply filling the complements. For other ships the partial crews should be adequate for their upkeep.

This does not provide sufficient personnel for war. With full complements for all ships of the Navy ready for service in 1917 and a minimum number required at shore stations, 74,700 men will be needed. In addition, upon the outbreak of war the personnel of the Navy must be greatly expanded to provide for aviation coast defense districts, patrol craft, and other auxiliary duties of every sort, as well as for a reserve of men under training to replace casualties. The Coast Guard, Naval Militia, and Naval Reserve will be far from sufficient to meet these demands. The Navy is the first line of defense to the country. For peace requirements in the fiscal year 1917 the general board regards as inadequate any smaller force than 67,000 men in the Regular Navy.

Following the recommendations of the general board in the fall of 1915 I asked Congress for an increase in the enlisted strength of the Navy, and in June, 1916, when it was certain that the great three-year program of 156 ships, to cost \$500,000,000, would find favor with Congress, I addressed the following letter to the chairman of the United States Senate Naval Affairs Committee:

MY DEAR MR. CHAIRMAN: Owing to the immediate and unexpected need for enlisted men to keep in commission and to place in commission ships which are ordinarily kept in reserve with reduced crews, and to fully man all such ships, I recommend that there be incorporated in the pending naval appropriation bill a provision establishing the enlisted strength of the Navy as 74,700 men—

Recalling the facts, Mr. Chairman, that the joint board recommended 67,000—

and authorizing the President to increase the number to 87,000 when in his judgment it may become necessary to place the country in a complete state of preparedness.

The increase to 74,700 from the 54,000 now enlisted is the number recommended by the general board as being required to fully man all ships ready for service in 1917 with a minimum number at the shore stations. It has been the policy for many years to keep a large number of ships in ordinary or in reserve with reduced crews. Formerly the number of men assigned to ships in reserve was 25 to 33½ per cent. Last year I increased the number to 40 per cent. In its last annual report the general board recommended that it

be increased to 50 per cent. If the recommendation is acted upon, as soon as the number authorized is enlisted, it will be possible to keep these ships fully commissioned. Later, when there are no pressing exigencies, the older ships could be reduced to a 50 per cent crew if advisable, and the new ones coming in could be fully commissioned. The large number of enlisted men who would come into the service would, when their term of enlistment expires, constitute an ideal addition to our reserves—a need long felt but never yet provided. In my report of last December—

I beg you to bear this in mind—

I stated that in addition to the number of enlisted men asked for at the time, it would be necessary to further increase the enlistment at the next session of Congress. In view of the present necessity for keeping all ships in active duty, not then foreseen, I am asking that the increase contemplated for next year be authorized in the pending bill, and therefore recommend the additions set forth in this letter.

In addition—

And asking for this number of men, 87,000, which with the necessary additions for the Hospital Corps and other men made it 97,000—

In addition, upon the outbreak of war the Navy would be greatly expanded, and more men would be required for aviation, naval coast defense, patrol craft, and other auxiliary duties of various kinds, as well as to provide for men under training to replace casualties.

Very respectfully,

JOSEPHUS DANIELS,
Secretary of the Navy.

HON. B. R. TILLMAN,
*Chairman Committee on Naval Affairs,
United States Senate, Washington, D. C.*

On date of July 25, 1916, following my letter of June 20, asking for the increase to 87,000 plus 6,000 apprentices and 4,000 in the Hospital Corps, I addressed a letter to the Chairman of the Senate Naval Affairs Committee in regard to increasing the enlisted strength of the Navy, showing how the increase was to be distributed to make the Navy more efficient, in order to carry out the policies recommended by the General Board. In that letter I said:

It is the intention of the Navy Department to fully man all naval ships which are ordinarily kept in reserve, or ordinary, with reduced crews, and to provide trained crews for the new vessels under construction and which will be commissioned between now and the latter part of 1917.

The present strength of the enlisted personnel of the Navy is approximately 54,000, and the number recommended by the General Board is 74,000, which figure includes men and apprentices under training. This increase of 20,700 and approximately 2,600 Hospital Corpsmen (which will be computed extra to the regular complement in case the Senate's bill becomes a law), a total increase of 23,000, will be applied as follows:

(a) This increase of 23,000 men was to be applied as follows: For ships in reserve or out of commission, 16,000 men.

(b) For vessels under construction, 4,300 men.

(c) Training stations, trade schools, navy yards, hospitals, special duty, etc., 2,000 men.

Congress was favorable to the recommendations contained in the above letter, voted the increase, and thereby enabled the Navy when war came to have ample authority to increase the regular Navy to the 87,000 men named in the bill. As a matter of fact, this 87,000 men was not the actual number authorized, for under general legislation we could also enlist in addition 6,000 apprentices, which made a total of 93,000, and in addition to the number, Congress allowed a

Hospital Corps of 3½ per cent of the total strength of the Navy and Marine Corps. This gave an addition of 4,000 men, bringing the grand total of enlisted men in the Regular Navy, authorized by the act of 1916, in case of emergency, up to 97,000 men.

Illustrations of the fact that the Bureau of Navigation as late as October, 1916, believed that the number of men deemed necessary in 1921—now, bear that in mind—as an illustration of the fact that the Bureau of Navigation as late as October, 1916, believed that the number of men deemed necessary in 1921 was to be only 93,957, with an increase of 5 to 10 per cent recruiting and training, I append the official statement made to the Secretary of the Navy by the chief of the Bureau of Navigation at that time.

Personnel.—Report of the Chief of the Bureau of Navigation (Rear Admiral L. C. Palmer), October 10, 1916:

From: Chief of Bureau of Navigation.

To: The Secretary of the Navy.

Subject: Annual report for fiscal year 1916, with additions to October 1, 1916.

Appreciation of the immediate needs of the service has been shown to be nationwide, and in the recent naval appropriation bill Congress carried out the wishes of the people by enacting legislation of far-reaching importance.

The most far-reaching and important of any legislation ever enacted in our country or in any country, for that matter.

This includes a provision for an immediate authorized enlisted strength of 68,700 men and 6,000 apprentice seamen, a total of 74,700. Preparation for the future was not neglected, and the same bill authorized the President, in emergency, to increase the authorized enlisted strength to 87,000. It is evident that Congress considered the present needs of the naval service in deciding on this number at this time, as the usual additional allowance of apprentice seamen, 6,000, would provide for an actual enlisted strength of the Regular Navy of 93,000.

It is interesting to note that the above figure closely approximates the bureau's preliminary estimate of 93,957, which provides for the number of enlisted men (including average sick allowance) necessary to fill the billets in 1921—

Four or five years ahead—

the year of completion of almost all of the present program. From 5 to 10 per cent should be added to this for increased complements and working surplus, and the authorized enlisted strength should be increased to this number in time for the necessary recruiting and training.

In addition, Congress considered it necessary to have a large number of reserves at comparatively small expense during peace time, and provided the machinery for enrolling and instructing this force. Its value can not be overestimated, as there are thousands of important billets on reserve ships, on merchant vessels to be taken over, and in connection with naval activities afloat and ashore, which require additional trained personnel in war time.

This letter is exactly correct, except that it should have added "That Congress should amend the bill passed in 1914 in such a way as the Secretary had pointed out for securing more reserves, because this began in the year 1914—the whole reserve system."

The CHAIRMAN. How was that pointed out?

Secretary DANIELS. To the Naval Affairs Committee.

The CHAIRMAN. Does that appear in the record of the Naval Affairs Committee?

Secretary DANIELS. Oh, yes; in the hearings of the Naval Affairs Committee. They will show all that I recommended; a reserve—

The CHAIRMAN. In the hearings of the Naval Affairs Committee of what date?

Secretary DANIELS. I mean the Naval Affairs Committee of the House. I will get the date. Further on you will see, Mr. Chairman, that I have that very well set out here.

The preliminary estimate for 1921 for enlisted reserves of all classes, including retired personnel and a considerable force of naval militia, is 43,978, and steps have been taken to enroll this force.

The preliminary estimate for 1921 was only 41,000 men. As a matter of fact, we had enrolled 200,000 men in 1917 and 1918.

As has been shown Congress authorized on August 29, 1916, the Navy to enlist 73,000 men, and I fully expected when the bill became a law that by the end of 1916 the Bureau of Navigation would have enlisted the full quota. As a matter of fact, the number of enlistments of regulars was so small that the net gain per month was disappointing. And this was in a month, August, 1915, when Admiral Palmer was Chief of the Bureau of Navigation.

The net gains were as follows in the fall of 1916: 188 in September, 571 in October, 853 in November, and 1,017 in December. The number of enlistments for the months are shown in the following table:

Enlisted personnel.

Month.	Number of enlistments.	Total loss.	Net increase.
1916.			
September.....	1,793	1,605	188
October.....	2,192	1,621	571
November.....	2,257	1,404	853
December.....	2,572	1,555	1,017
1917.			
January.....	3,512	1,299	2,212

We therefore had a shortage of 20,000 men in the regular service out of the 73,000 authorized in August, 1916, enlisted when the new year of 1917 dawned. This lack of regulars was disappointing and shows that it was not until later that the young men were ready to enlist in the Navy in large numbers. The department kept recruiting stations open, offered advantages of education and chances of promotion as it had done in 1914, when the quota was filled for the first time in several years. The lack of success by the Bureau of Navigation, charged with recruiting, was doubtless due to the demand in factories, which were all running on full time, where men were paid so well that until war was imminent they did not respond to an appeal to enlist in the Navy. Writing in my annual report made December 1, 1916, of the increase in the personnel since I became Secretary of the Navy in 1913 and of the difficulty of securing rapid enlistments after the passage of the act of August, 1916, I said (see p. 46, Annual Report):

On the 5th of March, 1913, the enlisted personnel of the Navy was 4,153 short of the authorized complement of 51,500. After careful study the problem was solved of why young Americans did not fill up the quota. An opportunity for education and opening new doors for promotion attracted young men who had not enlisted until these new advantages of service in the Navy were afforded them. The youth of the country responded to these increased opportunities in the Navy, and during the past three years the complement has

been several times in excess and a waiting list created, while the number of recruits enlisted in this time reached a total of 6,831.

The department was gratified over the response of the young men of America to the inducements to a Navy career. The department, however, is not blinded to the fact that the total authorized increases in the complement since the passage of the new bill, amounting to over 26,000 men in the Navy and 5,034 men in the Marine Corps, impose a difficult and exacting recruiting task. The difficulties are accentuated by the unprecedented demand for labor throughout the country, particularly in the industrial centers, together with the increasing activities of other recruiting services. Since the passage of the act of August 29, 2,524 new men have been enlisted, for a part of the time the inflow averaging about 1,000 men a month.

In order to obtain the large increase, the Navy recruiting service has been extended to reach every section of the United States.

Though the naval recruiting service had been extended to reach every portion of the United States, on April 1, 1917, a few days before war was declared, we had only 62,607 men of the regular authorized number of 74,700. We therefore, Mr. Chairman, had a shortage of 20,000 men in the regular service. I beg you to bear this in mind. We had only 62,607 men of the regular authorized number of 74,700. The President, on March 24, 1917, had issued his Executive order, which authorized a total number (including all classes in the regular Navy) of 97,000—or, to be exact, 96,982.

In his testimony before the committee, Capt. Palmer, who became Chief of the Bureau of Navigation after the act of August 29, 1916, had passed Congress, said that the President signed the Executive order increasing the number to 87,000 plus apprentices and Hospital Corps, May 6, 1917. His memory served him false in this as in several other instances. Now, bear in mind, he said the President signed this order May 6, 1917. His memory served him false in this as in several other instances. Here is the Executive order of the President directing the emergency increase of men both in the Regular Navy and in the Marine Corps:

EXECUTIVE ORDER.

By virtue of the authority vested in the President by the act approved August 29, 1916, entitled "An act making appropriations for the naval service for the fiscal year ending June 30, 1917, and for other purposes," it is hereby directed that the authorized enlisted strength of the Navy be increased to 87,000 men.

WOODROW WILSON.

THE WHITE HOUSE, March 24, 1917.

And so, Mr. Chairman, instead of signing this order in May, 1917, the year after the war was declared by Congress, the President signed this order March 24, 1917, before Congress had declared war.

Here is another Executive order:

EXECUTIVE ORDER.

By virtue of the authority vested in the President by the act approved August 29, 1916, entitled "An act making appropriations for the naval service for the fiscal year ending June 30, 1917, and for other purposes," it is hereby directed that the enlisted strength of the Marine Corps be increased to 17,400 men.

WOODROW WILSON.

THE WHITE HOUSE, March 26, 1917.

That was before the war began. I wish to call your attention to that, and it was before Congress had acted.

It will thus be seen that instead of delaying until May 6 to authorize the emergency increase the President, with the foresight and promptness which marked all his actions before and during the war, issued his order increasing the enlisted force on March 24, 1917, at a time when the Bureau of Navigation was short something like 15,000 men, authorized by Congress in August, 1916. In other words, though the Bureau of Navigation had been directed on August 29, 1916, to enlist the full strength of the Regular Navy, it had been unable to do so up to April 1, 1917. The President's Executive order gave power to the Navy to enlist on March 24, 33,000 additional men.

At once I directed the Bureau of Navigation to start an active and energetic campaign to secure the authorized strength of the Regular Navy and solicited the cooperation of the press and all other patriotic agencies to secure the needed 35,000 men in the Regular Navy. On March 25 I sent the following telegram to the editor of every daily paper in the United States:

WASHINGTON, D. C., *March 25, 1917.*

The President has signed an Executive order directing that the authorized enlisted strength of the Navy be increased to 87,000. He was authorized by Congress in case of emergency to direct such increase in enlistment. New ships and ships in reserve are being fully commissioned as rapidly as possible, and the need is imperative for a larger enlistment to man them. There has been a net increase of over 6,500 in enlistment since Congress recently authorized an increase, but many more are needed and needed now.

That was March 25, 1917, before Congress had declared war, in writing to these editors, relying upon their patriotism and zeal, I asked this question:

Will you not emphasize this need by giving special prominence on the first page of your paper to the President's order and also by making an editorial appeal for new recruits for the Navy?

The Navy offers exceptional advantages to young men of stuff and ambition to serve in the first line for national defenses. In this emergency you have the opportunity and the privilege of performing this public service, and I am confidently appealing to you for your cordial and helpful cooperation.

JOSEPHUS DANIELS.

That telegram was printed conspicuously in most of the papers the next morning. Quite a number of the papers printed editorials calling upon the young men of the country to enlist in the first line of defense. The department began a vigorous whirlwind campaign; meetings were held in many cities, and by May 1 the enlistments had increased to 87,076, and before June 1 the full 97,000 had been enlisted, and the procession of patriotic, enthusiastic young men of America to enlist in the Navy was so large that I asked Congress to give authority and appropriations for a further increase. In compliance with my recommendation the Congress on May 22, 1917, temporarily increased the enlisted strength of the Navy to 150,000, and all during the war I kept in close touch with Congress which promptly approved the steady increase which from time to time the larger service required of the Navy made necessary.

On July 1, 1918, upon my recommendation, Congress authorized as the permanent strength of the Navy 137,835, and the temporary strength to 229,485, and increased the temporary strength of the

Marine Corps to 75,000. At this time (July 1, 1918) we had 206,950 regulars in the Navy, and the number increased to the maximum number of 218,457 on October 1, 1918. In addition to the 218,457 regulars on that date the number of reserves was 264,342, making a total of 482,799 enlisted and enrolled men in the Navy, exclusive of officers, and men and officers in the Marine Corps. If they are included the Navy in October, 1918, was composed of over 600,000 men. If they are included, Mr. Chairman, and if you will include the Marine Corps, which, of course, is an integral part of the Navy, the Navy on October 1, 1918, was composed of over 600,000 men, nearly 200,000 more than the British Navy.

The following table shows the steady increase in both the regular Navy and the reserves from April 1, 1917, until January 1, 1919. This table gives the figures showing—and I wish to call attention to the fact that although August 29, 1916, authorized to enlist over 20,000 more men, we were unable to get, until April 1, over 62,000 men, and up to January, 1916, we were 20,000 short. I carry the table on down, giving the regulars and reserves and the total up to the 1st of January, 1919—456,154.

The table referred to is here printed into the record as follows:

Total in Navy each month. Enlisted personnel, 1917–1918.

	Allowed by law. ¹	Regulars in service.	Reserves.	Total.
Apr. 1, 1917.....	96,982	62,667	8,079	70,746
May 1, 1917.....	96,982	87,076	24,450	111,526
June 1, 1917.....	162,466	109,010	38,064	147,074
July 1, 1917.....	162,466	128,666	46,319	174,855

¹ This allowed strength includes the hospital corps (3½ per cent of allowed strength of the Navy and Marine Corps).

Secretary DANIELS. The above tables show the net number in the service on the dates given below (it does not show losses by death and discharge and otherwise), but this does not do full justice to the great personnel work of the department during the war. Below is appended a table showing the total number enrolled and enlisted in the Navy each month from August, 1916, to December, 1918:

Enlisted personnel enrolled and enlisted during each month from August, 1916, to December, 1918.

	Regular.	Reserve.	Total.
1916.			
August.....		3	3
September.....	1,793	27	1,820
October.....	2,192	224	2,416
November.....	2,257	310	2,567
December.....	2,572	313	2,885
1917.			
January.....	3,512	326	3,838
February.....	3,359	1,347	4,706

October.....	1,325	11,539	12,864
November.....	851	1,443	2,294
December.....	2,488	197	2,685

The mission of the Navy in the World War must be considered with reference to all questions of personnel. Was the number 100,000 recommended by the General Board, 93,000 by the Chief of Bureau of Navigation in October, 1916, and 97,000 authorized by the act of August 29, 1916, as contemplated in 1916 in the plans for a war with Germany, adequate, and was reasonable foresight shown by the board, the bureau, the department, and Congress in view of the problem that presented itself at that time?

In 1916 we had certain definite and matured plans for war with Germany. It was believed that 100,000 men in round numbers would enable the Navy to carry out its mission in such a war. We did not, Mr. Chairman, then expect the Navy to be called upon to furnish 20,000 men for the armed guard, 42,161 on shore duty abroad, 29,175 men in the naval overseas transportation service, 21,817 in the naval transports for the Army, 7,272 to man 296 subchasers, 18,453 men to man 889 district vessels, and many other duties never contemplated for a naval war. The following table shows how the personnel of the Navy was employed on November 11, 1918.

Enlisted personnel afloat Nov. 11, 1918, exclusive of N. O. T. S.

Type.	Number of ships.	Number of men.	Type.	Number of ships.	Number of men.
Battleship force 1.....	24	21,278	Ships on detached service.....	9	1,000
Battleship force 2.....	14	18,372	Ships on special duty.....	18	4,273
1 fleet tender (yacht).....	1	75	Submarine chasers.....	296	7,272
Cruiser force.....	26	16,815	Eagle boats.....	3	201
American patrol detachment.....	13	3,653	Submarine tenders.....	13	2,753
Patrol force.....	58	7,448	Destroyer force tenders.....	7	3,785
Mine force.....	15	4,850	Transport force.....	42	21,817
Pacific Fleet.....	10	2,826	District vessels.....	889	18,453
Atlantic Fleet.....	18	2,415	Mine sweepers.....	17	707
Train.....	22	3,345	Canadian lighters and trawlers.....	22	440
Destroyer force.....	129	14,849			
Submarine.....	82	2,520	Total.....		160,567

In addition to naval vessels.

Total aboard naval vessels.....	160,567
Naval overseas transportation service.....	29,175
Armed guard.....	11,101
Port guard.....	4,000
Foreign service on shore.....	42,161

Total 247,004

The total number of enlisted men in the Navy on November 11, 1918, was as follows:

Ashore.....	260,603
Afloat and foreign service on shore.....	247,004

Total 507,607

That was on the day the armistice was signed.

To arrive at the proper conclusion, the following number of men should be subtracted from the above total, for the reason that the duty being performed by these men was not of the kind contemplated to be a part of the Navy's work as assumed in 1916 or previous, or, as a matter of fact, until after the very outbreak of the war in 1917.

The following list shows the number of men to be subtracted from above total afloat, because they were in a service different from that which had been contemplated prior to 1917:

	Ships.	Men.
Mine force.....	15	4,850
Submarine chasers.....	296	7,272
Eagle boats.....	3	201
Transport force.....	42	21,817
District vessels.....	889	18,453
Naval overseas transport service.....		29,175
Armed guard.....		11,101
Port guard.....		4,000
Foreign service on shore.....		42,161
Total.....		139,030

It was never expected that anything like 260,603 men would be on shore in this country. Most of them, in fact, were in training to meet the demand of the Shipping Board for 250,000 men, a service never contemplated that would be expected of the Navy. That number, therefore, we had enlisted for a service not naval, in any real sense, though the Navy undertook it and performed it along with many other new and unexpected demands. All these duties made demands upon naval personnel never contemplated in any plans or studies or estimates, or suggested by any naval officer in the entire service.

If we deduct the 139,030 on duties not in the plans, from the 247,000 men afloat, we have 107,974 men in the Navy on November 11 engaged in duties of a strictly naval character in keeping with the service required for carrying the mission of the Navy in the war as foreseen by the General Board and all the naval experts in 1916. This number compared with the General Board's estimate of 100,000 shows a difference of only 7,974 men, and the General Board and the department contemplated that all in excess of 100,000 would be provided by reserves. This was sound reasoning judged by all previous wars and all proposed plans. And, as a matter of fact, the naval reserve law enacted in 1914 and amended in the act of August 29, 1916, made provision not only for the small increase needed for strictly naval duties, but gave such wide latitude that we were enabled to enroll reserves for every strictly naval and collateral need.

REVIEWING ANCIENT HISTORY—THE ATTEMPT TO MAKE THE PERSONNEL ACTION OF 1914 BEAR UPON THE LESSONS OF THE WORLD WAR PROVES ABORTIVE.

I think it was Admiral Fiske and perhaps some others who have come before you complaining that I did not ask for as large increase in the enlisted personnel in 1914 as would have kept all the ships in full commission. It had never been the policy of the Navy Department to keep all the ships in full commission, and if I erred in not urging Congress at that time to give a large authorized increase in personnel, there are two reasons which had great weight in the course pursued:

1. I followed the policy that had prevailed for years of asking for only sufficient men to keep the later ships (those of 15 years or less of service) in full commission, a policy which had been often and fully discussed before the Naval Affairs Committee. Congress made authorization for men with the knowledge that the latest fighting ships would have the full complement fixed by the Bureau of Navigation, a certain number of older ships would be kept in reserve with a small crew, generally about 25 per cent, and others "in ordinary" with only sufficient personnel to keep the ships in condition. I may have followed an unwise precedent in asking for only enough men to keep up the policy established and carried out for years. Moreover, my immediate predecessor, although authorized to enlist 51,500 men, could secure only 47,357.

2. I asked for the number of men which the Bureau of Navigation recommended for a peace complement, based upon the principles stated by the General Board in that year, that of "keeping in full commission all battleships under 15 years of age," etc. On November 14, 1914, I addressed the following official communication to the Chief of the Bureau of Navigation:

WASHINGTON, November 18, 1914.

From: The Secretary of the Navy.
 To: The Bureau of Navigation, Navy Department.
 Subject: Increase of the Navy; building program and personnel, 1916.
 Reference: General Board's letter No. 420-2 of November 17, 1914.

In its report on personnel, in section 43, paragraph (a), the General Board makes the following recommendation:

"That legislation be asked for providing an active personnel, officers and enlisted force, capable of keeping in full commission all battleships under 15 years of age from date of authorization, half of the cruisers and all gunboats, and all

the necessary auxiliaries that go with the active fleet; and of furnishing nucleus crews for all ships in the Navy that would be used in time of war, and the necessary men for the training and other shore stations."

Now, as to the chiefs of bureaus:

The department desires a report from the bureau as to personnel available for carrying out the recommendations of the General Board above quoted, together with such comment and recommendation on the subject as the bureau sees fit to make.

JOSEPHUS DANIELS.

The report of the Bureau of Navigation in reply to my inquiry made an elaborate analysis of the personnel required to man the ships in accordance with the principle laid down by the General Board, closing its report with this statement:

After due consideration * * * the bureau sees no necessity for asking for an increase of enlisted personnel this year; but believes it will be necessary to do so next year, if the recommendation of the General Board is approved.

Following this statement from the Bureau of Navigation, the bureau charged with supplying all personnel, I made no recommendation for increase in 1914, but in 1915 asked for an increase, and in the next bill that became a law secured a war increase to 97,000—a much larger number than had hitherto been asked for by any Secretary of the Navy, indeed twice as many as on March 5, 1913, when I became Secretary of the Navy.

The full text of the reply to my letter of November 18, 1914, to the Chief of the Bureau of Navigation is as follows:

NAVY DEPARTMENT,
BUREAU OF NAVIGATION,
Washington, D. C., November 18, 1914.

From: Chief of Bureau of Navigation.

To: The Secretary of the Navy.

Subject: Increase of Navy, etc.

Reference: Department's letter, etc., quoting recommendations of General Board.

1. The bureau has carefully considered the subject of personnel in connection with the General Board's recommendations regarding the organization of the fleet as expressed in section 43, paragraph (a), of the above reference, and respectfully submits as follows the requirements in personnel to put into effect the General Board's recommendation:

CLASS A.—Active fleet to be in full commission at all times in training for war.

	Number of ships.	Line officers.	Enlisted men.
Battleships.....	21	630	17,425
Destroyers.....	35	140	2,274
Destroyer tenders.....	3	14	638
Submarines.....	28	56	539
Submarine tenders.....	6	24	900
Armored cruisers.....	5	150	4,015
Cruisers.....	11	117	3,493
Transport.....	2	12	300
Supply ships.....	3	12	450
Repair ships.....	2	14	460
Ammunition ship.....	1	4	55
Mine depot ships.....	2	18	564
Fleet tugs.....	6		180
Hospital ship.....	1		55
Total.....	126	1,191	31,348

As to fleet tugs, there were no officers there, because we employed practical marine men to manage them.

As to the hospital ship, the officers on that ship were medical officers and not line officers.

CLASS B.—*Gunboats that may be serviceable for cruising, patrol, and other duties in times of peace.*

	Number of ships.	Line officers.	Enlisted men.
Gunboats.....	27	133	3,015
Total for class A and B (all vessels in full commission).....	153	1,324	34,363

CLASS C.—*Vessels of more or less military value to be held in reserve with nucleus crews in time of peace and to be placed in full commission in time of war.*

	Number of ships.	Line officers.	Enlisted men.
Battleships.....	8	40	1,680
Armored cruisers.....	5	25	1,250
Old destroyers.....	16	32	320
Old torpedo boats.....	12	12	120
Old submarines.....	7	7	70
Cruisers.....	10	20	730
Old battleships (ordinary).....	4	8	240
Old monitors (ordinary).....	3	3	180
Total.....	65	146	4,590
Class A, battle fleet.....	126	1,191	31,348
Class B, gunboats.....	27	133	3,015
Total.....	218	1,471	38,963
Flag officers, flotilla commanders, staffs, etc.....		50	
Total line officers.....		1,521	

NOTE.—The above figures show the personnel required for all vessels on the Navy list not in possession of the Naval Militia which, in the opinion of the bureau, may be of possible service in time of peace or war. It will be noted that a number of the vessels in classes B and C are of doubtful value either in peace or war, owing to their age and material condition. However, the bureau has provided personnel for them.

Class D is next:

CLASS D.—*Personnel required to full commission all vessels of class C which are held in reserve with nucleus crews in time of peace.*

	Number of ships.	Line officers.	Enlisted men.
Battleships.....	8	140	3,514
Armored cruisers.....	5	125	2,705
Old destroyers.....	16	32	84
Old torpedo boats.....	12	24	240
Submarines.....	7		
Old battleships.....	4	16	2,184
Cruisers.....	10	90	3,691
Old monitors.....	3	21	420
Total.....	65	512	13,678
Total required in classes A, B, and C.....		1,521	38,953
Grand total.....	218	2,033	52,631
Now in service.....		1,872	52,293
Apparent shortage for war.....		161	338

(Extract from Secretary's report, 1914.)

Now, the Chief of the Bureau of Navigation continues:

While the apparent shortage to commission all serviceable vessels for war is only 161 officers and 338 men, if it is borne in mind that there are many

duties required by both officers and men ashore in time of war that must be provided for from the active personnel in order that the efficiency and effectiveness of the fleet may be maintained.

In regard to officers, the great majority of those now on shore duty would be relieved by retired officers and sent to sea upon the outbreak of war.

That is exactly what did happen.

The bureau has considered the requirements in this particular and believes that a minimum of 160 active line officers should remain ashore in time of war, otherwise the organization would be so disrupted that the efficiency of the fleet would be seriously impaired. In this connection attention is invited to the fact that 135 officers and 3,015 enlisted men have been assigned to gunboats primarily for peace duties. There is no doubt that in time of war these vessels, or many of them, would either be interned in foreign ports or brought home for service on the coast patrol, and manned by the naval militia or other reserve forces.

As a matter of fact, nearly all those ships were manned in time of war by the reserve forces.

This would release their personnel for service with the fighting fleet.

Assuming that two-thirds of the personnel of gunboats were so released, there would in this way become available 90 officers and 2,000 enlisted men.

There are at present serving on surveying ships and on fish commission ships 28 officers and 622 enlisted men. These would also become available for the fleet in time of war, making 90 plus 28 equals 118 officers and 2,000 plus 622 equals 2,622 enlisted men.

The bureau is therefore of the opinion that there exists at the present time a shortage of 161 plus 160 minus 118 equals 203 line officers required to place in full commission all vessels of the Navy serviceable for war purposes.

And I may add, Mr. Chairman, the only place we then had to get officers from was the Naval Academy, and we had secured every officer that academy had graduated.

In estimating the shortage of enlisted men, consideration must be given to the requirements of the service in connection with training stations, tugs, station ships, recruiting, etc., as given in the table below, showing the present distribution of the enlisted personnel in duties other than at sea with the fleet, class E.

CLASS E.

	Men.
40 navy-yard tugs.....	619
Caring for Naval Militia ships.....	108
Station ships, yard craft, etc.....	846
Training stations and trade schools.....	4,075
Recruiting stations.....	375
Radio stations.....	258
Ships building.....	111
Navy yards and shore stations.....	880
Insular force.....	356
General detail.....	750
Prisoners, leave, traveling, etc.....	2,752
Hospitals.....	1,388
Total.....	12,518

In case of war the following numbers can be drawn on from the above and sent to sea:

From item 2.....	108
From item 3.....	300
From item 4.....	3,000
From item 7.....	111
From item 8.....	400
From item 10.....	750
From item 11.....	1,000
Total.....	5,668

Remaining ashore in time of war, 12,518 minus 5,669 equals 6,849 unavailable for sea duty. To this must be added the apparent shortage of enlisted men shown above as 338, making a further apparent shortage of 7,187, from which should be subtracted 2,622, the number gained from gunboats and from surveying and fish commission vessels, making an actual shortage of men to man all vessels serviceable for war purposes of 4,565.

CONCLUSIONS OF THE BUREAU OF NAVIGATION.

From the foregoing figure the bureau concludes that, for purposes of placing in full commission all vessels of the Navy serviceable for war purposes at the present, there is a shortage of 203 line officers and 2,565 enlisted men.

Probable requirements for commissioning new ships within the next year:

	Men.
2 battleships	1,500
6 destroyers	450
10 submarines	200
1 destroyer tender	250
2 submarine tenders	300
Total	2,700

Available during next year to commission new ships—

	Men.
From general detail	750
From ships building	111
Available for enlistment to fill average authorized quota	753
Total	1,614
Required for new ships next year	2,700

Shortage

1,086

Carrying out the plan of retaining in full commission the 21 latest battleships and of maintaining a sufficient number of submarine tenders—

	Men.
2 battleships (Virginia class) would be placed in reserve, thus gaining ..	1,170
2 submarine tenders out of commission, to gain	300
Gain	1,470
Shortage	1,086

Surplus after commissioning all new construction next year

385

After due consideration of the foregoing figures the bureau sees no necessity for asking for an increase of enlisted personnel this year, but believes that it will be necessary to do so next year if the recommendation of the General Board is approved. The question of the shortage of officers is much more urgent than that of enlisted men—

And in the war we found that was true—

as a sufficient number of ex-service men to fill vacancies in war complements can be readily obtained on the outbreak of war. But as the supply of officers is limited to the output of the Naval Academy, it will necessarily be several years before the needs of the service in this respect can be filled if all vessels of the Navy serviceable for war purposes are placed in full commission.

No estimate is made for colliers, as existing law contemplated manning those vessels from other sources than the enlisted personnel of the Navy.

The bureau believes that a naval reserve organized from the honorably discharged enlisted men now in civil life should be created within the next year.

Subject to the foregoing remarks, the bureau concurs in the recommendations of the General Board quoted in the department's letter, and believes that the policy recommended would increase the efficiency of the Navy to a maximum not only in material but in the distribution of the personnel to the best advantage.

VICTOR BLUE.

PERSONNEL SITUATION, 1914.

From May, 1914, the authorized complement for enlisted men of the Navy was completely filled for the first time in several years, and the waiting list of applicants for enlistments had to be established. This was a result of the policies of education and extending the opportunities for enlisted men in the Navy and of giving wider publicity through the country of the Navy's work. On June 30, 1913, the enlisted strength of the Navy was 48,068, and on June 30, 1914, there was 52,667, showing a net gain of 4,612 during the year, a number sufficient to man five dreadnaughts and seven destroyers. There was also a large gain made in reenlistments of trained men during this year, the percentage of reenlistments for the fiscal year 1914 being 57 per cent, while that of 1913 was 65 per cent. During the year ended June 30, 1914, there were 88,943 applicants for enlistment. Of these, only 18,948 were accepted, and of this number 5,168, nearly one-third, had served one or more enlistments in the Navy. The general situation in regard to the enlisted personnel of the Navy and the policies of the department in regard to the personnel is set forth in my annual report of December 1, 1914, pages 24 to 28, from which the following is quoted:

Enlisted men.—It has been the policy of the department to raise the standard of the enlisted personnel by opening the door of opportunity to the worthy, and by weeding out the unworthy, who bring discredit upon the uniform of our sailors. In consequence of this policy, the recruiting officers are enabled to pick and choose among the applicants for enlistment, and a greater percentage of men are reenlisting. When the information is disseminated throughout the country that the position of an enlisted man in the Navy is an honorable one, and that none but those of good character are taken, that every man who enlists has the opportunity of getting an education, without expense to himself or his family; that he has the opportunity of learning a useful trade, and that if he wishes to make the Navy his life work he has the opportunity for advancement through the various grades of petty officer, warrant officer, and commissioned officer to the highest rank in the Navy, it is but natural that young men of the highest type of American manhood will be more and more attracted to the Navy, and that their parents will not only encourage but urge them to enlist. It is not surprising, therefore, that the Navy's authorized complement, which was short for several years, was completely filled in May, 1914; that recruiting had to be suspended in order not to exceed the limit authorized by law; and that a waiting list of applicants for enlistment had to be established. During the fiscal year ended June 30, 1913, the enlisted strength of the Navy reached a total of 48,068, and in the fiscal year ended June 30, 1914, a total of 52,667, showing a net gain of 4,612 men during the year, the number required to man five dreadnaughts and seven destroyers. The percentage of men who, by the character of their discharge, were entitled to reenlist and who reenlisted during the fiscal year of 1913 was 57 per cent. The same for the fiscal year of 1914 was 65 per cent, or a net gain of 8 per cent.

The total number of men serving under reenlistment in 1913 was 16,983. The same for 1914 was 18,640, or a net gain to the Navy of 1,657 experienced men—enough to fully man two of the latest dreadnaughts. During the fiscal year ended June 30, 1914, there were 88,943 applicants for enlistment. Of these, only 18,948 were accepted, or about 1 in 5. Of this number, 5,168 had already served one or more enlistments. These figures indicate the high standard required of recruits, and show that there is no lack of fit men who desire to enlist in the Navy.

In view of this gratifying condition, the department has not found it necessary to retain in the Navy men who are undesirable from any point of view, or men who for various personal reasons desire to sever their connections with it in an honorable status.

* * * * *

Distribution of personnel.—The proper distribution of the personnel is a question which involves economical problems no less important than are the proper expenditures for material requirements. The main object in all considerations is to attain the highest efficiency in the fighting fleet. Since the upbuilding of the modern Navy began many vessels have been added to the Navy list from time to time which, although serviceable for war purposes in their day, are now obsolete for modern warfare. Many of these vessels are now in service for patrol duty in southern waters and elsewhere. In case of war, many of them would be brought home and turned over to the Naval Militia or other reserve force and utilized in the naval-defense districts on the inner line of patrol. Their personnel would be transferred to ships of fighting value.

In time of peace it is desirable to utilize a number of such vessels for patrol and cruising duty, as they are less expensive to maintain than are the vessels designed for the fighting line. Naturally, if all vessels of the Navy, including those referred to are to be kept in full commission in readiness for immediate war with a first-class naval power, many more officers and men would be required than are at present authorized; and there would be an increasing demand from year to year for more men to man the vessels newly constructed. Happily, however, the necessity for such a condition is not apparent, and the finances of the country should not be overburdened to provide for such contingency.

The General Board in its report (printed as an appendix) recommends in section 43, paragraph (a), that personnel be provided for certain classes of ships named in the report. By wisely utilizing the present enlisted personnel all ships of the classes named can be maintained in full commission without addition to the present enlistment and therefore no legislation is needed to carry out their recommendation. This is clearly shown in a report by the Chief of the Bureau of Navigation, which is printed in the appendix on page 64.

It is estimated that more than 90 per cent of the effective fighting power of the Navy is now fully manned. And this percentage will be increased proportionately as new ships are placed in active service by taking the crews from the older ones of little or no fighting value. It is conservative to say that the dreadnaught *Pennsylvania* in fighting value is worth four or five old battleships and an indefinite number of old cruisers, yet she requires no more men than an old battleship or two or three of the old cruisers. In other words, 800 men on the *Pennsylvania* are as effective as 4,000 men on old battleships or as many thousands on old cruisers.

This comparison should be borne in mind if the question arises whether the personnel should be increased at the expense of new construction. Owing to the financial condition of the Treasury, due to war conditions abroad, the department does not ask for more men this year, but intends, by the distribution of the personnel to the best advantage, not only to maintain the effective fighting strength of the Navy, but to increase it proportionately as ships now under construction are completed and added to the Navy list during the next year. Since March, 1914, the department has placed in full commission 12 more vessels of the older type than were deemed necessary a year ago. These were in addition to the vessels newly built and were demanded by the situation in Mexico.

The department was enabled to meet this increased demand on the personnel by recruiting to the authorized strength during the year and thus gained 4,600 more men than were in the service last year.

It is for the Congress to establish the effective strength at which the Navy shall be maintained, both in personnel and in material, and for the department to advise as to the proper balancing of the two. For the reasons given above the department is strongly of the opinion that any retrenchment that may be deemed advisable on account of the financial condition of the Treasury should not be in new construction—

I wish to emphasize that, Mr. Chairman, because at the time the great fight we were having was as to whether we could get two battleships or one—

For the reasons given above the department is strongly of the opinion that any retrenchment that may be deemed advisable on account of the financial condition of the Treasury should not be in new construction, as it has pointed out that, if deemed necessary, the present authorized personnel can take care of the new ships that will be added to the Navy in the next two years by with-

drawing from service old vessels of little or doubtful military value. Later on, however, increase in personnel should keep pace with new construction. In the meantime there will necessarily have to be placed in reserve from time to time vessels which, although not sufficiently up to date for the fighting line, can render good service in coast defense. For the manning of such vessels and of the auxiliaries which would be required with the fleet in time of war a naval reserve is necessary and should be organized and trained at the earliest practicable date.

Mr. Chairman, you have heard retailed here gossip as to some communication I held with the General Board of the Navy in 1914, and I think it was Admiral Fiske who undertook to convey the impression that I had directed the General Board to cut out certain recommendations as to increase of personnel. Such an impression would do injustice to the General Board as well as to me. Not once, but at least twice, or probably three times, I have suggested to the General Board the omission of certain specific recommendation in their reports which would be printed as appendices in my annual reports. In each case I suggested that those particular recommendations not to be published should be contained in communications for the study of the Secretary of the Navy and of Operations. It is manifestly proper that certain of their recommendations should be confidential. Most of them are.

My relations with the General Board have been such as to justify the utmost free and confidential exchange of views. When an ex officio member of the General Board so far forgets his sense of the proprieties as to gossip about those communications he publishes his unfitness for membership on that board and loses his usefulness. In the latter part of 1914 the Bureau of Navigation had succeeded for the first time in years in securing the enlistment authorized by law. My opinion was that the big immediate and difficult duty was to concentrate on getting appropriations for capital and other fighting ships and on teaching and training the more than 50,000 men then enlisted and in keeping that strength up to that number authorized before I should ask an increase. I am frank to say that at that time I did not believe the spirit of the country and Congress was in a mood to vote the money that would be required for a large increase, and also money for two dreadnaughts. An increase of 20,000 men, as I am informed by Supplies and Accounts, would necessitate an additional appropriation of \$16,000,000.

I know it would be extremely difficult to secure the money for large increase in personnel and for the new ships the General Board felt necessary and the number for which I had estimated. As obtaining money for new dreadnaughts was paramount and as Navigation reported we had sufficient men to man the best ships, I did not ask the money for the increase of men, but stressed the fight—and it was a hard one—to secure enough money for the new dreadnaughts and other fighting ships. The recommendation of the General Board as forwarded to me and published as an appendix to my report (see Appendix A, p. 68, Report of the Secretary of the Navy, 1914) was in these words:

43. In view of all that has been herein set forth, the General Board recommends:

(a) That legislation be asked for providing an active personnel, officers, and enlisted force, capable of keeping in full commission all battleships under 15 years of age from date of authorization, all destroyers and submarines under 12 years of age from authorization, half of the cruisers and all gunboats, and all the necessary auxiliaries that go with the active fleet; and of furnish

ing nucleus crews for all ships in the Navy that would be used in time of war, and the necessary men for the training and other shore stations.

(b) That the general policy be adopted of expanding the active personnel with the expansion of the fleet in the proportions indicated in (a).

(c) That immediate steps be taken to form a national naval reserve of trained officers and men, and that this work be pushed until this reserve in connection with the Naval Militia has reached the point where, combined with the active list, it will be possible to fully man the entire fleet with war complements and furnish 10 per cent additional for casualties.

(d) That the Naval Militia be expanded in number and that the department encourage the continuance and improvement of its training to the end that it may still more efficiently serve to reenforce the Regular Service at need

GEORGE DEWEY.

I suggested to the General Board that it stress the building program, lay down the general principles of personnel, omitting any particular number of increases in that year. The Chief of the Bureau of Navigation recommended as complements for the ships enough men in his judgment—and that was his duty prescribed by law—for manning the ships of the Navy in accordance with the recommendation of the General Board.

The CHAIRMAN. Was this suggestion of the board made orally or in writing?

Secretary DANIELS. Orally. The board never then or since intimated to me that my suggestions were not entirely proper, and I published the report at it was forwarded to me. It was never, Mr. Chairman, until I had refused to approve Admiral Fiske's plea to reorganize the Navy Department on plans "made in Germany," patterned after the Von Tirpitz method, and had not yielded to his repeated solicitations to make him commander in chief of the Atlantic Fleet, that this comparatively unimportant confidential talk with the General Board was given currency and an airing in Congress long before the United States entered the World War. Inasmuch as I recommended an increase in 1915 and Congress gave the large increase in August, 1915, larger than the Bureau of Navigation could enlist before we entered the war, the addition of a few thousand men, more or less, in 1914, would have exerted no perceptible influence in a great war in which we enlisted and enrolled more than 500,000 men in the Navy. To hark back to this warmed-over criticism serves only to show that this investigation, limited by the resolution to the part the Navy played in the World War, is regarded by some as merely an opportunity of airing ancient grievances without contributing anything of value to lessons taught by the World War.

Mr. Chairman, I had the fight of my life, working with the majority of the Naval Affairs Committee, led by Chairman Padgett, to secure an appropriation for two battleships in that bill, as the following extract from the Congressional Record, February 5, 1915, page 3438, shows:

Mr. Witherspoon moves to recommit H. R. 20975 to the Committee on Naval Affairs with instructions to forthwith report the bill back to the House with an amendment striking out the word "two" where it occurs in line 4, page 64, and insert the word "one" in place thereof.

The vote stood yeas, 149; nays, 165. Representative Witherspoon, backed by nearly half the Members of the House, made a hard fight to prevent my recommendation, incorporated in the bill by the Naval Affairs Committee, for the two battleships, being adopted. His mo-

tion was to build only one dreadnaught and a change of eight votes would have reduced the building program in that bill to one dreadnaught instead of the two secured. An analysis of the vote shows that both of the leaders of the two parties (Mr. Mann, Republican, and Mr. Underwood, Democrat) voted for recommitting the bill with instructions to substitute "one" for "two." This vote is significant as showing the public attitude and the attitude in Congress at that time, and no discussion now of what might have been done two or three years before we entered the war has any value without the sidelight of public opinion as represented by a large element in Congress in opposing the two-battleship construction urged by the Secretary of the Navy and approved by the President. I believed then, and the General Board agreed, that in comparison with securing the money for two dreadnaughts, everything else was less important. Besides, I recommended in 1915 and actually secured in 1916 all the men needed for the new ships and secured them before the ships were even launched; and never during the World War, with an increase from 342 to over 2,000 vessels to be manned, was a ship ready for service that the department did not have enough men ready to man it. So much for this backstairs gossip about 1914 and like ancient history.

PERSONNEL—COMPLEMENTS OF SHIPS—VARYING VIEWS HELD BY NAVAL OFFICERS AT DIFFERENT TIMES AS TO THE NUMBER OF MEN NEEDED ON A FIGHTING SHIP.

The naval legislation passed on August 29, 1916, stands out beyond all precedence in naval legislation looking toward preparing the Navy for war. It not only provided a continuing program for new construction to follow a definite plan for a period of three years, but it also provided for the personnel to adequately man the ships built and those to be constructed, and made provisions for promptly increasing the personnel to meet the sudden demands of war. To do this it was only necessary for the President to issue an order when the emergency arose to increase the strength by 18,300 men in the Regular Navy, which he issued on March 24, 1917, several days before Congress declared war. This act also provided for an unlimited reserve force under such regulations as to make service in the reserve force of the Navy attractive to thousands of American citizens, and to give adequate personnel for any needed service in war.

The terms of this law were largely a result of the careful study which had been going on for the preceding two years as to the requirements of the Navy in both numbers and types of ships and size of personnel. As a matter of fact, the size of the enlisted personnel of the Navy had been a question much discussed for several years, and it is interesting to note how opinion varied as to the number of men necessary to fight a ship changed as time went on. The wise increases in personnel suggested were largely a result of the development of the gunnery efficiency of the ships and of the methods to control the fire of the guns in battle.

To have a correct understanding of the personnel situation in the Navy it is necessary to study the development of the Navy and particularly its developments in gunnery efficiency during the past 20 years, because the number of men in the Navy has varied not only by the increased construction of ships, but by the establishment of certain principles governing the fighting of the ship in battle and the

experience gained in holding imitation battles in target practice where the principles were put to a test. In 1905 there was appointed the first board of officers to analyze the study the most up-to-date ideas in regard to the principles above mentioned for fighting a ship in battle and to formulate in detail the methods which should be carried out in accomplishing this. This board was called the fire control board, as it directly considered the method of controlling the gun fire of a ship. This board submitted a report outlining methods of training, types of installation, result to be accomplished, etc. Following this report there have been other boards appointed from time to time to study the proposition and to devise policies and methods so as to keep in step with the advances made in the knowledge of the subject and in the development of electrical and mechanical instruments.

This has been one of the biggest subjects in discussion in the Navy during the past 20 years and necessarily there have been numerous and divergent opinions among the officers of the Navy as to what should be the correct action and procedure to be established by the Navy Department. I am giving here a brief summary of the reports of the various boards on fire control of 1905, 1910, 1915, 1916, and 1919. I think this is a very important and an illuminating statement.

A brief summary of the reports of the various boards on fire control is given in the following pages. From the extensive studies made of the subject as indicated it would be evident that no one man's opinion could be taken as paramount to all others even though he might have a very plausible argument to support his position. The desire of the department has been at all times to obtain the best answer under all the circumstances to the problems at issue.

BOARDS ON FIRE CONTROL.

First board ordered by Navy Department November 21, 1905. Report of board submitted under date of December 20, 1905. Report lays down certain general fundamental principles which it thought should govern the organization for manning the battery of a ship and the fire-control stations and for controlling the fire of the ship as a whole. It also gives in detail the stations to be manned and the officers and men required for these stations.

For a mixed caliber having 12-inch gun turrets and 8-inch gun turrets and 7-inch guns of the broadside battery, it was estimated that officers as follows would be required for this type of ship:

Officers of grade of lieutenant and above	15
Junior officers of grade of lieutenant (junior grade) and below	20
Total	35

The number of men required for the entire battery of the ship was not tabulated.

FIRE-CONTROL BOARD OF 1910.

Ordered to convene December 14, 1909. Date of report, January 15, 1910. This board had under consideration reports of boards from the Atlantic Fleet, fire-control board of 1905, and the torpedo-defense board of 1907. This report continued the study of a fire control in accordance with the principles as laid down in 1905, with the neces-

sary revisions and extensions to conform with the type of ship in the Navy at that time and to meet the demand of experience in fire control in the previous five years. A ship of the *Connecticut* class was believed by the board to require 50 officers instead of 35. The stations to be manned were described, but the total number of men per ship was not tabulated.

Report of 1915, Capt. Roy Smith, senior member; appointed May 1, 1915; reported August 11, 1915. The board considered the previous reports of 1905 and 1910 and also the reports of boards convened in the Atlantic Fleet. December 27, 1915, Chief of Naval Operations ordered board, with Capt. C. P. Plunkett as senior member, to review the report from the 1915 board in connection with comments which had been made on this report. The original report of Capt. Smith's board of 1915 was not promulgated.

FIRE-CONTROL BOARD OF 1916.

On February 5, 1916, the department approved the report of 1915, as revised by the officers ordered for this purpose on December 27, 1915. This report further elaborated and brought up to date the comprehensive plan for fighting the battery of a ship as a complete unit. The board's opinion was influenced by previous experience and by development of electrical appliances which could be used for purposes of fire control. In this report it was considered that it is only necessary to completely man at one time half the battery of torpedo defense guns, those on one broadside, the idea being that the attack from a torpedo boat would probably come from one side at a time.

This report commented on the "director firing" system for the ship's battery, and, although it was not able to give a final description of the details of this system, it recommended completing the development of the director firing installation. The board foresaw many valuable possibilities in this system.

The board stated that—

The recommendations of this board are intended to apply fully and completely to all ships designed after the final approval of this report.

For ships under construction it is recommended that as many of these features be adopted as practicable.

When the report of this fire-control board was approved by the department on February 5, 1916, it was considered that the most up-to-date methods of fighting a ship had been determined.

In accordance with the analysis made by this board, it was recommended that further increases in the ships' complements would be necessary, and increases were authorized by the department.

FIRE-CONTROL BOARD OF 1919.

In accordance with orders from the Navy Department of March 19, 1919, a fire-control board, of which Capt. W. D. Leahy was senior member, convened on May 1, 1919, and on June 9, 1919, report of this board was issued to the service. The duty of this board was to "revise and to bring into agreement with the latest developments of naval gunnery the fire-control instructions at present in use." Its conclusions were based on information and experience obtained during the war and was affected by the further development of various electrical mechanical appliances.

In other words, this report of June, 1919, is our latest word from naval officers on the installations necessary and the methods to be used in fighting a ship in battle, and covers every detail with great thoroughness.

From this report it is easy to determine the number of officers and men believed by the board necessary to man every station in battle. A study of this report shows to what extent the vacancies may exist, in time of peace, in what might be called a perfect fighting complement without seriously affecting the military value of the ship. While all the stations are important yet there are a number which do not require extensive training and could be filled by recruits who could become proficient in a very short period of training, the point being that the complete organization is held in effect at all times.

There were certain conditions which developed during the war that made naval officers believe that a greater number of men were required than had been previously contemplated, one of these being the necessity for a greater number of lookouts on duty at all times to watch for a submarine attack. Another was that the experiences in the Battle of Jutland demonstrated the necessity for keeping all the broadside battery guns manned at all times during battle, as it was found that the torpedo attack developed so rapidly that it was not practicable to send the guns' crews from one side of the ship to the other to defend against the attack as had previously been considered satisfactory.

The above outline of the studies made in the development of naval gunnery and methods to be used in battle is given in order to show the vast amount of study which has been given this subject, as it is necessarily the controlling factor in assigning the complement of men to a ship which, as mentioned before, is one of the determining factors in the size of the personnel of the Navy. This also shows why the number of men found necessary when a ship is completed may be more than that contemplated when the ship was designed some three years or more previously.

It was not until 1905 that a definite plan in detail based on sound fundamental principles was worked out to govern the control of the fire of a ship as a whole. Previous to that time attention has been principally concentrated on developing the efficiency of individual turrets or gun crews and sufficient attention had not been given to delivering a full volume of fire from all the guns of a ship at the same time, and it was largely a result of these studies and analyses which caused the adoption of the so-called single caliber ship and this also resulted in the adoption of the design of placing all the turrets on the center line of the ship. This was one of the most progressive steps taken in battleship design in which the American Navy led the world.

The following table will show how the complements for different ships have varied from time to time, and it is interesting to note how these complements have been influenced by the studies made of the subject of fighting the ship. For instance the *Michigan* was laid down in 1906 with a designed complement of 708 men. She was first commissioned in 1910 with an assigned complement of 715 men. This number was undoubtedly governed by the fire control board's report of 1910. After being out of commission she was again placed in commission in 1917 and her prewar complement

was 871, this being influenced by the board's report of 1916 which, previous to the war, was the most comprehensive report that had been made. During the war there were approximately 1,000 men on the *Michigan*. Her present assigned complement is 1,032, this being recommended by the experiences of the war and the fire control board's report of 1919. The allowed complement for peace time is 942. In other words, the *Michigan's* complement changed from 708 when designed, to 942 at the present time, with 1,032 men believed by officers studying the matter necessary for fully manning each battle station.

Now, you take the *New York* and the *Texas*. They are an example. They were sister ships. We had officers of high experience make estimates as to how many men ought to be on the *New York*, for instance. When she was built the naval authorities said 902 men ought to be the complement of the ship. In 1915, they had a fleet board and the fleet board said it ought to be increased to 1,094. The prewar complement was 962. The war complement, fixed in July, 1917, was 1,060. The number on board during the war was 1,300. The present complement is 1,352. The Bureau of Navigation complement is 1,158. And, Mr. Chairman, if you will follow these increases in all these ships we have built, you will find varying differences of opinion on all the ships.

The truth is that as to the number of men needed on a ship is not a question capable of arithmetical settlement. If we had—as we will have when men are enlisted and paid in accordance with their mechanical expertness—only well-trained men on a dreadnaught the number required would be much less than when a large number are young, inexperienced, and under training. I believe we will reach a time when the pay of experienced men in the Navy will be raised so as to make service in the Navy more attractive, and then we will have smaller complements than are required with a force in which a large percentage must be taught the duties afloat.

¹ March.

The various conditions and opinions as affecting the enlisted personnel of the Navy was well set forth in my statement before the Naval Committee of the House of Representatives on December 31, 1918, which is quoted as follows [reading]:

It seemed to be universally agreed by all naval experts that in passing from the predreadnaught class of battleship to the dreadnaught, a reduction in the cost of maintenance would result because of two factors: (a) that the small ship with a great number of small-caliber guns required more men and officers than a larger ship with large-caliber guns only, therefore the complement of a dreadnaught would be less than the complement of the predreadnaught; (b) the change from the coal-burning to the fuel-oil-burning battleship would reduce the complement of the dreadnaught as compared with the predreadnaught.

While only the latest battleships have been oil burners exclusively, and although a reduction in the engineer's force has resulted, nevertheless the complements of the ships of the Navy have been constantly increasing and have been increased far beyond the designed complement at the time the ships were laid down.

Let me read you a letter from President Roosevelt.

On January 11, 1907, President Roosevelt, in advocating the authorization of the "all big-gun ship" in his message to Congress, stated as follows upon recommendation of the experts of the Navy Department.

This has a bearing as showing that there are a number of officers of the Navy who now wish to have more ships and more men on the ships than there are accommodations for. President Roosevelt said:

"Moreover, though a large ship consumes more coal, a small ship having a large number of small guns (6-inch, etc.) actually requires more men and officers than a large one having heavy guns only, and consequently each small ship costs at least as much to maintain and repair."

This was President Roosevelt in 1907.

"For example, the complement of a dreadnaught of 18,000 tons is 690 officers and men!"—

That is, of the new dreadnaught in his day; the last word in his day—

"While that of the *Louisiana* of 16 000 tons is about 850."

In 1910, the war complement of the *Louisiana* was stated at 954 men and the peace complement as 834 men, while in 1915, a report from the fleet itself placed the peace complement of the *Louisiana* at 1,137 men. The *Louisiana* is cited because in 1907 the experts, in advising President Roosevelt, placed the complement at 850 officers and men.

For instance, the *New York*; the designed complement is 902 enlisted men. In 1915 the complement was stated at 1,094 as flagship, and to-day she has on board, 1,444 men as a flagship, and the peace complement, as determined by a board now in session in the fleet, will be probably 1,410 men. Another instance is the *Delaware*, whose designed complement was 830 men; in 1915, 981; to-day 1,094, and the board in session in the fleet will probably recommend a peace complement of 1,247 men.

When the plans for the modern dreadnaughts were laid down such ships as the *Pennsylvania* and *Arizona* were designed to carry 937 men, but the number of enlisted men actually on board to-day is 1,440 for the *Pennsylvania* and 1,540 for the *Arizona*. While it is true that the battleship force has been used for training purposes during the war there is, nevertheless, a board in the fleet now in session to recommend the complement of the battleships, and it is probable they will recommend a complement of about 1,420 men for the *Pennsylvania* and 1,490 men for the *Arizona*. This is an increase of 556 and 626 men, respectively, over the designed complements in time of peace.

The following table submitted in my hearings in December, 1918, at the time mentioned is inserted, as it also illustrates the difference in opinion:

Ships.	Guns.	Designed complement. ¹	Fuel.	Complement, officers and men.	
				Fleet board reported in 1915.	Chief of Bureau of Navigation at present for peace.
New York.....	10 14-inch; 21 5-inch.....	902	Oil burner and coal.	1,094	1,444
Arkansas.....	12 12-inch; 21 5-inch.....	916	do.....	1,200	1,453
Wyoming.....	do.....	915	do.....	1,200	1,460
Texas.....	10 14-inch; 21 5-inch.....	902	do.....	1,069	1,417
Delaware.....	10 12-inch; 14 5-inch.....	870	do.....	981	1,247
North Dakota.....	do.....	870	do.....	1,009	1,087
Utah.....	10 12-inch; 16 5-inch.....	828	do.....	1,188	1,270
Florida.....	do.....	837	do.....	1,188	1,275
South Carolina.....	8 12-inch; 22 3-inch.....	708	Coal only.	1,157	1,218
Michigan.....	do.....	708	do.....	1,157	1,026
Kansas.....	4 12-inch; 8 8-inch; 12 7-inch; 18 3-inch.....	844	do.....	1,078	1,217
Nebraska.....	4 12-inch; 8 8-inch; 12 6-inch; 12 3-inch.....	798	do.....	1,041	1,060

¹ Exclusive of marines.

² Flag ship.

The last report of the Bureau of Navigation was 1,400. Now, 1,400 is just as much too many as 900 is too small.

These studies and reports as above mentioned endeavored always to arrive at the number of men necessary to man every station for fighting the ship. In other words, it gave the ideal complement of a ship. Having determined what the ideal complement of men would be, it was then necessary to study the spaces available in the ships already built to see if the men could be properly quartered on board; and after the comprehensive report of 1916 was submitted it was found that a great many of the ships then completed and in service did not have sufficient space to adequately quarter the ideal number of men recommended for service on the ship. It was in regard to this that Admiral Plunkett made the following statement before the committee:

In 1915, when the question of shortage of personnel was most acute on the vessels—

In 1915, bear in mind, Mr. Chairman; that was the year I recommended an increase in personnel which, in the bill of August, 1916, went up to 97,000—

which were in commission, there was a great deal of loose talk, and there were memoranda and reports and other things as to the number of men required to man a ship efficiently. As a matter of fact, we have some definite information from the people who designed the ship that the number of men that we thought we needed to fight those ships efficiently could not be berthed in the ships.

I wish to emphasize that. [Continuing reading:]

They were not big enough to hold the crews that we needed to fight the guns in the ship.

In the course of two years, now, mind you, here were Admiral Plunkett and the other admirals also. [Continuing reading:]

As the result of Admiral Mayo's efforts, in which I heartily concurred, we finally arrived, in the course of two years, at what was the correct number of men and officers in order to man our ships which were then in commission so that they would be efficient in battle. The numbers which we arrived at were far in excess of the numbers which were contemplated in the original design of the ships.

I might say, as bearing directly on this, and also having an influence on the number of these men, that in 1915 we woke up to the fact that we had built a number of very excellent ships but we had not found out how to fight them. Before 1915 there was a fire-control board ordered, which went right into the question, not of using the guns of the ship one at a time, but how to use all the guns at the same time so as to bring the greatest volume of fire to bear upon the enemy; and it was the report of that board that pretty nearly turned the Navy upside down and was the first step in the direction of showing us what we actually needed in the way of officers and men on our ships in order to fight them in battle and to bring all their offensive and defensive weapons into action at the same time. Naturally, the money was asked for at once, but it takes time to produce the instruments that were required to be installed in those ships, and also naturally our latest ships were the first ones to receive them.

But never in the history of the Navy has there been anything more intensive than the gunnery training of our fleet which took place in 1916 and 1917 and 1918.

There was never anything like it. [Continuing reading:]

The result of that was that when the war broke out, although we were still undermanned, the gunnery efficiency of the ships that were in commission was higher than it ever had been in my recollection of the Navy. As a matter of fact, we had just one battleship, the *Wyoming*, fire in practice at nearly 20,000 yards, the longest range that has ever been fired by the service, and she made the phenomenal score of 20 per cent of hits under battle conditions.

It was also in connection with this situation that Admiral Rodman in a report dated December 15, 1917, stated as follows:

The division commander is deeply impressed with the inconsideration that is shown the enlisted personnel, on these ships in particular and all of our ships in general, in reference to the inadequacy and crowded condition of their sleeping and living spaces. The best and airiest space, such as the gun deck, is largely taken up with offices galore, workshops, laundries, provision store-rooms, washrooms, for all sorts of ratings, etc., while the men are packed like sardines in a tin, two and three deep at times, in close, poorly ventilated berth-deck compartments.

It seems that whenever some new office or space is thought to be needed that the airiest and best space on the gun deck is taken from the men, that the occupants may have the benefit of the light and air during the working hours of the day no matter how much it may encroach upon the small proportion now assigned to the crew, and cause just so many more additional men to find sleeping billets on the already overcrowded berth deck.

We are constantly discussing sanitation, disinfection, precautionary measures for preventing disease, etc., but to my mind we neglect the most important, namely, insuring sufficient and well-ventilated sleeping accommodations for the crew.

It should be remembered that for the last 10 months, since this division has been operating with the Grand Fleet, that in order to darken ships it is absolutely necessary to interfere with even the ordinary ventilating and fresh-air supply, thus adding to the unsatisfactory condition which previously existed.

In making a careful study of these ships I would strongly recommend structural changes, when the opportunity arrives, of (a) making an all but clean sweep of every office, storeroom, workroom, and utility now installed on the gun decks possible, placing them elsewhere, and turning it (the gun deck) into the main sleeping and messing space; (b) combining all offices, without an exception, into the same space or locality, segregating the commissioned from the enlisted personnel; (c) combining workshops into one general compartment.

at least those that are now in the gun deck; (d) install as many as possible of the utilities now on the gun deck elsewhere; (e) give sleeping space to the crew the first consideration; other installations to be considered secondary.

I believe that if these recommendations receive consideration and be carried out they will not only add to the health, happiness, and contentment of the crew, but will automatically add to the efficiency of the ships.

There is much wisdom in the above statement by Admiral Rodman, and his recommendations, in the main, when followed out, will work a great improvement.

And I may say that I have ordered Naval Construction and the Surgeon General of the Navy to follow out, as nearly as possible, the recommendations of Admiral Rodman that more space be given to the enlisted men, and that no crowding be permitted upon the ships.

COMPLEMENT OF BRITISH AND AMERICAN NAVAL SHIPS.

In the hearings before the House Naval Affairs Committee in 1918-19, there was much discussion as to the complement for ships of the Navy. The Acting Chief of the Bureau of Navigation, Capt. Laning, in making his recommendations for personnel, increased the number of men on each ship over the number that some members of the committee thought the ships required. I agreed with the House committee that the complement suggested was too high. In that hearing the question of the relative number of men in the United States Navy and in the British navy was touched upon. I furnished the committee the complement of ships of both navies, those of the British battleships for September, 1918, a long time after the battle of Jutland and just before the war closed. It is as follows.

You will find, Mr. Chairman, in that table that the numbers of officers and men on the British ships are not very far from the numbers of the complements fixed for our dreadnaughts when they were built. The table follows:

Complements of British battleships corrected to September 30, 1918.

Battleships.	Completion.	Displacement.	Officers and men.
Royal Sovereign.....	Apr. 29, 1915	25,750	942
Royal Oak.....	Nov. 17, 1914	25,750	977
Revenge ¹	May 29, 1915	25,750	970
Resolution.....	Jan. 14, 1915	25,750	937
Ramillies.....	Sept. 12, 1916	25,750	937
Canada (late Almirante I atorre).....	Nov. 27, 1913	28,000	1,176
Malaya.....	Mar. 18, 1915	27,500	955
Vallant.....	Nov. 4, 1914	27,500	957
Barham ¹	Dec. 31, 1914	27,500	965
Queen Elizabeth ¹	Oct. 16, 1913	27,500	1,066
Warspite.....	Nov. 26, 1913	27,500	957
Erin (late Reshadieh).....	Sept. 3, 1913	23,000	1,130
Agincourt (late Osman I).....	Jan. 22, 1913	27,500	1,267
Benbow.....	Nov. 12, 1913	25,000	965
Emperor of India ¹	Nov. 27, 1913	25,000	995
Marlborough ¹	Oct. 24, 1912	25,000	1,085
Iron Duke.....	Oct. 12, 1912	25,000	955
Ajax.....	Mar. 21, 1912	23,000	915
Centurion.....	Nov. 18, 1911	23,000	812
King George V ¹	Oct. 9, 1911	23,000	849

¹ Flagship.

A comparison of the complements of ships of equal size and fighting power will show that the Navy of our country has a larger complement than the British ships. For example, the *Royal Sovereign*, with a displacement of 25,750 tons, has 942 officers and men. The *Wyoming*, with a displacement of 26,000, had a complement of 915 in 1912. The fleet board in 1915 said the complement should be 1,200, and the Acting Chief of the Bureau of Navigation in 1918 said it should be 1,460, an increase of 545 men on one ship.

In the hearing Representative Oliver said:

I would like to call your attention to a statement made some time ago by Admiral Sims to the committee, where, I think, he expressed the opinion that the complement of some of our ships should be reduced.

That was in 1914 or 1915. At that time the complement, for example, of the *New York* was 902. The fleet board reported in 1915 that it should be 1,094, and the Acting Chief of the Bureau of Navigation, Capt. Laning, in December, 1918, said it should be 1,444. The ship had grown no larger, and yet in these few years it was proposed to increase the number of men necessary to man it from 902 to 1,444. And according to Admiral Rodman there were not sleeping places on the ship for the number of men recommended by Capt. Laning, and it was dangerous to health, and the sanitation was necessarily bad.

The CHAIRMAN. When was the *New York* put in commission?

Secretary DANIELS. About 1910, I guess. I should say that it was about that time. I will get the exact date.

The CHAIRMAN. It is not of any particular importance.

Secretary DANIELS. I should guess that it was between 1910 and 1912. It is important, and I will put it in.

These instances and opinions are cited to show that no naval expert opinion is infallible and that it changes from year to year, and sometimes rather startlingly.

ADMIRAL BLUE'S GREAT WORK AS CHIEF OF THE BUREAU OF NAVIGATION.

During this hearing much has been said about the number of men authorized in the naval bill of 1914-15, and an attempt has been made to show that fewer men were requested for the complement of the ships than the fixed complement settled upon when the ships were constructed. Two or three officers, not well informed as to his attitude and great service, have criticized the actions of Rear Admiral Victor Blue, then Chief of the Bureau of Navigation. The fact is that the number of men estimated for each ship by him was the exact number which the ships had been operating from their construction, fixed long before I became Secretary of the Navy, and before Admiral Blue became Chief of the Bureau of Navigation. His predecessors estimated the complement of the ships when they were built, and he truly says, "These complements had stood the tests of actual service."

In this connection I wish to say what every Member of Congress knows: That the chief credit due to any naval officer for the great increase in the Navy personnel and helpful personnel legislation is due to the wise, sensible naval statesmanship of Admiral Blue while he was the Chief of the Bureau of Navigation. Some officers,

with short memories, forget the lasting debt the Navy and the country owe to Victor Blue. When he became chief of the bureau it had been impossible to secure the authorized enlistment of men for the Navy; we had no Naval Reserve and no provision for it; the Navy had no admiral or vice admiral, except Admiral George Dewey, who was voted the high rank for life for distinguished services and notable victory at Manila; there was no Naval Operations office; no fixed percentage of officers to the authorized strength of the Navy; there had been no addition to the number of chaplains since 1842; no provision for enough midshipmen to even adequately provide trained officers for the Navy of 50,000 men.

The Naval Reserve legislation, which saved us in the World War, was originally drafted by Admiral Blue in 1914, and its improvement as incorporated in the act of 1916 was prepared by him. The same thing is true of legislation for admiral and vice admiral, fixed percentage of officers, and he had the pleasure and privilege of seeing the authorized naval strength doubled during his incumbency in office. He had the confidence of the Naval Affairs Committee to the highest degree, and the personnel legislation in the act of 1916, unprecedented in number and wise provisions, which he recommended was enacted before he went to sea. It is true, as he says in his statement already placed in the record, that at great sacrifice he surrendered his desire to go to sea to remain in Washington to cooperate with the Secretary and the Naval Affairs Committee to perfect that great measure, incomparably the most constructive and greatest naval bill that Congress has ever enacted. Its provisions, drawn on preparations for war, stood the test of the great expansion, and little additional legislation was needed when the emergency, which had been foreseen by all of us, arrived. The Bureau of Navigation from August 29, 1916, had its sailing chart, largely prepared by Admiral Blue, and needed only to navigate in the channel marked out by Admiral Blue with a foresight that entitles him to the gratitude of the service and the country.

Admiral Blue has written to the committee and his statement, plain and illuminating, already inserted in the record, is complete refutation of the mistakes and misleading statements you have heard. Admiral Blue rendered distinguished service in the Spanish-American War for which he was highly commended and for which Congress gave him promotion by additional number in his grade. The following statement of his naval services, upon his appointment as Chief of the Bureau of Navigation, was published in the papers in April, 1913. It was very distinguished service, for which he was promoted. I will not read that.

(The matter referred to is here printed in the record as follows:)

The Secretary of the Navy to-day announced the resignation of Rear Admiral Philip Andrews as Chief of the Bureau of Navigation and the appointment of Commander Victor Blue to that office. Commander Blue had long been known to the country at large as a naval officer of the highest merit. He is best known throughout the world for the conspicuous part he placed in locating Cervera's fleet at Santiago during the war with Spain under the most hazardous circumstances. The two meteoric exploits of the war with Spain was Hobson's bottling up the Spanish fleet with the *Merrimac* and Blue's daring reconnoitering tours around Santiago to locate the Spanish fleet and ascertain information of inestimable value to the blockading American forces. While the whole world applauded, the Navy also fully recognized the value of Lieut. Blue's work. In

the Naval Register his name appears in italics with the notation that he was "advanced for extraordinary heroism during the War with Spain."

The Navy Department on June 13, 1898, received the following cablegram from Rear Admiral W. T. Sampson, commander in chief of the North Atlantic Station:

"Lieut. Blue just returned after detour of 70 statute miles to observe in the harbor Santiago de Cuba. He reports the Spanish fleet all there."

Secretary of the Navy Long in writing officially to Lieut. Blue speaks as follows: "The department realizes this simple cablegram is evidence that efforts in making this detour into the heart of the enemy's country, by which you ascertained information very much desired, must have been attended with great risk to your personal safety, and that you possessed the coolness, nerve, and bravery requisite to perform such duty under trying circumstances." The Secretary adds in the course of his letter that "the department takes much pleasure in highly commending you for this service," and considers it "a most favorable augury for your future career in the service already distinguished by the personal heroism of its members."

On June 27, 1898, Rear Admiral Sampson recommended to the Secretary for consideration the excellent conduct of Lieut. Victor Blue for having undertaken twice to locate the position of the Spanish fleet, on the first occasion traveling over a distance of 73 miles and on the second a distance of 60 miles, mostly through territory occupied by the entrenchment of the Spanish Army. The admiral recommended his promotion, and he was promoted.

In commending Lieut. Blue's exploit Lieut. Commander Delehanty on the *Suwanee* speaks of Lieut. Blue's report as a "simple, modest statement of his trip and results," but invites attention "to the perilous nature of the trip and the prompt and satisfactory manner in which it was performed."

Commander Delehanty in a report dated July 1, 1898, describes at some length the knocking down of the flag on the fort at Agnuderres and in the course of his report says: "We were at a distance of 1,300 yards, using this range and a 4-inch gun. Lieut. Blue sighted the gun and fired the three shots; the first rent the flag, the second struck near the base of the staff, inclining it about 20 degrees, from the vertical, the third shot tore away the flag and staff."

Lieut. Blue was also recommended for promotion by Capt. Goodrich, commanding the gunboat flotilla, for his conspicuous gallantry.

As a commander, Blue commanded the U. S. S. *Yorktown* on the Pacific station and followed that with a further tour at sea as chief of staff of the Pacific Fleet. On the completion of this service he was assigned to duty on the General Board.

He was executive officer of the *Suwanee* during the war and also commanded the Spanish gunboat *Alvarado*, which was taken immediately after the surrender of Santiago.

Commander Blue as Chief of the Bureau of Navigation will be charged with the general assignment of enlisted men and of officers not above the grade of commander. It is the Secretary's policy that an officer of the rank of commander shall not have the assignment of rear admirals and captains who are senior to him and he has issued instructions that he himself will handle the assignments to duty of these two grades after hearing the recommendations presented by his full council of aids.

Since coming into office the Secretary has received many reports showing that there is some dissatisfaction among the enlisted and commissioned personnel of the Navy, and he has found Commander Blue thoroughly in accord with his ideas as to the necessary steps that should be taken to advance the interests of the enlisted men and of the seagoing officers, thus increasing their contentment and adding to the efficiency of the fleet.

After his terms as Chief of the Bureau of Navigation, where he planned and secured nearly all the personnel legislation which enabled the Navy Department to provide officers and men for the ships when war was declared, he became captain of the dreadnaught *Texas*, which, under his captainship, held the highest record for efficiency of any dreadnaught in the Navy. That ship was in the battleship squadron in the North Sea during the war, under the command of Admiral Rodman.

I have here copies of the letters addressed to the chairman of this committee, Senator Hale, in regard to the testimony of Admiral McKean.

The CHAIRMAN. You do not care to have those letters printed again? They are already in the record.

Secretary DANIELS. Yes; they are already in the record. They need not be printed here.

THE NAVAL RESERVE—STRICT ORDERS GIVEN WHICH PREVENTED THE THREATENED ABUSE OF WHOLESALE COMMISSIONS TO MEN NOT QUALIFIED.

Secretary DANIELS. I have often paid tribute to the splendid body of young men who served in the Naval Reserve. They had enthusiasm, born of high patriotism, zeal, and ambition, and in a remarkably short time many of them learned so rapidly that they deserved the fine things said about them by the Regulars. It is hard to know how we would have managed to furnish crews to the troop transports and ships for carrying ammunition and supplies and performed the other varied important, not a few of them new, duties, unless legislation had been enacted prior to the war which gave power to enroll any necessary number of men for the big task, assigned to the Navy.

Let me review the beginning of the Naval Reserve and show the foresight which made it an effective agency when the World War made unprecedented and unexpected demands upon the American Navy. I had not been Secretary of the Navy many weeks before the question of encouragement of the Naval Militia received consideration, and I appointed a board of its officers to draft the provisions which added to the value of the Naval Militia. Just here let me say how much the Navy owes to the members of the Naval Militia when we went to war. There were only about 11,000 or 12,000 men in the Naval Militia, but they were mobilized at once and furnished the best officers who were immediately available except our own noncommissioned officers who were promoted. Not a few of them were given responsible duties and they fitted into the organization so well that their good work more than justified the faith I had in them when, in 1913, I gave hearty and active cooperation to this body trained in peace for service in war.

There was no provision for the organization of the Naval Reserve when I became Secretary of the Navy in 1913. After securing legislation to strengthen the Naval Militia and procuring better training for them, the department turned its attention toward legislation providing a naval reserve. As far back as the naval appropriation act of March 3, 1915, upon the recommendation of the Secretary of the Navy, Congress enacted legislation creating a Naval Reserve, and in the act of August 29, 1916, the law was broadened and extended along lines first drafted by Admiral Victor Blue, the Chief of the Bureau of Navigation. By reason of this legislation the Naval Reserve was an instrument ready to be used even before we entered the war; but it was not until the regular quota was filled and the need for men was pressing as we entered the war that it became a large and powerful agency. Indeed, when we entered the

war in April, 1917, our Naval Reserve was small and was composed largely of the Naval Militia or National Guard Volunteers, numbering about 12,000.

Under date of July 30, 1915, in response to my oral order for recommendation for war needs, the General Board stated that

Upon outbreak of war the personnel of the Navy must be greatly extended to provide for aviation, coast defense districts, auxiliary duties of all kinds, and a reserve of men under training to replace casualties.

Admiral Blue, Chief of the Bureau of Navigation, in his annual report in the fall of 1915, stressed the need for changes and additions to the Naval Reserve law, and under date of January 13, 1916, I addressed a letter to the chairman of the Naval Committees of the House and Senate, inclosing a draft of a bill for the establishment of a Naval Reserve, from which the following is taken. I will not read that, but simply have it inserted.

(The matter referred to is here printed in the record as follows:)

I am inclosing herewith a draft of a bill for the establishment of a naval reserve, the careful consideration of which by your committee is recommended.

It is more general in its application than the reserve established by the naval appropriation bill approved March 3, 1915, and includes various classes of persons who are capable of rendering efficient service in the Navy in time of war. * * *

Prior to the present war in Europe, England had in her regular navy 45 enlisted men for each 1,000 tons of ships. Germany had 51, France 67, Japan 71, and the United States 52.

The United States, therefore, has on a peac basis about the same number of enlisted men per 1,000 tons as Germany, somewhat more than England, and considerably less than France and Japan.

England maintains a reserve force equal to 45 per cent of her active force. Germany 104 per cent, France 149 per cent, and Japan 55 per cent of their active forces, respectively. The United States has a reserve force, including the Naval Militia, equal to only 12 per cent of her active force.

It is, therefore, seen that all great naval powers maintain reserve force to fill the complements of their fighting ships in time of war, and to supply personnel for auxiliary vessels taken over from the merchant marine. Otherwise the cost of the regular establishment would be a greater burden for the taxpayers than it is.

* * * * *

An adequate naval reserve force is a necessity for national defense. It is an economy in the Naval Establishment as an item in the cost of preparedness, and I can not too strongly recommend the careful consideration of the subject by your committee.

Secretary DANIELS. The great value of the Naval Reserve in war, pointed out in January, 1916, "it is necessary for national defense," was fully realized when war came. Before the armistice was signed we had enrolled 306,728 men and 20,705 officers in the Naval Reserve. Most of them had no previous naval training, though some of them had technical knowledge or accounting experience which were needed and not a few had had some experience at sea. However, all of these were not called into service during the war. I wish to emphasize this:

While a large Naval Reserve before we entered the war was the goal to which I had been working for years, the policy of the department was to concentrate upon securing the full quota of regulars authorized by law before pressing for enlistment in the Naval Reserve. The reason for this was plain. The regulars were actually

in the service and could be trained and sent anywhere. The law governing the reserve force was in these words:

The Naval Reserve force will be composed of citizens of the United States who obligate themselves to serve in the Navy in time of war or during a time of national emergency, declared by the President.

I remember the first suggestion of a draft of that legislation. We provided that the reserves should "serve in time of war or during the existence of a national emergency" and some wise member of the Naval Affairs Committee raised the question that a "national emergency" should be strictly defined, because the reserves, while ready to come into the Navy in war or emergency, did not wish to subject themselves to come in except in some extraordinary emergency. In order to meet this view it was decided to provide that they be called into active service only in war or when the President "declared" a national emergency. This was emphasized in the law by the following paragraph:

Members of the Naval Reserve force may be ordered into active service in the Navy by the President in time of war or when, in his opinion, a national emergency exists.

The Naval Reserve has established six classes in which officers and men could be enrolled for different kinds of duty as follows: Class 1. Fleet Naval Reserve; class 2, the Naval Reserve; class 3, Naval Auxiliary Reserve; class 4, Naval Coast Defense Reserve; class 5, Naval Reserve Flying Corps; class 6, Volunteer Naval Reserve.

The qualifications necessary for enrollment in each class is as follows:

Class 1: Must be an ex-officer or enlisted man of the United States Navy.

Class 2: Under the original act of August 29, 1916, class 2 was limited to those engaged in the seagoing profession who enrolled for general service. This was changed by the act of July 1, 1918, so that any citizen of the United States could be enrolled in this class who was qualified for the duties of their rank or rating on combatant ships of the Navy.

Class 3: This is the merchant marine class. All officers and men engaged in the seagoing profession in the merchant marine are eligible for this class.

Class 4: Any citizen of the United States may be enrolled in this class, regardless of any previous seagoing or ship experience. Unless enrolled for general service or for service or transfer to another class they are not liable for duty outside of a naval district or on district vessels.

Class 5: Is confined to those qualified for duties in connection with aviation.

Class 6: There is no restriction on the membership of this class by law, but restrictions may be made by regulation of the Secretary of the Navy. They take no training in time of peace and draw no pay.

Class 4, known as "Naval Coast Defense Reserve," did not require skill and experience in seamanship, and any citizen was eligible to enroll in this class "capable of performing special useful service in the Navy or in connection with the Navy in defense of the coast," but they could not be sent to the general service in the Navy without

their consent. This applied alike to officers and men. It made service so limited that large enrollment of reserves of class 4 was not desired until after the regular quota had been filled. The law as to commissioning officers in class 4 was the same as in other classes of reserves, for it required—and I beg to call special attention to that statement—that—

No person shall be appointed or commissioned as an officer in any class of the Naval Reserve force, or promoted to a higher rank therein, unless he shall be examined and recommended for such appointment, commission, or promotion by a board of three naval officers, none below the rank of lieutenant commander.

The CHAIRMAN. Does this same law as to class 4 as to officers apply to enlisted men; that is, that they were not liable for duty outside of the naval district?

Secretary DANIELS. Yes; the same applied.

The law as to class 4 was very broad, and the very liberality of its provisions imposed a special duty upon its administrators to be careful to carry it out in its spirit, and to secure only those who could render "special useful service in the Navy or in connection with the Navy in defense of the coast." It was never intended that class 4 should be used to enroll men to become clerks and perform other strictly nontechnical shore duties. The terms of the law limit those enrolling to serve the Navy or "in defense of the coast and only in war or in emergencies." The large latitude given in enrolling men and officers in the reserve of class 4 made it easy, unless administered most conscientiously, for it to be abused. The men and officers enrolled in class 4 could not be used for general service at sea, but were restricted to duty in naval districts, though they could be used for naval district vessels also. But they could not be sent abroad. It is important to bear in mind that they could not be sent to sea for general use in the Navy, and, therefore I directed that no special effort be made to secure enrollments in class 4 until the quota of regulars authorized by law had been filled.

On April 1, 1917, there were 3,345 men enrolled in class 4, out of a total of 8,079 in the reserve force; nearly half. During the month of April there were 16,371 enrolled in the various classes of the reserve force. Of this number there were 11,041 enrolled in class 4, and none of them could be sent to sea on regular service. During the month of May there were 13,614 Naval Reserves enrolled. Of this number 10,830 were in class 4. On June 1, 1917, out of a total of 38,064 men enrolled in the reserve force, there were 25,216 in class 4.

In other words—and this is very important to get this in the record—nearly three-fourths of the Naval Reserves enrolled this date—in other words, nearly three-fourths of the Navy—could only be used for coast defense purposes and could not be sent to sea for general service in the Navy. I must say, Mr. Chairman, otherwise a wrong impression would be conveyed, that very many young men who enlisted in class 4 did so only because they wished to come in only "for the war" and not because they wished to limit their service to coast defense. There were also on this date 1,259 men who were enrolled in class 4 for training for duty in other classes, the enrollment under these conditions having been done at the volition of the men enrolled and these men could be used for duty at sea under the stipulated condition of training for the other classes. This

number, however, was extremely small compared to the large number of 25,216 which could not be used for general service. On this date, June 1, 1917, the allowed strength of the Regular Navy was 162,466 and there were enlisted in the Regular Navy only 109,010. Our greatest need was to press for regulars rather than reserves for limited service.

The conditions mentioned above also applied to the officers enrolling in class 4 of the Naval Reserve, except in my opinion they were even more unsatisfactory than those in regard to the men because I found that a large number of officers were being commissioned direct from civil life who had no seagoing or ship experience or any expert knowledge or business education.

In the month of March, out of a total of 1,212 reserve officers enrolled 969 were in class 4. For the month of April out of a total of 1,632 there were 1,281 in class 4. I was surprised, I may say I was shocked, when I learned that the greater number of these officers were being enrolled for line duties, about which most of them knew little or nothing, and not for some technical duty in the Supply Corps or other staff corps. For instance, for the month of March officers in class 4 were enrolled as follows:

For the line-----	749
Medical Corps-----	76
Supply Corps-----	128
Other staff corps-----	20

For the month of April:

Line-----	658
Medical Corps-----	356
Supply Corps-----	85
Other staff corps-----	16

I learned also that many of these men, who had been enrolled as line officers in class 4, not only had no qualifications as naval line officers but they had been commissioned without any examination that tested their fitness to be made line officers, as the law required. My deep interest in the reserves, my faith in the value of their services, and my high conception of the qualities a man should possess before being given a commission in the line, impelled me to give directions to the Bureau of Navigation not to give commissions except to men of demonstrated fitness. When I learned that 1,407 officers had been commissioned in the line in class 4, in March and April, and none of them could be ordered to general sea duty, I immediately called a halt in the wholesale giving of naval commissions in the line. Indeed, earlier in April, when it came to my attention that men were being enrolled as officers in class 4 and assigned to desk duty who were neither technicians nor accountants, I directed the Chief of the Bureau of Navigation to send this telegram to all naval districts, of which this sent to the commandant of the second naval district is a copy:

APRIL 10, 1917.

COMMANDANT SECOND NAVAL DISTRICT:

Suspend enrollment of officers in class 4 until further orders. 10310.

BUNAV.

That telegram was not ordered to be sent until it was necessary to stop the abuse of the law authorizing the enrollment of officers in the

Naval Reserve, class 4, which threatened to become a scandal. By reason of my action the number of officers enrolled in class 4 in the line was reduced from 658 in April to 107 in May. After this order was issued the enrollment of men in class 4 fell from 10,830 in May to 5,211 in June and went as low as 1,419 in September. On June 1 I directed that all who enrolled in class 4 should volunteer for general service. However, the Bureau of Navigation continued to permit the enrollment of some men and officers in class 4, who had not the requisite qualifications and who had passed no competent examination. Some of those commissioned officers knew nothing at all of the duties of a line officer in the Navy and should have been required to enlist as seamen and obtain commissions by showing proficiency in training or in service afloat. This was done at a later date by my direction, and greatly to the good of the Navy and the reserves who were in class 4.

During those early months there was a continuous and persistent insistence from many quarters that commissions be given to young men in the Navy without the requirement of first serving apprenticeship as seamen. This insistence resulted too often in commissions being given to young men who lacked the training to command others. On May 1, 1917, there were 2,359 officers enrolled in class 4 (not one of whom could be sent to sea for general service), divided as follows:

Afloat at sea.....	180
Afloat on naval district vessels.....	127
Performing administrative duties on shore.....	1,230
Total on active duty May 1, 1917.....	1,537
Enrolled but not on duty as officers.....	2,859

It will thus be seen that the Bureau of Navigation and the district commandants had enrolled 822 officers, who had not been called to duty and 1,537 on duty, 1,230 of whom were performing administrative duties on shore. Most of them had been commissioned without any examination which tested their fitness, and except in the positions calling for experts and accountants, many of them without the proper qualifications for officers in the Navy. And none of these officers could be sent to sea for general service. The information came to me from Boston, from New York, from Philadelphia, from Norfolk, from Washington and their districts, and it was becoming common gossip that officers were being made "while you wait," and that young men with influence could get a commission while young men without influence had to enlist as seamen. My office was thronged with men asking commissions for young men of military age who ought to have gone to recruiting offices instead of seeking commissions. About that time I recall that a Member of Congress earnestly appealed to me to give his secretary a commission. "What can he do?" I asked. "He is a good stenographer," he answered. "Tell him to go to the recruiting office and enroll as a yeoman," I replied, and declined to give him a commission though the Congressman was earnest in his appeal.

Some days later I met the Congressman on Pennsylvania Avenue, and he said: "You remember the young man I asked you to commission as an officer and you said it could not be done until after he had enlisted and has won it by service?" I told him I did.

"Well," he said, "the young man has his commission and is wearing the gold braid. Somebody can give commissions if the Secretary of the Navy has not the power."

How was it done? He had taken the young man into one of the naval districts and he had been enrolled as an officer. This was not an isolated case. There were doubtless a number of like cases where, in spite of the order of April 10, the enrollments of officers in class 4 continued, though in less numbers. As information to this effect came to me from various sources I saw that it was necessary to take vigorous steps to prevent further enrollment of officers in class 4 and directed the Chief of the Bureau of Navigation on June 30 to inform the commandants of naval districts that any authority to enroll officers in class 4 was revoked.

This order caused much consternation and some criticism of the Secretary of the Navy, and some of the district commandants came to Washington and urged me to restore to them the right to commission officers in class 4. I declined and informed them that too many commissions had already been given to men who lacked the necessary qualifications and that when any commandant wished a man particularly qualified, as ascertained by examination, who ought to be commissioned, he should send his recommendation to the department, and such recommendation would be promptly acted upon. Some of them objected that this would cause delay. I told them that they had free use of the telephone and telegraph and whenever they needed to have a qualified man commissioned there would be delay of only a few minutes. I pointed out to them, as I had repeatedly done to the Bureau of Navigation, that the Navy owed it to itself and to the capable men it had commissioned not to commission any except those who could demonstrate special fitness, and those who had enlisted in the ranks and were working and studying to win a commission.

In some districts, where commissions were passed out too freely, the duty was assigned to young officers, sometimes to Reserve officers with little naval training, and they were influenced more by obtaining immediate help in the district than by requiring standards that insured qualified officers. In some districts in the early days of the war it is a fact that clerical and drafting and mechanical employees in navy yards were given commissions in class 4, and they never changed the civilian work they had been doing for years. This caused great dissatisfaction with other civilian employees, who properly felt that they had as much right to commissions as their co-worker at an adjoining desk.

It was necessary, Mr. Chairman, therefore, for me to give peremptory orders to prevent a wholesale abuse of commissioning men as officers in class 4 who were assigned to no purely naval work and who were commissioned without any examination worthy of the name.

It is a proud record of the Navy that nearly all the Naval Reserve officers of class 4 made good, and most of them were worthy and when called upon qualified for general service. But if I had not taken a determined stand and given drastic orders, which alone prevented the large abuse of class 4 officers, there would have been a scandal which would have reflected not only upon the Navy but would have

reflected also upon many worthy and efficient men who received commissions in class 4. At one time there was talk that "Naval Reserve class 4 is the slacker's paradise." It was not true, but it was prevented only by plain and direct orders. Nearly all the officers and men in class 4 showed their patriotism and good stuff by volunteering for "general service" when the department pointed out that the only service that counted was to go anywhere at any time and do anything the Navy needed to do. I know these officers and men. I would say nothing to reflect upon them, because before my order was issued some were commissioned who had no knowledge that qualified them for commissions. Indeed, they appreciate that the course I pursued kept out of the Naval Reserve class 4 those who wished to make it a refuge for men who were not willing to serve where service was the hardest.

In his testimony, Capt. Palmer, who was Chief of the Bureau of Navigation during the War, in answer to a question told your committee that "in the latter part of January the Secretary stopped the enrollment of reserves." His memory plays him false. I did not order him to stop enrollment of reserves. The information came to me about that time that the Bureau of Navigation, before having enrolled its authorized quota of regulars (they were 20,000 short), was about to start a big drive for enrollment of reserves, most of whom would go into class 4, a class which could not be ordered to any service without their consent except in the limited service for which they had enrolled, and then only in war or in an emergency declared by the President. I directed Navigation to use all its energies to enlisting men in the Regular Navy until the quota was filled and not to inaugurate any vigorous campaign for reserves until the authorized strength of the Regular Navy had been enlisted.

In his testimony, Capt. Palmer says:

The idea was that the reserves would come in for the war period.

We were not then at war. That was January, 1917. We had not broken off relations with Germany, and it was not the policy of the Government to be making strenuous efforts to enroll reserves "for the war period," when neither the President had recommended nor Congress had declared war. To have carried on a whirlwind campaign for reserves "for the war period," as Capt. Palmer says the Bureau of Navigation wished to do three months before war was declared, would have been against public policy and was wholly unnecessary because we needed regulars then more than we needed reserves. That is the plain and simple explanation of my wise direction. I could not consistently have taken any other course. But no order, verbal or otherwise, was issued "not to enroll men in the reserves." In fact, actual enrollments in the Reserve Force went on in the orderly way, without the big propaganda and big organization planned for enrolling reserves before the quota of regulars had been secured, and Navigation enrolled them in accordance with the law. As full proof of this, I need only to state that enrollment of reserves in January were 32 officers and 324 men; the enrollments for February were 208 officers and 1,346 men; for March, 1,212 officers and 5,530 men; and for April, 1,632 officers and 16,371 men. I did not order enrollments stopped, and they were not stopped.

Making a mountain out of a mole hill is a small business in comparison to the attempt to charge me with procrastination because of my order to concentrate on Regulars and fill that quota first, before making a drive for reserves. In fact, my action in directing the Bureau of Navigation to press Regular enlistments of men who would go anywhere ordered in preference to a whirlwind campaign for reserves, most of whom enrolled at that time only for service in a district, proved of great value in securing first an increased Regular personnel when most needed. In his testimony before your committee, Capt. Palmer, while telling you that I ordered him to stop enrolling reserves at certain times—I have given you my reason for the sound policy adopted—in answer to a question as to my action with reference to pressing the enlistment of Regulars, said:

The Secretary backed it up. He liked to see numbers coming in, and he spoke about it and wrote about it many times. He wanted to see the enlisted men come in.

If he had gone into detail he would have added that I not only backed up the recruiting force and wished enlisted men to come in but that I directed the Bureau of Navigation to use all diligence in enlisting the number of men authorized by Congress.

Your committee may not fully understand the significance of my action. A man enrolled in the Regular service could be sent to Queenstown, to Brest, to China, to Gibraltar—anywhere the Secretary of the Navy directed. The reserves enrolled in class 4—for special limited service in a small area—would not be available for service until war or an emergency, and then only for service in the coast defense, while Regulars enrolled were immediately available for any service in any part of the world. We could not put the reserves of class 4 on a ship to go anywhere needed, and we could not call them in even for training until war or an emergency.

The reserves of class 4 enrolled only for duty in coast defense districts. For example, at that time if a man should enroll in class 4 in the Chicago district I could not order him to duty to go to New York and go across on a destroyer or any like service. I could not send him to duty outside of the coast defense districts. When that provision was incorporated in the law it was done to induce young men in times of peace to become reservists and take their training practically at home. Soon after war began I found it was not a workable reserve, and I later directed the Bureau of Navigation to take steps to have all in class 4 changed over to a class for Regular service anywhere or be denied promotion. Most of them, fine young fellows, gladly did this and not a few had previously voluntarily asked to leave the coast defense service and enlist for overseas or service anywhere.

Capt. Palmer told your committee that several times I directed him to stop enrollment of reserves during the war. He would have been strictly accurate if he had said I directed him to stop enrollment of officers in the Naval Reserve in class 4. I never ordered the discontinuance of enrollment of men in the Naval Reserve at any time during the war until the introduction of the selective draft. But I did give an imperative order to Navigation to discontinue the enrollment of officers in class 4, except by the department. Why? Because I learned that too large a number of youths had been enrolled as officers without examination or qualifications. It had gone

to such an extent as to threaten a public scandal. Let me repeat, for it is important: The enrolling officers in some districts, for example, had given commissions in the Naval Reserve to certain clerks and other employees in navy yards who continued to perform at their desks the same duties they had hitherto performed as civilians. With what results? Other like employees in navy yards, quite as patriotic and quite as efficient, said they had been discriminated against and that they had as much right to receive commissions as those favored with commissions.

And they were right. Worse than that! Not a few young men, who had never seen the sea, knew nothing about accounting, and had no technical experience of any kind whatever, had been commissioned as lieutenants and in other grades. Such wrong giving of commissions was not only illegal, but was wholly indefensible, and when it was called to my attention I directed the Bureau of Navigation to put an immediate stop to the practice which, if not stopped short, would justly bring commissions in the Naval Reserve class 4 into disrepute, and cause just criticism of the Navy for handing out commissions to those who had no qualifications for them.

That order brought down on my head the hostility of those seeking an easy entrance into the Navy with a commission, and of some officers who had been ladling them out. There were those who declared that my order was wrong and would retard the work of the Navy. Already commissions in the Naval Reserve had been cheapened by lax issues of commissions to men who ought to have been enlisted in the ranks and told that the only way to receive a commission was to earn it by service in lower grades. Most of the men commissioned were capable and fine and made excellent records after we trained them in schools and afloat. But it would have been better for most of them and for the Navy if their early training had been in the ranks and they had secured their promotion by demonstrating their capacity. Many were so promoted and their service in the ranks made them better officers. I am not, of course, speaking of those who had nautical experience, were accountants, doctors, or experts, but of youths just out of school, or office, or shop, who lacked the training or knowledge to fit them for receiving commissions.

It was plainly my duty to see to it that commissions should be confined only to those qualified and who had some special experience that fitted them for the task in hand. The order to which reference has been made stopped the flood of applicants who desired the honor of a commission without possessing the qualifications that should always be demanded before commissions are issued. It turns out, however, from testimony before your committee, that, in spite of my order, a number of such commissions were issued, but the order prevented the threatened scandal and, except where disobedience of the law and my order admitted a favored few, the officers who came into the Reserve were fit and qualified. The capable men who were making good records in the Navy, and that included most of them in class 4 as in other classes, were as jealous for the honor of the corps and for the exclusion of those not qualified as was the Secretary of the Navy. They knew and you know the terrible pressure from many sources, particularly in the early part of 1917, to open the floodgates for Naval Reserve commissions for youths who knew nothing that qualified them for receiving commissions. Later on, after the selective

draft had been introduced (it was introduced April 17, 1917, and passed the Congress May 18, 1917, and was signed by the President on the same day, neither the President nor the Navy Department delaying a minute in pressing measures to win the war), there came a greater rush for enrollment, particularly in class 4 in the Naval Reserves. Officers of the War Department and others pointed out that part of this rush was because men who up to that time had not enlisted in either branch of the service were rushing to enlist in class 4 of the Naval Reserve, and they said it threatened to become "the slacker's Paradise." At that time, having already more men in the Navy than we had training facilities, I ordered enrollments held up. Inasmuch as the President had urged the selective draft to be applied alike to Army and Navy, I felt that the Navy ought not to defeat that method of securing personnel by accepting, before that law went into effect, more men than the Navy could train, but to adopt the spirit of the selective draft even before it became a law. It was not a very pleasant duty to halt those who hurried to enlist at that time. Most of them were fine young fellows who became splendid fighters.

In the Bureau of Navigation there was hostility to including the Navy in the selective-draft act. They wished it to apply only to the Army, and as their wish could not prevail, they were anxious to enroll as reserves all who applied. We already had more men than we could house and train. My belief was that the selective draft was a thoroughly democratic measure, that young men who came into the service under that law were coming as patriots, and that no distinction should be made between them and those who had enlisted before that law was signed. I particularly thought it would be contrary to the spirit of that righteous law to overcrowd the Navy in order to enroll as reserves those who frankly said they wanted to come into the Navy as volunteers rather than to come in under the selective draft. The policy I pursued was the right policy, in accord with the spirit of the selective-draft law, and it was generally approved then and it will stand the test of time.

INCREASE OF OFFICERS IN THE NAVY SINCE 1913 AND PROMOTION OF MEN FROM THE RANKS.

The chief source now, and practically the only source before 1914, for securing officers for the Navy was from the graduates of the Naval Academy. It requires a four-year course at the Naval Academy before a commission as ensign can be won. Whatever lack of trained and experienced officers there was in 1917 was due to the fact that the number of appointments as midshipmen was too small prior to 1913. Every criticism you have heard of the lack of a sufficient number of efficient naval officers goes back to the policy pursued in securing adequate material in enough midshipmen at Annapolis prior to 1913. Officers of the line can be obtained in no other way except from the ranks, and until 1913 the number promoted from the ranks was negligible. The adoption of schools and encouragement for men in the ranks began in 1914, and the encouragement thus given increased the number of officers from the ranks, but still the officer strength depended chiefly upon the number of midshipmen at the Naval Academy.

The following shows the number of midshipmen at the Naval Academy from 1909 to 1919, inclusive:

Oct. 1, 1909-----	774	Oct. 1, 1915-----	918
Oct. 1, 1910-----	758	Oct. 1, 1916-----	1,231
Oct. 1, 1911-----	732	Oct. 1, 1917-----	1,435
Oct. 1, 1912-----	768	Oct. 1, 1918-----	2,120
Oct. 1, 1913-----	861	Oct. 1, 1919-----	2,086
Oct. 1, 1914-----	916		

It is not possible to give the number for 1920, inclusive, as no midshipmen have yet entered the Academy for this year.

The first piece of naval legislation enacted after I became Secretary of the Navy looked to officer material at the Naval Academy. The law authorizing each Congressman to appoint two midshipmen was to expire on the 30th day of June, 1913, and the law would revert to a single appointment for each Congressman thereafter. I wrote to the chairman of the Naval Affairs Committee, calling attention to the expiration of the law, pointed out how it would reduce the officer material, and requested the enactment of a law by which each Member of Congress could that year and succeeding years appoint two midshipmen. The following act was passed by Congress and approved by the President July 9:

That after June 13, 1913 and until June 30, 1919, there shall be allowed at the Naval Academy 2 midshipmen for each Senator, Representative, and Delegate in Congress, 1 for Porto Rico, 2 for the District of Columbia, and 10 appointed each year at large.

In the latter part of 1913 I made earnest recommendation to Congress to open the doors of the Naval Academy to capable and ambitious young men in the enlisted personnel. I showed that their practical training would be of immense advantage, and that an American Navy ought to give American opportunity to every enlisted man to enter the Academy and have equal chance with other youths to win a commission by training as a midshipman. It was a new idea and when presented to the House Committee on Naval Affairs met with approval. As a beginning the naval bill approved June 30, 1914, incorporated the recommendation in this language:

Hereafter, in addition to the appointments of midshipmen to the United States Naval Academy as now prescribed by law, the Secretary of the Navy is allowed 15 appointments annually from the enlisted men of the Navy, who are citizens of the United States, and not more than 20 years of age on the date of entrance to the Naval Academy, and who shall have served not less than 1 year as enlisted men on the date of entrance.

I should state that the bill, as it passed the House, authorized the appointment of 25, but when the bill reached the Senate there was opposition to the Americanized idea by a few Senators. In order to secure the immediate adoption of the principle and open the door to youths already in the service the smaller number of 15 was acquiesced in.

Feeling the need of training more and more officers, in the fall of 1915 I recommended that every Congressman be authorized to appoint 3 instead of 2 midshipmen, and the following act was approved by the President February 15, 1916:

That hereafter there shall be allowed at the United States Naval Academy 3 midshipmen for each Senator, Representative, and Delegate in Congress, 1 for Porto Rico, 2 for the District of Columbia, 10 appointed each year at

large, and 15 appointed annually from the enlisted men of the Navy as now authorized by law.

To still further provide for line officers in the naval bill approved August 29, 1916, the following provision was incorporated:

Hereafter, in addition to the appointment of midshipmen to the United States Naval Academy, as now prescribed by law, the President is hereby allowed 15 appointments annually instead of 10 as now prescribed by law, and the Secretary of the Navy is allowed 25 appointments annually instead of 15 as now prescribed by law, the latter to be appointed from the enlisted men of the Navy who are citizens of the United States, and not more than 20 years of age on the date of entrance to the Naval Academy, and who shall have served not less than 1 year as enlisted men on the date of entrance: *Provided*, That such appointments shall be made in the order of merit from candidates who have, in competition with each other, passed the mental examination now or hereafter required by law for entrance to the Naval Academy, and who passed the physical examinations required before entrance under existing laws.

The reports from Annapolis showed the wisdom of the appointment of midshipmen from the ranks, most of those making good in the real American way. Therefore, I recommended that 100 enlisted men be eligible annually for appointment as midshipmen, and Congress heartily cooperated and the authorization was contained in the following act approved March 4, 1917:

Hereafter, in addition to the appointment of midshipmen to the United States Naval Academy, as now prescribed by law, the Secretary of the Navy is allowed 100 appointments annually instead of 25, as now prescribed by law, to be appointed from the enlisted men of the Navy who are citizens of the United States, and not more than 20 years of age on the date of entrance to the Naval Academy, and who shall have served not less than one year as enlisted men on the date of entrance: *Provided*, That such appointments shall be made in the order of merit from candidates who have, in competition with each other, passed the mental examination now or hereafter required by law for entrance to the Naval Academy, and who passed the physical examination before entrance under existing laws.

As soon as war was declared Congress gave even more hearty cooperation, and the following act was approved April 25, 1917:

That, in addition to the number of midshipmen now authorized by law, there shall be appointed during the period from the date of passage of this act until September 1, 1918, one additional midshipman for each Senator, Representative, and Delegate in Congress. Nominations shall be made for these vacancies by the Senators, Representatives, and Delegates concerned for any regular or special examination that may be ordered before that date.

In the fall I recommended still further increase in the number of midshipmen, and this addition was authorized by Congress in the following act approved December 20, 1917:

That hereafter there shall be allowed at the United States Naval Academy 5 midshipmen for each Senator, Representative, and Delegate in Congress, 1 for Porto Rico, 2 for the District of Columbia, 15 appointed each year at large, and 100 appointed annually from enlisted men of the Navy, as now authorized by law.

Last year's naval bill increases the number of midshipmen allowed for the District of Columbia from two to three, and authorizes five midshipmen from Porto Rico, to be appointed on the nomination of the Resident Commissioner.

This provided that each Congressman should have the appointment of five midshipmen.

This record of preparedness, begun in May, 1913, to provide officer material and make practical men eligible for commissions is a

record that gave large increase in officers. If such provisions had been adopted prior to 1913, the number of trained officers when war was declared would have given the Navy an adequate number of experienced officers. Instead, prior to 1913, the number of midshipmen was too small to insure enough officers for the Navy, which was rapidly increased after 1913. As showing the previous short-sighted policy and how it adversely affected the Navy in the World War, in his testimony before your committee, Admiral McKean said:

The officer shortage dates back, in my opinion, to the act of August 5, 1882, which law provided for the honorable discharge of a large number of graduates of the classes of 1881, 1882, 1883, 1884, 1885, 1886, and 1887. At the same time and by the same law, through the elimination of cadet engineering appointments, the number of appointments to the Naval Academy were reduced by 25 each year. The total effect of this law in 35 years of its operation undoubtedly reduced the number of commissioned officers available at the time we entered the World War by about 750. The shortage of officers commenced to be felt in the service about 1893. It grew progressively worse, in spite of increases in appointments to the academy from time to time.

The responsibility upon the Secretary of the Navy and Congress is to make provision for the education and training of enough midshipmen to give sufficient officers for a growing Navy. It is the responsibility of naval officers to create, train, and graduate them. The following statement giving the number of graduates year by year since 1900 shows how the big increase after the measures enacted since 1913 by Congress detailed above were first put in operation:

1900-----	59	1905-----	114	1910-----	132
1901-----	67	1906-----	116	1911-----	194
1902-----	59	1907-----	210	1912-----	158
1903-----	49	1908-----	201		
1904-----	62	1909-----	175		

In 1913 I became Secretary.

1913-----	140	1916-----	178	1919-----	467
1914-----	154	1917-----	386		
1915-----	183	1918-----	199		

The best source for securing officers in addition to the graduates from the Naval Academy is, of course, from the naval ranks by the promotion of men who had made good through the various steps from enlisted men to noncommissioned officers. The opportunity for such recognition of merit in these practical and well-qualified men was not afforded before the war to the extent it should have been, and even after war was declared the prompt utilization in commissioned rank was postponed until legislation could be secured. But I directed the Bureau of Navigation, in issuing commissions, to give first consideration to capable men trained in the Navy, who had shown their capacity and stuff by winning promotion from seamen to the highest noncommissioned rank. The acid test of naval efficiency is actual war. Hundreds of men from the ranks were commissioned and they more than made good. Officers frequently told me of their delight in seeing men they had trained as seamen filling positions as captains on ships and demonstrating that they were worthy of the commissions they held. Some of them could not have passed an examination in higher mathematics, but their practical knowledge and experience more than compensated for any lack of book learning. A great man

once said to me: "It does not matter where a man is educated. The all-important thing is whether he is trained to be master of the job he undertakes." By that standard hundreds of men from the ranks measure in efficiency to graduates, and I have asked this Congress for authority to transfer them from temporary to permanent commissioned officers of the Navy, and I have found that this recommendation meets the approval of men who know much of naval needs.

The act of May 22, 1917, gave authority to promote capable enlisted men and others to temporary commissions in the regular Navy. We had no authority before that date to promote regularly enlisted men to commissions; except by passing the most rigorous examinations. Very few could qualify, because there were no schools to train them. After schools were started more of them could pass the examination, but the number was very small. I asked Congress for authority to promote enlisted men and warrant officers whose experience and ability justified their promotion. Congress gave the authority in the bill in these words:

Additional commissioned officers in the Navy and Marine Corps, based upon the temporary increase herein authorized in the number of enlisted men, shall be temporarily appointed by the President, in his discretion, with the advice and consent of the Senate, not above the grades and ranks of lieutenant in the line and staff of the Navy and major in the Marine Corps, the distribution in said grades and ranks to be made in accordance with the provisions of the act of August 29, 1916: *Provided*, That all temporary original appointments shall be made in the lowest commissioned grades of the line and staff of the Navy and Marine Corps, exclusive of commissioned warrant officers, and that there shall be no permanent or temporary appointments in or permanent or temporary promotions to any grade or rank above that of lieutenant in the Navy or major in the Marine Corps by reason of the temporary appointment of officers authorized by this act in excess of the total number of officers authorized by existing law or on account of the increase of enlisted men herein authorized: *Provided further*, That during the period of the present war the deficiency existing prior to the passage of this act in the total number of commissioned officers of the Navy and Marine Corps authorized by the act of August 29, 1916, may also be supplied by temporary appointments in the lowest grades and by temporary promotions to all other grades until a sufficient number of officers shall be available for regular appointment or promotion in accordance with existing law: *Provided further*, That temporary appointments as warrant officers of the Navy may be made by the Secretary of the Navy.

As soon as authority was obtained I directed the Bureau of Navigation, before giving commissions for line duty to any men in class 4 of the reserve, to promote the regular Navy men who were qualified. This direction was given as soon as the department had the authority, but was not carried out as promptly as I directed. Some noncommissioned officers protested to me that young and inexperienced men were given commissions over them, while they secured no commissions. I directed the Bureau of Navigation to give preference to fit men already in the Navy. The explanation of the delay given to me in the summer of 1917 was that the leading petty officers were so badly needed in the duty they were performing they could not be spared. That explanation did injustice to the experienced men, who were in many respects the backbone of the Navy, and I directed the Bureau of Navigation that it was our duty to give them the promotions, because they were far better qualified than men in class 4 of the reserve. As the result of this direction commissions were issued after July as follows:

Number of enlisted men of the Regular Navy promoted to temporary commissioned and warrant officers from May 22, 1917, to July 1, 1918, following the law of May 22, 1917.

During the month of—	To warrant officers.	To commissioned officers.	Total.
July, 1917.....	376		376
August, 1917.....	2		2
September, 1917.....	948		948
October, 1917.....			
November, 1917.....	124		124
December, 1917.....	1	197 82 32 59 25 26 30 29 17 21 36 30 27 28	180

Early in the war, when bright and patriotic young men of real ability were coming into the service it was seen that many of them could be made capable officers with a short course at Annapolis, and a Reserve Officers' School was opened at Annapolis. Admission was made by competitive examination so that the fittest only would be admitted to this school. The course was strenuous and the young men who matriculated learned with a rapidity that both surprised and gratified the naval authorities. The stimulus of war made these young men keen to learn and the zeal of officers and instructors gave them every facility and aid. This Reserve Officers' School was opened in the spring of 1917, shortly after the declaration of war, and it graduated 1,622 officers as ensigns, and not a few of them by display of high officers quality secured promotion and responsible assignment before the end of the war. It was not only to train officers for line duty that the Naval Academy made large contribution, for we established there also a Paymasters' School in the summer of 1917 and 400 young men of fine ability and useful service graduated.

The department established scores of other schools in different parts of the country, some of them connected with universities and colleges, where ambitious youths were so well trained that they were able to fit themselves for commissions. Indeed every training station in the Navy was a school and all of them trained enlisted and enrolled men who obtained commissions when they demonstrated their ability to command. It was in these practical ways that the Navy secured needed additional officers from civil life. To be sure, at first some were commissioned without such training, but all who had nautical,

technical, or accounting experience at once made good. Most of the others learned in time, but it would have been better for them if they had earned their commissions afloat or in training than to have entered the service as untrained officers.

In the reserve force I directed that a rule be established that so far as possible officers should be promoted from the enlisted men. Every practicable assistance was given to them to qualify and a large number of officers' training schools were established in various sections of the country, in addition to the biggest ones at Annapolis and Pelham Bay. In the reserve force there were commissioned about 22,000 line officers. Of this number about 13,800 were promoted from the enlisted men. In the case of medical officers, naval constructors, and civil engineers most of these officers came from civil life as they had already received special education in technical training in connection with their various professions.

SCHOOLS ENCOURAGED—THE POLICY OF EDUCATING OUR ENLISTED MEN AND RESERVES.

I had been in office only a short time when I became aware of the need of more systematic instruction of the youths who enlisted in the Navy. I believed then, and my conviction has increased every day since, that the Navy ought to provide for promotion to commissions to the brightest and most capable men in the enlisted force. Looking back over the previous four years, I found that only three men had been able to pass the examination for ensign. In the succeeding three years after I became Secretary of the Navy 13 were appointed. In order to give an open door for enlisted men to rise, I saw that we must establish schools in our training stations and on all ships, where every enlisted man would study arithmetic, history, geography, and other elementary branches, and be instructed also in technical and practical branches. In June, 1913, I visited the Naval War College and Training Station at Newport and made a thorough inspection. I found the War College had only about as many students as it had instructors, and that its advantages were not afforded to officers in the Navy. After conference in Newport with Admiral W. L. Rodgers, president of the War College, who had excellent ideas and wise views, and, upon my return to Washington, with Admiral Victor Blue, who was in accord with the policies of Admiral Rodgers, I announced that we would either close the college or make use of it.

Therefore more officers were ordered to Newport to take the course, and a moribund institution had the breath of life imparted to it. At the Newport Training Station I went thoroughly into the matter of training and teaching the apprentices and new recruits. I found the drills and calisthenics were carried on excellently, but there was no chance for youths with little education to study history or geography or other branches necessary as a foundation to enable them to make ready to pass examinations leading to a commission. Upon my return to Washington orders were given for the establishment of schools at training stations, and the first were started in Newport, July 1, 1913, under the intelligent and wise direction of the able officer, Capt. Roger Welles (now Admiral Welles, who is in charge of the new naval development at San Diego), who had been selected for

this new and important innovation. Soon after signal, radio, and hospital apprentice schools were established in the Newport Training Station, then at other training stations and on board all the ships. As a result of this instruction more and more young men qualified for ensign, and I secured from Congress authority first to appoint 15, then 25, and then 100 enlisted men annually as midshipmen to the Naval Academy. The policy of extending education to the enlisted personnel not only before the war gave the Navy better educated and better trained men and enabled some to win promotion, but when the stress of war came we found that those enlisted men who had taken advantage of these schools were better fitted for promotion, and hundreds of them were advanced to temporary commissions and more than made good in places of importance and responsibility. I am asking this Congress to provide that those who made good as temporary commissioned officers shall be given permanent appointments. The number promoted from the ranks as either warrant or commissioned officers was more than 11,000. As evidence of the wisdom of appointing enlisted men as midshipmen at Annapolis, I call your attention to the following extract from my annual report of the Secretary of the Navy for 1919:

FORMER ENLISTED MAN LED CLASS OF 1919.

The careers of the midshipmen who were appointed from the ranks has more than justified this departure from the old policy. The star graduate in the class of 1919 obtained his appointment by merit from the enlisted ranks. Other things being equal, such experience helps in the making of an officer. Fewer enlisted men have secured appointments as midshipmen than was expected because the stress and rigorous service of war left little or no time for study and preparation. Opportunity for instruction for ambitious youths in the service is now given to all who make application to stand the entrance examination.

ALL APPOINTMENTS WILL COME FROM THE RANKS.

In my annual report for 1917 I outlined what must, in my judgment, become the future American policy of securing and training naval officers. It is a departure from precedent, but the experience of war has more and more convinced me that the policy is a sound one, in keeping with American ideals. That plan was outlined as follows (pp. 18, 19, 20, Annual Report of the Secretary of the Navy, 1917):

SHOULD BEGIN AT THE BOTTOM.

The American ideal is that men shall obtain high station by beginning at the lowest rung in the ladder. They should obtain place and position by first mastering the primary duties. Is not this necessary to fit one for higher rank? Four years ago this principle impelled me to recommend to Congress that a certain number of enlisted men be appointed as midshipmen. Congress approved the idea. Though there had been no systematic instruction on the ships to prepare for the entrance examination, a number qualified. Their record at the Naval Academy has demonstrated the wisdom of the departure. So strong was the approval of this American plan of selection for appointment to Annapolis that at the last session of Congress authority was given to appoint 100 enlisted men annually. With the present educational advantages, which will be enlarged in peace times, this will give a large number of midshipmen the experience that every man should have before he undertakes command. The best training for command is to be subjected to the discipline an officer must enforce.

ALL APPOINTMENTS WILL COME BY PROMOTION.

The truth is that the day will come when all appointments to the Naval Academy will come by promotion from the enlisted personnel. Why not now? There are but two arguments against it, and only one of them is tenable. The first is that Congressmen would be slow to surrender their right of appointment. If, however, they are persuaded that the good of the naval service would be promoted by surrendering the right of appointment, it is not to be believed that Congress would hesitate to vote for the change. Indeed, not a few Congressmen have voluntarily surrendered the right to make their nominations by holding competitive examinations and naming the young man who stood the best examination. The only valid objection to naming the midshipmen by competition among the enlisted personnel is the fear that it would do away with the excellent plan by which every State and congressional district is now guaranteed equal representation in the Naval Academy. It would be a mistake if anything should change this system, which has made the Navy truly representative of the whole country in its commissioned personnel. To permit appointments without regard to place of residence might deny to the Navy as many naval officers from Iowa as from Massachusetts, for example, and experience has shown that young men from the interior, who never know what salt water is until they take their first Annapolis cruise, make equally as able officers as those from seacoast States. Is there not some practical way to retain the equal proportion to all the States and at the same time gain the immense advantage of opening a naval career alike to every ambitious young man in America? Of course such a plan can be formulated. The inability of many young men of real stuff, ambitious for a naval career, to secure a congressional appointment first induced me to urge Congress to give the Secretary of the Navy the right to appoint capable enlisted men to the Naval Academy. Now the number has been increased to 100, and, properly safeguarded by giving the appointments in the first instance to the States in proportion on their population, there is every reason why, in democratic America, an equal chance to become an admiral should not be within the reach of every ambitious youth.

WOULD INCREASE ENLISTMENT OF BEST YOUTHS.

If the only open door to instruction at the Academy was through regular enlistment and a year's service as a seaman, who doubts that the ranks of the enlisted personnel would be thronged by youths with love of the sea, ready and willing to make any sacrifice to earn a commission? The Navy would then truly be the highest example of the American doctrine that opportunity and promotion are reserved only for those who establish fitness for command. Fewer men would then enter the Naval Academy "to secure an education," and fewer still would "bilge." No man would pay the price of an appointment unless he loved the naval service. The naval officer to-day is a select man, trained, and ready, but if no man entered the Academy who had not been trained in the hard school of seafaring experience and by competition with 200,000 youths, would there not be born that enthusiasm for excellence that would insure a still higher standard of efficiency in the service?

STRONG REASONS FOR SCHOOLS FOR THE INSTRUCTION OF ALL ENLISTED MEN.

The demands of the war, of course, made impossible the instruction at training stations and on shipboard, but the policy is a fixed and settled one and is essential to the highest efficiency of the Navy. Since the war the system has been adopted on the best possible scale in the Marine Corps, and the following statement of the hearings of the Secretary of the Navy before the House Naval Affairs Committee tells how these schools are doing their important work, but embraces also the able argument in favor of schools for men in military service made by Gen. Lew Wallace in a letter to Hon.

John A. Bingham and presented to the Senate, April 11, 1866, by Senator Charles Sumner:

MARINE BARRACKS,
Quantico., Va., Friday, March 5, 1920.

Remarks made on the occasion of the visit of the Committee on Naval Affairs, House of Representatives, to Quantico:

REMARKS OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY.

Secretary DANIELS. Mr. Chairman and gentlemen, in the concluding days of the war I had the pleasure one night of attending a patriotic dinner in Baltimore, and I undertook to tell some of the things which the men of the Navy and Marine Corps had done to win the Great War, the victory of which we were soon to celebrate. When I had finished I think most of the audience were sure the marines had won the war, so much so that when Gen. Finney, the distinguished surgeon of Baltimore, who was a general in the Army, came to speak he referred to my tribute to the marines and to the sailors, and said that as he listened he wondered how he ever happened to get into the Army, which seemed to have played so small a part in the victory, though he believed from the figures there were about 4,000,000 men in the Army and only 75,000 marines and 500,000 sailors. He said that reminded him of an incident that happened when he was in France during the war. You know, he was one of the great surgeons, one of the great doctors who gave themselves to alleviating pain and giving inspiration not only to the men of our Army and the Marine Corps but to the men of the allied armies. He said that after every engagement the men who had been wounded were taken into the nearest hospital, whether British, French, or American, and after first aid had been given by the attending physician it was the habit of the American surgeons to visit the British and French hospitals to find any Americans who had been wounded, not only to cheer them by having one of their own countrymen there, but also to give them medical care and attention. He said he went into a French hospital and passed down the line of cots where most all of the wounded were Frenchmen. But he saw a young man, wounded, lying on a cot in the corner, looking very pale, and he walked up to the young man and touched him on the shoulder and asked, "Young man, aren't you an American?" And the young man answered, "No; I am a marine." [Laughter.]

That, I think, is the spirit that has made the Marine Corps the aristocrat of the military service. He feels that a Marine is something more than an American; that he fights for humanity; that he is ready to fight and to fight with courage and chivalry in the Army or Navy, with American troops or with French or British or Italian troops, or the troops of any country fighting for liberty.

It is a real delight for me to be here to-day and to have the honor of coming with the members of the naval affairs committee—our bosses, young gentlemen, and we look up to them as "Fathers in Israel," and they also furnish us our meal ticket. We naturally give them deference, because they are our superiors. But those of us who have been in touch with legislation concerning the marines and the Navy have learned that the members of the naval affairs committee do not enter upon their services in any purely perfunctory way, but that they have taken an interest in strengthening the Navy and the Marine Corps because they believe in it; they study it; they know it; and they are really comrades and friends and elder brothers. Therefore, we welcome them here as worthy to be enrolled in the corps. [Applause.]

I remember that during the first months I had the honor to be the Secretary of the Navy, the Secretary of War (then Judge Garrison), coming back from Panama after a brief visit of inspection at the canal, came into my office and said, in substance: "Daniels, I have learned something about what soldiers ought to do, and I want to tell you about it. Perhaps you already know it. I am just back from Panama, and I found a young marine officer in Panama conducting a school there. He was teaching the marines in camp there Spanish, and they were learning rapidly. It opened my eyes to what might be done, and I am going to advise Army officers to go down to Panama and learn from Gen. Smedley Butler how to teach men in the Army. [Applause.]

From that time on I have kept in touch with the spirit of the Marine Corps—the spirit, gentlemen, that is essential if our military service is to attract and

hold—and Chaplain Niver very truly emphasized the word "hold." We have permitted too many men to go out of the Navy and Marine Corps because they did not see in it opportunities for advancement to which every American youth is entitled. The world is learning, I tell you, that military service which does not send men back into civilian life better trained, better educated, and better fitted, is a failure and will not attract the finest young men in America.

The school organized here is the very basis, the very bottom, the very foundation of Americanism. That is the word in America to-day—Americanism. We have had too much un-Americanism in military affairs. The gulf between officer and man has been too wide, it has been too fixed, and only very extraordinary men have been able to span that gulf. Here, to-day, we have an object lesson of what must come in the Navy, the Marine Corps, and the Army, if our military establishment is to render the best service and be truly American. Here we have the Naval Affairs Committee, the general commandant of the Marine Corps, and other high officers of the corps, noncommissioned officers, and men sitting down at the same table as brothers and friends. [Applause.] When that is universal we shall have a spirit in our military service that will attract and hold the fittest young men in America, and we will not do it until that democratic spirit dominates and controls.

I had the pleasure a few days ago of being present at the Naval Affairs Committee hearing, when Gen. Lejeune was also present. Gen. Lejeune gave an illuminating statement of what was being done at Quantico, not only in the schools, but in the essence and spirit of a new idea, or rather the adaptation of an old idea to military instruction. I recalled to the committee that some years ago, when the Naval Affairs Committee and the Secretary of the Navy together had sensed what is being put in practice here, and there were not wanting then many men who said that all this school business in the Navy was out of place; that boys who came into the Marine Corps and the Navy to keep from going to school, and if you sent them to school they would desert. A writer of some reputation came to see me and said that all this school business to educate men in the service would unfit them for the job they had to perform; that it ought to be stopped before it ruined the Navy. He said, "You are not going to obtain men to coal a ship if you teach them history and grammar. You are not going to find men to do that kind of work if you educate them." I said to this gentleman, "Don't come and talk to me about that. If you don't believe that a man can coal a ship better or shoot better, or do any job, high or low, better for education, you go to Massachusetts and tear down the statue of Horace Mann and then come back and talk to me. No Americanism has the right to call itself by that proud name that does not seek to uplift, strengthen, and make more efficient every man in America. [Applause.]

With that spirit in our marine service, our naval service, and our Army, we shall before a great while attract into the service the flower of the country, and we will hold those of good judgment and ambition by putting before them the opportunity of the highest advancement. That day is past in America when preferment is exclusively in the grasp only of those who have been to Annapolis and West Point. We shall open the doors of promotion to men from the ranks. We have seen in historic wars that some of the greatest soldiers of natural genius and ability have made themselves superior to men of greater opportunities. We shall lift up always and never pull down. We shall open no doors of advancement to men who are not worthy and fit, who do not qualify themselves by study to make themselves the equal of those who have enjoyed the best advantages.

In the hearing before the Naval Affairs Committee the other day I made reference to a speech made in Congress in 1866 by Charles Sumner and the resolution he introduced in 1866, just after the Civil War, when the Army was finding it difficult, as now, to secure enlistments. He proposed in his resolution that at every Army post and garrison the officers should teach the men the rudiments of education, and accompanied that resolution by a letter of Gen. Lew Wallace, quite as distinguished an author as a fighting man—the ablest, strongest, and wisest document written on military instruction that I have read. I am going to send you, Gen. Butler and Gen. Lejeune, a copy of that, and I trust you will put it in the hands of these fine young marines, so that they may see that we are putting into practice the vision of Charles Sumner and Gen. Lew Wallace. [Applause.]

APRIL 11, 1866.

EDUCATION OF SOLDIERS.

Mr. SUMNER. I send a resolution to the Chair and ask for its adoption now:
Resolved, That the Committee on Military Affairs and the Militia be instructed to consider the expediency of providing a system of education for soldiers in the Army of the United States, so that the time not occupied in post or garrison duties may be employed in moral and intellectual improvement, to the end that the Army may be a nursery of officers and also of citizens.

There being no objection, the Senate proceeded to consider the resolution.

Mr. SUMNER. Before the vote is taken I wish to say that my attention has been called to this question by a letter which I saw in the papers this morning, from Gen. Lew Wallace, addressed to Hon. John A. Bingham, of the other House. It seems to me that this letter contains some important and practical suggestions, if they can be carried out. I think they must elevate the character of our Army and give to it truly the character of citizen soldiers. I was so much struck with them as I read the letter this morning that I have drawn up this resolution that I might bring the subject in the most formal way before the Committee on Military Affairs of this body.

The resolution was agreed to.

(The letter of Gen. Wallace, referred to by Senator Sumner, as follows:)

WASHINGTON CITY, *March 31, 1866.*

HON. JOHN A. BINGHAM.

DEAR SIR: I much regret that your kind note of the 29th instant, informing me of your arrangement for my appearance before your House Military Committee, to submit certain views touching the Army bills, was received too late to enable me to avail myself of it. It is not improbable, however, that the purpose will be as well subserved by putting them briefly on paper.

So far, not a suggestion has come to my notice touching "reconstruction" that is not more or less founded upon the loyalty, present or prospective, of the people of the South, of the value of which as a basis of security for the future we ought all by this time to be fully assured. In my judgment, our certain guaranties are in the Army and militia. When all things else fail, they are the last resort. As a consequence, their thorough organization is a vital part of the great work before this Congress.

It can scarcely be doubted that your committee, like that of the Senate, is alive to the importance of this subject; the speedy presentation of their respective bills is sufficient on the point. I hope, however, I will not be suspected of a want of respect if I hazard the opinion that both those bills fall far short of what the exigency demands. In what way they fall short can be best got at by stating their very manifest oversights; which are—

1. A neglect of the military lessons of the war.
2. The reorganization as proposed has no reference whatever to the loyalty, intelligence, and individual improvement of the rank and file.
3. The bills disclose no attempt to make the service honorable, so as to secure the enlistment of a class of citizens who from social position, employment, or education have a right to consider themselves respectable, and to whom for that reason you can address yourselves with the confident expectation of finding reliability under all circumstances. Pardon me if I go so far as to add that, from a study of the bills, it would really seem that in the judgment of your committee an Army of a hundred thousand rebels and aliens was as desirable and trustworthy as an Army of like strength composed of loyal citizens.

4. The bills are evidently framed upon the idea that there will be no difficulty in filling the ranks of the Army to any desired complement, whereas the reverse is the truth. The Regular Army now consists of 19 regiments of Infantry, 6 regiments of Cavalry, and 5 regiments of Artillery, which, with not more than one or two exceptions, if any, have not, as I am informed, been full even to the minimum. Further information on this subject authorizes me to say that at this date, so far are they from being full, some of them have scarcely enough enlisted men to constitute a battalion of a regiment; and this, too, while there are a million or more of young men in the country trained, veteranized, and habituated to the military life. It is a mistake to suppose that because the tables of the Secretary of War are groaning under applications for commissions, and because field officers of volunteers are to be found gladly

accepting second lieutenantcies in the Regular Establishment, therefore the thousands lately discharged are waiting eager to crowd the ranks of the proposed 55 new regiments. Indeed, so familiar am I with the volunteers as a class, now happily engaged in civil pursuits, that I risk little if anything in the broad assertion that you will have even less success in completing the additional regiments than your predecessors had in completing the old ones. Such a statement, in face of the common boast, or rather, in face of the absolute demonstration of the fact that ours is a martial people, is so extraordinary that nothing more can be required to establish the further fact that the present military system, as respects the rank and file, is founded upon egregious errors.

Passing from these oversights, I invite attention, in the next place, to some of the errors alluded to.

1. To find the true standard by which to gauge the rank and file of the Army you must look to the volunteers, whose superiority consisted chiefly in such qualities as intelligence, making each man quick to learn whatever is required; pride of character, holding him always to the line of duty; and citizenship, which invested him with a direct personal interest in every issue at stake. It is not saying too much that to these qualities of the volunteer private soldier, next to the blessing of Providence, we owe the life of our Government to-day; and that system, by whomsoever proposed, which falls now to incorporate them into the rank and file of the organized Regular Army, is unworthy the American people, at the same time that its adoption or continuance puts in needless hazard all we hope in the future. Your bill, like that of the Senate, is profoundly oblivious of the fact that one man can be a better soldier than another; literally, it has no standard; according to its philosophy the scarecrows whom Falstaff did not march through Coventry are as good as the immortals who followed Sherman to the sea.

2. The most certain and just method of filling the Army, and keeping it full, and at the same time of so composing it as to incorporate into its ranks the qualities mentioned, is not by draft or ordinary recruiting, but by adopting a system which will make the service what it ought to be to every private soldier, viz, a place of personal as well as public advantage and in the highest degree honorable. To this also your bill is oblivious.

Of these lessons, the first one ought to commend itself without a word of comment. As to the second, the question it presents is as to its practicability. At the risk of startling your committee, I will venture to assert that this question is beyond dispute. It has been tested long, fully, and successfully at West Point, and now the true form in which to put the subject is: What is the best way to extend the system in operation at that excellent academy to the rank and file of the whole Army? And if only to secure for it that gravity of consideration it is entitled to, I beg leave to express the opinion that Congress, requiring now a regular force of a hundred or more thousand men, instead of fifteen or twenty thousand, as formerly, has at last reached that point when it will be compelled to choose one of two alternatives: Either an adequate Army without West Point, or West Point without an adequate Army.

TO EXTEND THE SYSTEM AT WEST POINT TO THE WHOLE ARMY.

That system has three grand features: First, support of the cadet; second, education; third, graduation as officers of the Army.

As to the first feature, the Government already supports the soldier; there need be no additional cost on that account.

As to the second feature, the point is, simply, can the hours of service of a private soldier be so divided as to give him time for study and meditation without interference with his routine duty? Certainly, except when he is on the march. In post or garrison (his home in time of peace) duty seldom absorbs more than one-third of his hours not devoted to sleep. Hence the proverbial idleness of military life. My opinion is that the division of the cadet's time, with trifling modifications, is a complete illustration of what ought to be the division of time in the Army. It is not more difficult to study and play soldier than to study and perform a soldier's duty in fact. For those of your committee not familiar with the subject, I take the liberty of suggesting that you obtain from the superintendent at West Point a report showing the routine duty and instruction there, and from the commandant of some well-conducted and amply garrisoned post a report of the routine of duty for his enlisted men. Comparison of such data will convince any disinterested person that the difference between the routines amounts to this and no more: In the academy every hour is appropriated to duty and in-

struction, while at the posts one-third (most frequently not so much) of the working time of the soldier is occupied by duty and the rest given over to absolute and ruinous idleness. Keeping in mind that what is called duty in the service is performed by the cadet as part of his necessary instruction, by such a comparison you will come to understand, if you do not now, how simple the task will be to devise a system of instruction, blended with duty, which will have the effect to turn every post into an academy and convert every private soldier into a cadet.

Of the details of such a system it is not my purpose now to speak. A board of earnest officers, not idolatrously joined to the old régime, can easily reduce it to form. The branches of instruction will recommend themselves, while the officers and noncommissioned officers of each company should and can discharge the duties of professors and teachers.

As to the third feature. After having, in the way proposed, prepared the private soldier, there can be no sound objection to a law by which the officers of the Regular Army shall be drawn from the ranks exclusively, the commissions and warrants being held, for that purpose, as incentives to the ambition and toil of the enlisted men. The results of the proposed extension are self-apparent. By it you make the service honorable an advantageous to the private soldier, and by holding out inducements, such as education and commissions, you will attract to the ranks the flower of our youth, and in that way assure to the Government reliability under all circumstances. By it you will be able speedily to fill your proposed regiments. By it as a general result, practical military knowledge (not limited to a select caste, few in numbers, and not always faithful) will be scattered broadcast over the country. By it, and by no means least among the considerations, the discharged regular soldier will not be a vagrant or an idler whom society, from fear and distrust, thrusts back to his barracks; on the contrary, his honorable discharge will serve as a certificate of fitness and ability for any civil pursuit and make a welcome addition to every community. By it you will not only get better military service but, as an act of wisest statesmanship, you offer in a constitutional way the coveted opportunity for education to every lad in the land.

Upon your committee are several able and experienced soldiers to whom the mere suggestion of the subject is sufficient, and that is all I have sought to do in this letter.

If the committee think well of the idea and should so desire, I will take great pleasure in preparing a bill for their consideration and action.

Very respectfully, your friend,

LEW WALLACE.

The first school was established July 1, 1913, as heretofore stated, and they were put in operation elsewhere during the summer and fall, and later put into operation in the whole Navy through General Order No. 53, issued October 1, 1913, of which the following is a copy:

[General Order No. 53.]

NAVY DEPARTMENT,
Washington, D. C., October 1, 1913.

1. The Navy Department wishes to put into effective operation an educational and vocational training system for the benefit of the enlisted men of the Navy, both ashore and afloat. As a beginning such schools have already been inaugurated at the training stations, and steps are being taken toward their early establishment on board all naval vessels. In carrying out this system it is the department's purpose that every recruit shall be given at the outset the line of training he wishes to pursue, and when he has made his choice, he shall be assigned to a regular course and be given regular training and instructions along the line of work that he has selected.

2. The needs of the men in the groundwork necessary to their instruction and training along trade or vocational lines will, of course, vary, and as a first step this need will be determined in the case of each individual, and such educational groundwork as is necessary will be given him.

3. After the recruit has been under instruction and training for a sufficient period to determine in which direction he should, with better advantage to himself, be further trained, the commanding officer of the ship or station shall cause him to be assigned to the kind of instruction and training for which he has demonstrated an aptitude.

JOSEPHUS DANIELS,
Secretary of the Navy.

On December 16, 1913, I issued General Order No. 63, giving the detailed plans and orders for instruction on board ship, stating in the first paragraph:

"The following plan for the instruction of enlisted men, petty officers, and warrant officers of the Navy serving on board ship will be put into effect January 1, 1914, with a view to supplying deficiencies in academic education and also to provide systematic means by which all enlisted men and warrant officers may receive the assistance and encouragement in technical branches which may be necessary to fit them for promotion in the Navy or which will better prepare them for civil trades at the end of their period of service afloat."

This general order is of such importance that I will insert it in the record in full.

It was sent out to the service with the following letter of January 3, 1914:

"NAVY DEPARTMENT,
"Washington, January 3, 1914.

"Subject: Inauguration of Navy educational system.

"1. I am inclosing a copy of General Order No. 63, which relates to the comprehensive educational system the department has undertaken to establish in the Navy, just received from the printer. It is being sent in advance of the receipt of the full issue in order that commanding officers may know its requirements at the earliest moment. Requisitions for books considered necessary with which to begin are being filled as rapidly as possible, and it is hoped that there will be but a short interval between the receipt of the general order and that of practically all of the books.

"2. The department relies upon the hearty support of all officers in successfully carrying out the requirements of General Order No. 63 and depends upon commanding officers to put it into immediate execution as far as practicable, using such facilities as they can contrive and without awaiting the receipt of some books which may be delayed.

"3. The Secretary takes opportunity at the beginning of the new year, coincident with the beginning of this comprehensive naval educational system, to express to all officers his confidence in the system as being of the greatest value to the Navy and the country and his confidence in them to carry out its spirit with such zeal and energy that there can be no question of its success."

I think that letter of Gen. Lew Wallace is the most illuminating and able and discriminating argument in favor of the training of men in the Army and Navy that was ever written.

The astounding fact about Capt. Palmer's testimony is that he said he thought the Secretary of the Navy "lacked appreciation of training men in schools." Of course, the contrary was, is, and always has been my position. Not once but many times I have been charged with taking too much interest in education in the Navy. One critical officer once said: "The Secretary wishes to make the Navy a university instead of a fighting machine." That officer never appreciated that the more training a man has and the better education he receives the more efficient he can become in war as well as in peace. Education in the Navy is essential to securing the highest knowledge and skill in the naval profession.

From the day I became Secretary of the Navy until this hour I have zealously sought to promote schools and the training both of enlisted men and officers and these schools were enlarged and multiplied many fold in every line of training during the war. The record speaks for itself. It may be true that an officer in Navigation came into my office at times for approval of certain expenditures for schools or for barracks or other things which I did not act upon until I could ascertain that the money was available, or that I did not approve every identical proposition put up to me, or did not instantly approve every school project presented without investigation and consideration. As to some very costly projects, I required "to be shown." I remember as to some projects presented, I would ask the officer from Navigation:

"Out of what appropriation will you secure the money you ask?"

"I don't know," was sometimes the answer.

"Then secure the act or consult the solicitor and bring back the recommendation," I would say. This sensible and wise policy on my part seems now to have been regarded as "dilatatory."

Again, when some other project was proposed I would inquire:

"What will be the cost of this building?"

"I don't know," was the answer.

"Then ascertain and let me know before I can act."

The answer sometimes was given that the particular thing was essential at that very minute and we had to do it whether we had the money or not. I had an old-fashioned idea that, until we secured the emergency fund or had congressional approval, the department ought to be certain every expenditure was absolutely and immediately necessary, and I always had to know the expenditure was not in violation of law before it was authorized.

This is another article about the value of schools. I present that for the record. (The article referred to is here printed in full in the record as follows:)

NAVY'S SCHOOLS DID MUCH FOR ITS ENLISTED MEN.

The new educational system proved from the first popular with the enlisted men and did a great deal for them, promoting efficiency in their work as well as ambition to excel. Its purpose and workings are described in an account I wrote in February, 1914, which was published in the *Sunday Magazine*, from which the following is quoted:

THE NAVY'S UNIVERSITIES Afloat.

[By Josephus Daniels, Secretary of the Navy.]

A fundamental principle of one of the newer systems of child training has been defined to be that "the personality of the child must be liberated by methods adapted to his individual needs." The definition may be paraphrased to cover one of the underlying motives of the present administration in developing and coordinating the educational system in the Navy. This principle is that "the personality of the enlisted man may be liberated by methods adapted to his individual talents and trend."

We live in a day when the individual is being studied as never before. Not only are his present attainments being built upon to increase his usefulness to society, but his latent forces are being coaxed into flower and fruitage. Every angle at which a man may be developed makes him better fitted for service, and in developing the men of our Navy individually along the line of the natural endowment and the outcropping bend of mind of each I believe a greater efficiency for teamwork is secured which enhances the value of the men behind the guns in the day of battle.

The old adage that "knowledge is power" is trite; but it is just as true to-day as when our forefathers scrawled it in large and awkward letters in their copybooks when they were school children. I believe a man is a better coal passer for being able to parse sentences and bound the States of his country. A radio man will not be the less valuable for having studied the science of electricity—from the time Ben Franklin first lassoed it from the storm clouds with a kite and a key to the day when Field moored the continents alongside of each other with the cable, or when Marconi induced it to whisper words from hemisphere to hemisphere without wires. The lad at the wheel, who keeps the captain on the bridge informed as to whether the ship is on her course or not, must be even a better man for his job if he knows how to triangulate. And the boys behind the guns will be more efficient gun pointers from having a knowledge of azimuth and amplitude as taught by applied mathematics. If the enlisted man does not remain long in the Navy, his usefulness to his country as a citizen is nevertheless enhanced by what he has acquired in the Navy schools.

I confidently expect a ready response from the splendid personnel of the 51,500 sailor boys and 9,921 marines to the new educational régime of the Navy. Such a response was forthcoming when I ordered the winter cruise of the Atlantic Fleet to the Mediterranean instead of to Guantanamo. The word comes back—and it warmed the cockles of my heart—that the behavior of the men has been almost beyond criticism; that they were seen in the art galleries, in St. Peter's, in the Catacombs, and other places of interest, with notebook and pencil, and everyone had a word of praise for Uncle Sam's blue-jacket tourists. The newspaper *L'Eclair*, of Nice, voiced the unanimous good opinion when it said:

"Now that the fine American naval division is leaving us, we should like to place on record our admiration for the remarkably good behavior of the crews, not only on board their ships, where discipline is strict, but ashore. Altogether they behaved like gentlemen.

"Their bearing was irreproachable; their manners showed good education, and frequently rose above mere banal politeness. They taught us Frenchmen,

who pay no heed to the Marsellaise, a lesson when they stood rigidly at attention during the rendition of The Star-Spangled Banner.

"Secretary Daniels, when he ordered the cruise, did more than he foresaw. He intended to educate the crews; but he also educated us by showing us such splendid ships and men."

I expect a ready response to the enlarged educational system the nucleus of which is, of course, the already existing technical schools of the Navy. I am told that a good many boys go into the Navy because they really do not want to go to school at home. I have no idea how large a percentage of the total enlistment this is; but I do not believe it is very great. I want ambitious men in our Navy, which already, I believe, will compare favorably with any body of men in any navy in the world. If there are any who enlisted merely for a four-year bluejacket truancy, I feel confident that sober second thought will convince them that they are wrong, and if they are given the chance to develop along the lines of their individuality that they will develop the spirit of ambition and progress.

A recent and most interesting table shows the number of men in each school grade as given by the recruits themselves upon enlistment, and the percentage in each grade of the whole. The table affects 1,730 apprentice seamen received from July 2 to December 22, 1913, and shows as follows:

Grade.	Number in grade.	Per cent of whole.	Grade.	Number in grade.	Per cent. of whole.
College.....	18	1	Fourth grade.....	190	11
High school.....	312	18	Third grade.....	69	4
Eighth grade.....	173	10	Second grade.....	17	1
Seventh grade.....	380	22	First grade.....	86	5
Sixth grade.....	312	18			
Fifth grade.....	173	10	Total.....	1,730	100

The average ship's crew is a talented aggregation. It is always easy to pick out enough musicians to get a good band. There is always good editorial and reportorial talent aboard ship, as is evidenced by two excellent publications that have come to my attention—the *S. D.*, published by the men of the *South Dakota*, and the *Ark*, by the crew of the *Arkansas*. I am told that nearly every battleship has one. Many are taking correspondence courses with special callings for life in view.

I do not mean that they shall feel that they have no hardships to endure, no sacrifices to make. Concession must be made by every man. The separation from home, the necessary strict discipline of the ship, the frequently cramped quarters, and things of similar character are part of the calling of the sea; but the difference between the present and the past is striking.

An English writer said a hundred years ago, "Why do men go to sea when there are jails ashore?" The food was often full of maggots and the water brackish; so that scurvy was then common. Flogging was the mode of punishment for the slightest offense. Paul Jones won the confidence of his men by flinging a cat-o'-nine-tails overboard, and a Secretary of the Navy from North Carolina (Dobbins) secured the abolition of the whip. But for decades it was resorted to, the offender being taken aft, his outspread arms triced to a grating, and 12 lashes applied. The bilges were more than malodorous, and dead rats bred death. The purser, an appointed civilian, used to charge 12 times the value of what the sailor bought. The cruises were long, and "a battle came as a break in the monotony."

The improvement in conditions aboard ship is a commentary on the advance of civilization, and I hope the men of our Navy, comparing the past with the present, will be inspired to make every possible use of their opportunities.

In developing the educational system of the Navy in times of peace, all the while giving us the surest guaranty of peace by maintaining it strong enough to command world-wide respect, one aim has been to make a term of enlistment such an attractive opportunity that few young men would care to pass it by. Instead of considering the enlisted men as a mass, they will be considered individually. Each and every man will be given the chance in his life to advance in his chosen career as though he was attending his State university, whether his desire be to remain in the service or to return to

civil life; with the added advantage of having traveled over a great part of the world, having seen places and done things that the ordinary student at home can not see and can only read about; all the while happy and glad because trained in naval discipline so as to make him at the first emergency a most valuable unit in strategy and warfare.

Since the Navy will be maintained and kept at its highest efficiency, it behooves all of us to derive the greatest advantages we may out of it. Alchemy is said to effect excellent transmutations of elements. I hope to invoke an educational alchemy that will change an engine of destruction into a school—and the main by-product of education is peace.

The department has emphasized its policy to raise the standard of the enlisted man on board ship with a view to increased efficiency by attaching to the service the most desirable candidates and retaining them whenever possible after they have become useful to the Government. Better and sure opportunities for advancement are provided for; educational features established to fit them for advancement, and encouragement given to all to make use of these advantages. The present policy of the department is to consider the needs of the men behind the guns. The interests of the personnel have been constantly in mind.

While none can appreciate more profoundly than I that the supreme purpose for which the Navy exists is as the right arm of American defense, it is none the less true that its efficiency as a fighting force will be in the highest sense promoted to the adoption of a serious and systematic course of instruction aboard ship and at all shore stations, to supply wherever possible ascertained deficiencies in academic education; perfecting the already existing technical instruction, and coordinating the entire educational work of the Navy.

It is my ambition to make the Navy a great university, with college extensions afloat and ashore. Every ship should be a school, and every enlisted man, petty and warrant officer should be given the opportunity to improve his mind, better his position, and fit himself for promotion. In this way habits of study and application will be formed by the men, which will make them more alert, more efficient, more ambitious, and conduce to a general uplifting, which will be reflected in better discipline and in an improved morale throughout the ships. It will keep the minds of the men occupied, give them a more definite aim, and make for contentment and happiness.

Training produces skill, and skill not only produces efficiency but enhances self-respect. It is admitted by naval officers that at present not only seamen, but even petty officers, have too little accurate knowledge. Their knowledge is approximate. They know that a thing is habitually done, but not always why it is done. This will be corrected by the systematizing of courses of instruction proposed. The school work will be of special advantage in case of reenlistments, because education always whets the edge of ambition and fosters the impulses of patriotism; but even if the sailor returns to civil life after his first term he will be better fitted for the duties of citizenship, and the trade he has acquired in the Navy will make him a skilled breadwinner. The Navy will return him, under these improved conditions, to his country and dwelling place better in mind and in manhood than when it first received him without at any time having sacrificed his usefulness to the Navy in any way whatsoever.

The educational system was first tried out on the *Des Moines*, and, the results proving entirely satisfactory, and promising further benefit, the system was put into effect throughout the entire Navy on the first of the year on board every ship and at all shore stations. The majority of the instructors will be young officers graduated from the Naval Academy. Midshipmen of the graduating class will have impressed upon them the fact that next to their man-of-war duties their most important work from the time they leave Annapolis will be in connection with the instruction of recruits in academic and technical subjects.

This naval educational policy is based mainly upon the 4 training schools for recruits at Newport, Norfolk, Chicago, and San Francisco, supplemented by 11 already existing technical schools maintained by the Government. Including a machinists' school at Charleston, S. C.; electricians' school at New York and Mare Island; torpedo school at Newport, R. I.; seaman gunners' school at Washington, D. C.; artificers' school at Norfolk, Va.; musicians' schools at Norfolk and San Francisco; yeomen's schools at Newport and San

Francisco; and a school for cooks and bakers at Newport. These schools are every day converting raw recruits into skilled men in the various trades required by the naval service.

The system of instruction will be standardized on all ships, so that men transferred from one vessel to another will not be the loser by the change. An officer on board each ship will be assigned to supervise and assist the work of all enlisted men who, by reason of their initiative and ambition, may have taken up correspondence courses with outside institutions. Classes for warrant officers, chief petty officers, and others, and special classes for enlisted men in the commissary branch, Pay Department, Hospital Corps, and other divisions on board ship, who seek promotion will be formed.

There is a decrease at present in the number of desertions. Some years ago desertions from the Navy were so frequent as to constitute a serious problem. Education and proper diversions are the best remedies for unlawful absenteeism, because they tend to make life aboard ship happier—and the only good ship is the happy ship. There have been added more avenues of promotion and better recognition of the intelligent and efficient enlisted personnel, upon which the success of the Navy so largely depends.

The high ethics of the naval personnel forbids the existence of any spirit of favoritism or the denial of just and equal opportunity to all. It is to be hoped that the day will soon come when all Members of Congress who have the right to choose midshipmen for the Naval Academy will name the candidates who demonstrate their capacity in competitive examinations, because experience has shown that youths admitted by fair competitive examinations rank higher than those who enter without competition.

The question presses whether appointments of future naval officers would not be improved by the competitive method. This was especially proved to me last year, when there remained 10 vacancies for the position of assistant paymaster in the Navy out of the 30 additional appointments authorized by Congress in the summer of 1912. It was my privilege to recommend the appointees. There did not lack a number of applicants with influential backing; but it seemed to me that the vacancies in question offered the first opportunity to open a new door to enlisted men to take the examination for the positions available.

The order to that effect carried practical evidence of the desire, under the present administration, to secure more promotion for the men who did not enjoy the advantages of Annapolis training. Many candidates began to study to prepare themselves for the examination, and those who made the highest marks will be appointed. Those who have been promoted from the ranks have shown themselves worthy, and the Navy will reap the benefit of their experience in these positions of usefulness and honor. A steadily increasing number of promotions of those who demonstrate their fitness will give a new stimulus to all who enlist. Upon the efficiency of the personnel depends the success of the Navy.

These improvements and changes are all comparatively recent, and some are yet in their process of working out. As a result there must be other changes that can be operated only through congressional cooperation. The best impulse that can be given to the enlisted men in the Navy is to open new doors of advancement and promotion. Thousands every year come into the service—8,448 in 1913, compared with 6,005 in 1910—bringing the talents and the ambitions essential to the production of our best American citizenship. It was true that there was no chance of promotion from raw recruit to admiral except in the case of a genius to whom metes and bounds counted for naught. There are yet, however, too few opportunities for the capable and aspiring enlisted men; though year by year new doors of hope and opportunity are opened to them.

Congress should seek to make the way to high station easier to enlisted men. The avenue from the man below decks to the admiralship should be made easier. It is now too difficult. I hope that favorable congressional action will follow early enough to do some good, not only to those who enlist from now on, but also to those who enlisted in the past and have studied diligently, with a view to being promoted as soon as chance offered.

In speaking for what is now an entirely regenerated system for the good of the file in the Navy, I speak, of course, with a view to recommending the career to those youths who consider themselves fitted for the life, and particularly those who have remained in doubt as to what advantages are offered. In-

genuity and individuality will count in their favor. Recognition and merit have displaced political protection and favoritism.

The full quota is not far short of being complete, and at the time of writing the vacancies are under a thousand. The full quota of the Marine Corps of 9,921 was filled in October, notwithstanding the fact that the standard for admission has been raised and that there has been a rigid exclusion of those not morally or physically fit. But additional openings will be automatically established with the commissioning of additional ships, and also to fill the vacancies caused by those who are either promoted or who return to civil life at the end of their enlistment terms.

The American Navy to-day desires men who are open minded, quick to discover better ways of construction and control, studious and inventive, ready to discard the old and test the new. There is no longer a place in the Navy for the standpatter. We wish for more emphasis upon initiative and less upon regulations. I am not sure that initiative all along the line, from admiral down to raw recruit, has been given the free play necessary for its best development. The only hope for the best service is that it shall be spontaneous and enthusiastic, that encouragement shall come to those who study and bring to light new and better things.

Secretary DANIELS. I can finish in an hour or perhaps an hour and a half this afternoon, Mr. Chairman.

The CHAIRMAN. We will adjourn, then, until 2 o'clock p. m.

(At 12.45 o'clock p. m. the subcommittee took a recess until 2 o'clock p. m.)

AFTERNOON SESSION.

The subcommittee reconvened, pursuant to the taking of the recess, at 2 o'clock p. m., Hon. Frederick Hale (chairman) presiding.

TESTIMONY OF HON. JOSEPHUS DANIELS, SECRETARY OF THE NAVY—Resumed.

The CHAIRMAN. Proceed, Mr. Secretary.

Secretary DANIELS. Mr. Chairman, I desire to insert in the record the following note received from Admiral Mayo:

DEPARTMENT OF THE NAVY,
GENERAL BOARD,
WASHINGTON, May 18, 1920.

MY DEAR MR. SECRETARY: I have this morning read your statement before the Senate subcommittee made on May 14. I think you are undoubtedly right in holding that Admiral Sims's charge as to the responsibility of the Navy for the loss of 500,000 lives, etc., is entirely unwarranted. I consider that this assertion of Admiral Sims is a wild statement not at all susceptible of proof, and it is an unwarranted attack upon the Navy Department and the Navy.

Very respectfully,

H. T. MAYO,
Rear Admiral, United States Navy

HON. JOSEPHUS DANIELS,
Secretary of the Navy, Washington, D. C.

That is from Admiral H. T. Mayo, who was for a longer time than any other man in this generation commander in chief of the American fleet.

NAVY'S WORK IN WAR.

SIMS AND ALL OTHER WITNESSES AGREE THAT THE NAVY AS A WHOLE DID GREAT WORK IN THE WAR.

In all the weeks this investigation has been going on it is a notable fact that of all the witnesses who have appeared before this committee not one has denied that the Navy as a whole did a great work and

showed marked efficiency in the World War. No one can deny that; it is a matter of history, and even the witnesses who were severest in their criticisms have testified to the Navy's splendid, almost unparalleled, achievement.

I submit the following statement, Mr. Chairman, for the record. I will not read it.

(The matter submitted by Secretary Daniels is here printed in full in the record, as follows:)

Admiral Sims in his preliminary statement said:

"I have raised no question whatever as to the efficiency of our naval operations in the war when viewed in their entirety and without regard to the time element.

"Speaking of the Navy itself—that is, its personnel and ships apart from the organization which directed it—I am in the fullest accord with the country in being unable adequately to express my admiration for its work. That work will grow larger and larger in public estimation as the facts slowly come out. I am proud to say, without fear of contradiction, that, in so far as the Navy was permitted by the machinery which controlled and directed it, it not only lived up to all traditions of the past but, as a matter of fact, it excelled its former traditions. Without any disparagement of actual results accomplished, I believe that its greatest accomplishment was the example set and the spirit which it infused into the naval war through its exhibitions of Americanism. For example, in its irresponsible enthusiasm, its indomitable initiative and versatility, its absolute refusal to be balked by obstacles, real or imaginary, its ruthless disregard of precedents, and, above all, in its absolute confidence in victory.

The Admiral, in fact, paid tribute to the "very marked efficiency that the Navy Department exhibited in the latter part of the war." He took pains to direct attention to the fact that his letter of January 7, 1920, which is the basis of this investigation, is "almost wholly concerned" with the months immediately preceding our entry into the war and for about the first year or less of our participation, and that in considering the letter "the case must not be confused with the conduct of the war as a whole."

"The period of the war covered by my letter is encompassed almost wholly in the first six or eight months thereof," he said, and went on to say:

Incidentally let me state right here, with all possible emphasis, that my entire letter of January 7, 1920 refers to this early period of the war. Practically all of it refers to the first six months. Hardly any of it refers to anything out of the first year, 1917. It has practically nothing to do with the efficiency of the Navy and the Navy Department in 1918.

I expect, during the course of my testimony, to make that statement a number of times, because I want it to be definitely understood that my criticism has nothing to do whatever with the very marked efficiency that the Navy Department exhibited in the latter part of the war, after they really got into it.

PALMER SAID NO SHIP WAS DELAYED FOR LACK OF PERSONNEL.

Capt. Palmer, who was Chief of the Bureau of Navigation from August, 1916, to October, 1918, has told you how the personnel of the Navy was expanded tenfold, until it embraced more than 30,000 officers and half a million men—a record never approached in a similar period by any other Navy in history—and he quoted to you this tribute of Sir Eric Geddes, first lord of the British Admiralty:

The dauntless determination which the United States has displayed in creating this huge trained body of seamen out of landmen is one of the most striking accomplishments of the war. Had it not been effectively done one would have thought it impossible, but words fail me to express our admiration of this feat undertaken and accomplished by your Navy Department, of which Mr. Daniels is the civil chief.

HAD MORE OFFICERS AND MEN THAN THE BRITISH NAVY.

In fact, the United States Navy, before the end of hostilities, embraced more men, including marines, than were in service in all the navies of the world before the European war began in 1914. The Statistical tables relating to the period of the war," presented to the British Parliament by the first lord of the Admiralty, explanatory of the navy estimates for 1919-20, show that on July 15, 1914, there were in service in the British Navy 146,047 men, and on November 15, 1918, the total, exclusive of the mercantile marine reserve, was 407,316. The gross expansion of personnel in the British Navy during the war, Mr. Long shows, was 261,269, including 3,842 reserves, and the net expansion, excluding reserves already enrolled, was 197,427.

Beginning with 85,061 officers and men, on April 6, 1917, the United States Navy reached a total of 532,931 officers and men in naval service, and we also had 75,044 marines—a total force of 607,975. Our gross increase was 447,870 in the naval service, including reserves, Naval Militia, and Coast Guard; 61,314 in the Marine Corps; total, 509,184. Net increase in naval service alone, excluding reserves, Naval Militia, and Coast Guard enrolled before the war (17,352), 430,518. Net increase, including marines, 491,832.

PERSONNEL PROVIDED FOR EVERY ACTIVITY.

Capt. Palmer has told you how plans were made far in advance to secure the men and officers needed, and said:

Actually, in coming down to the definite preparation of personnel, we worked out a sheet, which was good for a year in advance, from the knowledge we had of the things that ought to be undertaken and from the orders we had from the Chief of Naval Operations; so that we knew at any time where we were going to get the personnel and how we were going to train it and where, at all the different schools, training stations, and colleges, and just how long it would probably take to deliver these men to the Navy; that is, to follow out what the Chief of Naval Operations wanted us to do.

In all this work, as it continued during the war, every activity of naval operations, whether afloat or ashore, was carried out—certainly to the extent of numbers of officers and men. That is, we had the men and officers ready by the time the ships were ready to start; but, of course, that is not saying they were trained. They were trained as well as they could be in the time that had been given us.

In answer to questions by Senator Trammell, Capt. Palmer said:

I had the personnel actually ready at the seaports to put on vessels before the vessels were ready. We never had a delay of a vessel on account of not having the officers and men; but I will not say that they were very highly trained.

In response to Senator Trammell's question as to whether, taking it as a whole, the men provided accomplished results, Capt. Palmer said:

I should say that the results accomplished by the Navy were perfectly wonderful during this war.

DEPARTMENT DOING ALL THE LAW ALLOWED, LANING TESTIFIED.

Capt. Laning, who was from July 16, 1917, detail officer and afterwards Assistant Chief of the Bureau of Navigation, told you that the Navy Department at the time we entered the war was doing

everything Congress had authorized as to personnel and material. quote from the record:

Senator TRAMMELL. Capt. Laning, you speak of not having prepared in material and personnel. Was the Navy built up to the limit in personnel as authorized by law?

Capt. LANING. Approximately, yes.

Senator TRAMMELL. Then the Navy Department was exercising its full authority and to its full limit as far as authorized by law in regard to personnel?

Capt. LANING. Yes; it had all it could get.

Senator TRAMMELL. Whose neglect was it that you were not equipped as far as the law authorized you in material?

Capt. LANING. That was due to the fact that we did not have the funds to provide all the material that was essential. That is, on battleships, for instance, we are always developing new things in the way of fire control—that is, the control of the firing of the guns—and frequently those things were not put in, because we did not have the funds available to put them in.

Senator TRAMMELL. The Navy Department was doing the best it could, then as far as material was concerned, considering the available funds?

Capt. LANING. Oh, yes; there is not any question about that; but the point made was that it had not presented the facts to Congress so as to get the funds it ought to have had to do those things.

SIMS THREATENED INVESTIGATION IN AUGUST, 1918.

Capt. Laning's letter to Admiral Sims, written during war, dated August 26, 1918, quotes a paragraph from Sims's letter to Capt. Pratt, which had been given to Capt. Laning to answer, which indicates that Admiral Sims was, even then, in August, 1918, contemplating hearings "on the conduct of the war," such as are now being conducted by this committee. This paragraph, to which I direct your particular attention, is as follows:

When the history of this war comes to be written there will be a number of features that will not be very creditable to the United States Navy. I hearings are held on the conduct of the war a number of disagreeable facts must inevitably be brought out. Without going into details, I may say that as far as the Navy is concerned we will have fought this war with the bulk of our experienced personnel of the Navy on the side of the ocean where there is no war. We will have to be able to show that it was entirely unnecessary that we should have to fight the war over here with a large proportion of reserve officers who did not have the necessary experience.

That threat of Admiral Sims's, written 20 months ago, makes positively ridiculous his attempt to create the impression that his letter of January 7, 1920, was dragged out of him by this committee or was written for any other purpose than to precipitate an investigation and enable him to set forth all the things he could gather which he thought would "not be very creditable" to the Navy.

Capt. Laning's letter was such a complete answer to Admiral Sims's complaints regarding personnel, as well as to an article by W. R. Carter, demanding more regular officers on submarines; it gives such a good account of the vast work the Navy was doing, which Sims ignored, that I quote from it at length.

LANING STATED NAVY'S WORK AND PERSONNEL POLICY.

Answering Sims's allegation that "the bulk of our experienced personnel of the Navy" is "on the side of the ocean where there is no war," Capt. Laning says:

It is that paragraph that hurts. Are you sure that the bulk of our experienced personnel is on this side of the water now? Of course, if you don't

count the cruisers and transports, you are right, but if you do count them as being engaged in active work you are wrong. Do you realize that ultimately two-fifths of our experienced personnel will be on destroyers alone and of the remaining three-fifths at least half will be over there before the war is over, provided, of course, transports and cruisers may be considered as working in the danger zone? The bulk may not be there to-day, but we are expecting them to go and are planning for it. Please remember experienced officers number all told only about 2,370, and there is much to do over here that may be less spectacular and not deserving of credit, yet for all that it is work that without which the Hun can't be licked.

ADOPTED BROAD PLANS TO BUILD UP GREAT NAVY.

After explaining that when war was declared we had only 2,394 line officers in the Navy, Capt. Laning says:

It is evident that a decision had to be made and made at once as to what the Navy should do in the war. We could take our 2,394 officers and our 57,000 enlisted men, man what ships we could and let it go at that, or we could use those officers and those men as a foundation on which to build a truly great Navy, one that could actually deal some blows to the Huns. It was evident that what we then had could not win the war, so that the second plan had to be adopted. We may have made our initial error at that time and should have been content with a 57,000-man Navy instead of the 400,000-man Navy we are rapidly coming to. Up to the present, however, we have no reason to think we have erred in adopting the plan of an expanding Navy.

We took advantage of the enemy's inability to strike hard while we were building up our Navy for such a great war. The problem as it seems to us was not to deliver a puny and futile blow at the start but to build for the blows that in the end must crush the enemy. To have wasted our strength to strike quickly when that strength was not sufficient to win would have been foolish. We would have sacrificed all and in the end would have been only worse off than at the start.

Our mission was and is to decisively beat the enemy. If we accept some smaller mission, we won't win the war. The first mission, subordinate to but a part of grand mission, was to defeat the U-boats. Almost every one assigned a task in that first mission immediately ran away with the idea that it was about the only mission we had. They were fortunate enough to get in the game, but once there they saw only their part in it. Even you yourself questioned the advisability of keeping our battleships in commission and suggested putting them out to send the personnel over there. To have done that would have been disastrous, for those battleships have trained over a hundred thousand men and thousands of officers, which we would not have now, had we carried out the suggestion.

We recognize the importance of the work against the U-boats but we did not think that their extinction could alone win the war nor that even by sending all our 2,394 officers over we could extinguish them. As early as July 1, last year, it became known on this side, that no matter how much we curtailed the U-boats the war would be lost if we did not get troops to France. How were the troops to get there unless the Navy took them? The situation in our merchant marine was such that they simply could not carry out the task of transporting those troops even assuming that their officers were sufficiently skilled in handling ships in convoys. The Navy not only had to convoy the troops across but also it had to operate all the transports flying the United States flag. It at once became evident every cruiser we have would be a vital factor and that transports were even more vital.

TROOPS TRANSPORTED SAVED THE DAY.

Suppose the transport service had not been developed early where would we and our allies have been to-day? Just as the little force we put in against the subs swing the balance in our favor on the sea, so the transport and cruiser force later swing the balance on land to our side. Hasn't it turned out that making your force go, and making the transport and cruiser force go, were the allied salvation? We now operate over 40 troop transports and several hundred cargo transports. We could not have had either the officers or the men to man

them had we stripped this side for your side early in the war, yet without them could the enemy have been stopped on land? Those troops of ours are saving the day and I believe it would be unfair to put blame on the department for putting them across instead of sending the personnel to chase submarines. Both things were essential but neither one by itself could save the day. By sacrificing something in our U-boat efforts the transports have gotten across, but had we sacrificed the transports to sink U-boats our troops wouldn't have gotten over and without them where would our allies be now?

Surely we must concede that there were at least two important missions under our general mission—(1) the curbing of the U-boats and (2) the delivery of troops to France. Were these our only missions? I don't believe so, and certainly not after being privileged to read some of your own letters on the subject of battleships.

Already we have been called on to send some battleships across and I dare say all the other first line ships will sooner or later be called on, perhaps not with the Grant Fleet but for some other important duties in the war area. Will any one question the advisability of our keeping those ships ready? Because they are not being used on the line to-day is not proof that they won't be called on to-morrow. Anyhow we believe they must be ready and surely in this you agree. This will account for our dreadnaughts, now what about our older battleships? There is the rub. What are those old tubs doing? They are the ground work of the whole scheme for a Navy big enough to win this war. Without them we would practically have no training place at sea for the hundreds of thousands of men and the thousands of officers required to man new battleships, new destroyers, transports, cargo ships, mine sweepers, submarines, subchasers, and the many other types of craft we are turning out in great numbers.

We have an average of 10 regulars on each of those ships or 180 in all. Hidden away from all excitement and all chances of honor and renown those fellows work harder than any one and make possible the manning of our thousands of ships. Does young Carter mean that we should cut off our sole means of preparing personnel for the expansion to send more officers to the chasers? For the present we might get more U-boats, but in the long run we would do less to win the war. I believe that the missions of our battleship forces are an essential part of the general mission and that neither of these subsidiary missions can logically be sacrificed to insure the better carrying out of another subsidiary mission. The missions are (3) for dreadnaughts to be instantly ready for battle, and (4) for predreadnaughts to train combatant officers and men to run the over expanding Navy.

I have so far covered our major operating forces but have endeavored to show how the rôle each is playing is essential and one that can not be cast aside. We have other forces of course, such as the submarine force, the district forces, etc. Of these only the submarine force has any regular officers and then only in small numbers. The Caribbean patrol is made up almost entirely of reserve and coast guard officers. In fact every force has only a leaven of regulars, the vast majority of officers attached permanently to any naval vessel on this side are newly made. On dreadnaughts on this side we now have a total of 14 regulars, on predreadnaughts average 10, on armored cruisers 10, on first-class cruisers 7, on smaller cruisers 4, on gunboats 3, etc. As new construction comes on the regulars will become fewer and fewer on each ship. Each regular is actively at work, each is engaged on the general plan, and each is doing what we believe will finally be the total defeat of the enemy.

So far I have touched only on officers afloat. There are a considerable number of regulars who much to their disgust are held on shore duty. It may be contended that these do not belong there but if one looks into the situation even casually he would be amazed that we have gotten along with so few on that duty. As a matter of fact the feeling here is that because of the lack of officers for the handling of the shore end, that end is probably not succeeding as well as it should. Although every retired officer that can function has been called to active duty and hundreds of reserve officers have been put in such positions ashore as they are competent to fill, the shore end is having a difficult time to carry on its work. We are spending billions of money for material the providing of which must be handled by experienced officers. We have 200,000 men in training alone on shore for which we must have some experienced officers. Great Lake Training Station with 47,000 men has three

regulars of the active list. Others are similarly curtailed. I could recite the details and they would astonish you but there is no use.

I am sure you will believe me when I tell you that to-day regular officers are working to the limit of their endurance on shore and their accomplishments would have been considered impossibilities 18 months ago. But the situation on shore is such that we are open to severe criticism, because we have not sufficient officers to do the work as it should be done or to properly safeguard the expenditure of billions of dollars.

20,000 OFFICERS, 200,000 MEN TO MAN CARGO SHIPS.

One of the big tasks that has fallen to the Navy is to man and operate the 2,000 merchant ships now being built by the Shipping Board. The supply of merchant officers and merchant sailors is exhausted and the Navy alone has the facilities and organization to provide the personnel. While the cry that "ships will win the war" may not be correct, it is pretty certain that we can't win without them. And so the Navy will train and provide 20,000 officers and 200,000 men for these ships. It doesn't take many regulars to handle this task but it takes some. Is their task such that they can be taken from it?

ALL OUR FORCES USED IN WINNING THE WAR.

We can't win the war with anything less than all our forces. We might throw battleships in the discard, but would you advise it? We can't throw our training ships (old battleships) out and continue to expand. We can't cut down our cruisers and transports without curtailing our troop movements. We can't cut down our shore end lest the sea end falls because of a shore-end failure. And so it goes all along the line. I have studied the situation—in fact, do nothing else but study it—and I can't see any way to send a larger proportion of trained men to the chasers over there than we are sending. I admit it would be well to do it if we could, but it can be done only by sacrificing something else. Looking at it in the broad light, what would you sacrifice?

Reading over Carter's article, do you believe he had my conception of the total effort of the United States Navy? He has written a very convincing article. His caption is good and his logic sounds plausible, provided his premises are correct. He makes a general estimate of the situation from the one point on the line that he sees, though general deduction from local and incomplete information are valueless. The great trouble with such arguments presented as his are, is that when spread around it weakens the morale.

CURBING SUBMARINES NOT THE "CURE-ALL."

Let me point out where Carter is dead wrong. In his opening paragraphs he assumes that the most important work of the United States Navy is either one of two things—the defeat of the Germans on the sea or the defeat of the Germans under sea. With that premise and the use of false logic he proves his case. Both his premise and logic are wrong.

The important work of the United States and its allies is to beat the Huns. It doesn't make any difference where we beat them, just so we do; it may be on the sea, but it is much more likely to be on land. It is the Navy's business to use its efforts to beat them whether it be done on land or sea. If we can more certainly beat them on land, and it looks like that is where we must beat them, then our principal effort must be to help beat him on land. And, after all, beating him on the sea is on land. We can win this war if we can beat him on land and can prevent him beating us on the sea, and it looks like our plan to that end will be successful. Carter fails to see this, fails to grasp what the Allies' general plan is, and therefore his whole idea is illogical.

But Carter is wrong elsewhere than in his assumptions. He apparently thinks the end of submarine warfare is the cure-all. Suppose we had done as Carter implies we should—stop everything that doesn't tend to curb the U-boats. Would not the Allies be in a nice mess to-day if we had adopted that plan a year ago and forsaken our transportation of troops? Suppose we had kept up our troop arrangements and cast aside battleships, would not "Fritz" have a better chance to win on the sea with our reserve fighting force irreparably out of business? The mere fact that even if he should lick the British Grand Fleet, there is another fleet ready to fill the gap must have had some effect on his

plans; and anyhow, if it did not, it is a mighty good thing we have a strong reserve fleet against the slight possibility of his success? As a matter of fact, there simply is not any cure-all. We have got to work along all our lines, doing each as best we can, keeping in mind that defeating the enemy on one line can not and will not by itself win the war in a reasonable time.

Mr. Chairman, I have here some extracts from the testimony bringing out points from the testimony of every witness that has appeared before you. I do not suppose it is necessary to read those.

The CHAIRMAN. No.

GUNNERY AT HIGHEST STATE OF EFFICIENCY, ADMIRAL PLUNKETT
TESTIFIED.

Rear Admiral Plunkett, who was director of gunnery exercises and target practice and later commanded the naval railway batteries in France, told you that at the time we entered the war our gunnery was "at the highest state of efficiency" that it had ever been in the history of the Navy. He said:

At the end of March, 1917, when we were on the verge of entry into the war, the gunnery was at the highest state of efficiency that it has been in the history of the American Navy.

In describing how this high state of efficiency was brought about, Admiral Plunkett said:

Never in the history of the Navy has there been anything more intensive than the gunnery training of our fleet which took place in 1916, 1917, and 1918. The result of that was that when the war broke out, although we were still un-manned, the gunnery efficiency of the ships that were in commission was higher than it had ever been before in my recollection of the Navy. As a matter of fact, we had just one battleship, the *Wyoming*, fire in practice at nearly 20,000 yards, the longest range that has ever been fired by the service, and she made the phenomenal score of 20 per cent of hits under battle conditions.

I was with the fleet in the spring of 1917, and left there about the middle of March and came back to Washington, and on my arrival here shortly afterwards I submitted to the Chief of Naval Operations the report of the status of gunnery operations in the fleet, in which I summarized the practices that had taken place in a general way in order that he might have first-hand information as to the state of affairs just before the outbreak of the war. I did not comment in this report on the excellence of the training, but just merely stated what forms of target practice had been carried out and made a recommendation that the training continue just as it had been; that there were no changes to make; that I was in full agreement with the commander in chief that everything had been done in the way of laying down correct lines for gunnery training, and that, war or no war, we saw no reason for making any change in that direction.

PRAISED SPLENDID WORK DONE BY ARMED GUARDS.

Speaking of the work of the Navy's armed guards on merchant vessels, many of which gun crews were taken from or trained by the fleet, Admiral Plunkett said:

This armed-guard proposition, which was clearly beyond any foresight, although the Allies had been doing this for some time, was the cause of the breaking up of the efficient condition of what we had in commission at the outbreak of the war, for the simple reason that when you put a military man on board of a merchant ship they want to deny him the air necessary for his sustenance. They have to have him around. As a matter of fact, I think the putting of guns on merchant ships is very much against the wishes of the merchant people, but they did put them aboard; and in order to avoid any possible disruption or disputes, although there were a few minor ones, of course, we sent the highest type of our chief petty officers in charge of these guards and officers, so that if questions did arise they would be handled in the proper

inner; and I might say, in passing, that if the members of this committee have never read the reports of our armed guards, especially those written by our chief petty officers, they have missed some of the most illustrious history that has ever been written of the sea. The work that those people did is thrilling, and I do not know a single, solitary case in which they failed to measure up to what was expected of them. But it raised Cain with the American Navy.

"FLEET IN BEST STATE OF PREPAREDNESS," MAYO TESTIFIED.

Admiral Mayo, who, previous to and during the war, was commander in chief of the Atlantic Fleet, told you:

When the active fleet arrived in Hampton Roads, about the 1st of April, after a training period in Cuban waters, it was in the best state of preparedness it had ever been, and there was a feeling of confidence in the personnel of being able to cope with any emergency. The personnel was, however, on a peace basis, and the transfer of trained personnel for armed guard and other duty was already being felt in a decrease in efficiency. The destroyers that were first dispatched to the war zone, though they were assigned to operations which they had not been specially trained, showed the effect of their general training by the efficiency with which they at once entered into their new duties.

However, it should be pointed out that this fleet was lacking in types of vessels essential to efficiency, such as battle cruisers, scout cruisers, light cruisers, and sea-keeping submarines, and, furthermore, there are none even now available.

The material readiness of the active fleet was from good to very good. That was the condition was demonstrated again and again by the duties performed by the vessels during the war. The details are given in the several dispatches and letters that are a part of this statement.

The preceding remarks apply also to the readiness of the available personnel and to the soundness of the methods of training and operation in use at the time.

PREPARING FOR WAR TWO AND A HALF YEARS BEFORE WAR WAS DECLARED.

Admiral Mayo has told you how in 1914, immediately after the outbreak of war in Europe, when Admiral Fletcher was commander in chief, "plans were made to assemble the fleet, which had been engaged in Mexican waters, and put it into as good shape as possible." "At this time," says Admiral Mayo, "there was a strong feeling among all officers that the Atlantic Fleet should be prepared for any duty and that as many ships as possible should be in full commission. In December, 1914, the department issued instructions to all navy yards to so arrange the authorized work that the battleships could assemble in January, 1915, for the work in Cuban waters."

He told you how "the natural increase in the number of vessels" led to a reorganization of the fleet, which was made effective in 1915, and said:

There was a very general feeling that the training should be intensified and no effort spared to get the ships ready for war. The subject was discussed with the division commanders and instructions regarding the subject were issued. * * * The new organization proved very effective and continued in force.

Admiral Mayo has told you in detail the work of the fleet from the time he succeeded Admiral Fletcher as commander in chief, June 1916. He has described to you how the organization put into

effect the previous year under Admiral Fletcher was developed, and how intensive training was carried on, and every energy was devoted to preparation of the fleet for war. In telling of the revised fleet regulations issued he quoted several paragraphs showing that "the approved principles of command were in use and that the idea of readiness for war was always emphasized in the fleet." He told of the strategic problem conducted off the New York coast in 1916, and described in detail the exercises in Cuban waters early in 1917 and the measures taken immediately after the breaking off of relations with Germany, saying:

The above preparations indicate that the preparedness of the active fleet was proceeding in accordance with a prearranged plan.

PREPARATIONS MADE IN MONTH PRECEDING WAR.

Admiral Mayo has told you how before war was declared and while the fleet was still in Cuban waters gun crews were rushed north to serve as armed guards on merchantment. They were at New York ready for immediate service the moment the President ordered that American merchant ships be armed for protection against submarine attack. The battleships and destroyers arrived in Hampton Roads at 9.30 a. m. March 27, and the next day Admiral Mayo was in Washington consulting with the Chief of Naval Operations, who told him that the policy was to maintain the fleet in readiness for active operations and to continue intensive training of gun crews for armed-guard duty, and he was informed of the contemplated formation of the patrol force. He was directed in accordance with his recommendations, to shift the fleet base to York River, Va., which was done on April 3, and measures put in effect to protect it from submarine attack. Admiral Mayo's conference with the Chief of Naval Operations was held on March 29, the same day Admiral Sims was ordered to go to England. Orders were issued April 4 for the organization of the patrol force. All this occurred previous to the declaration of war.

FLEET ASSEMBLED AND READY, MOBILIZED FOR WAR THE DAY WAR WAS DECLARED.

The following extracts from his records given by Admiral Mayo show that the fleet, which was not only in a high state of readiness but was already assembled at its war base and had its orders for mobilization, was mobilized for war the day war was declared:

April 6.—At 1.33 p. m. received 16 Alnav. "The President has signed act of Congress which declares that a state of war exists between United States and Germany."

A signal was immediately sent to the fleet * * * "War has commenced."

At 5.50 p. m. orders were received as follows:

"Mobilize for war in accordance department's confidential mobilization plan of March 21. Particular attention invited to paragraphs 6 and 8."

Paragraph 6 assigned rendezvous of various forces and paragraph 8 instructions with regard to fitting out at navy yards.

As has been indicated previously, the dispositions for the protection of the fleet at anchor in York River had been in operation during the period of strained relations.

IN CONFERENCE WITH BRITISH AND FRENCH ADMIRALS FOUR DAYS AFTER
WAR WAS DECLARED.

Three days after the declaration of war Admiral Mayo was informed that Vice Admiral Browning, commander in chief of the British forces in the western Atlantic, and Rear Admiral Grasset, commander of the French forces, were proceeding in their flagships to Hampton Roads for a conference with the Chief of Naval Operations (Admiral Benson), the commander in chief of the Atlantic Fleet (Admiral Mayo), and the commander of the patrol force (Capt. (now Admiral) H. B. Wilson).

He has told you of the conference held at the Hotel Chamberlain, Hampton roads, on April 10, four days after war was declared, at which Vice Admiral Browning read a communication from the British Admiralty inquiring as to what assistance the United States was prepared to render.

The conference adjourned, as he has told you, to meet the following day in Washington "to take up the suggestions of the foreign governments with the Secretary of the Navy, as Vice Admiral Browning considered his instructions required a conference with the Secretary of the Navy." He has told you that there were present at that conference the Secretary of the Navy, Admirals Browning, Grasset, Benson, Mayo, Wilson, and the members of the General Board, and that the "subjects discussed were those of the previous day—that is, cooperation with the Allies and the assistance the United States could and would render." Though he did not go into detail, Admiral Mayo, and every other person who was present, can testify to the fact that the British and French representatives were impressed by the cordiality with which their suggestions and requests were received and complied with and the evident disposition of the representatives of the United States Navy to accord the Allies every possible assistance.

ORDERS IMMEDIATELY ISSUED TO SEND DESTROYERS TO EUROPE

Admiral Mayo's testimony shows that it was decided to send destroyers to European waters to cooperate with the allied antisubmarine forces in that area, and he says:

Oral instructions were received to prepare six destroyers for distant service, selecting those boats which were most reliable from the point of view of material.

That conference, at which complete cooperation with the French and British was arranged and we agreed to take over the patrol of our Atlantic coast, the Caribbean Sea, and Gulf of Mexico, agreed as soon as possible to bring most of the Pacific Fleet into the Atlantic, to patrol South American waters, held April 11 and 12; and destroyers were ordered sent to Europe before we ever heard a word from Admiral Sims, except the one line announcing his arrival. Sims sent his first dispatch from London, reviewing the situation, April 14.

Regarding the promptness with which destroyers were ordered to prepare for duty in European waters, I quote the following extracts from Admiral Mayo's testimony:

Destroyer division 8 left Boston 5.30 p. m., en route to Queenstown, Ireland, to cooperate in antisubmarine operations with the British force in Queenstown. (This division sailed April 24.)

April 26.—Orders received to direct six destroyers proceed to home yards to fit out for distant service.
